Motiv ology. If we can uncover a dream's driving motive [*treibendes Motiv*][T], we shall obtain unsuspected information about the repressed impulses [*Regungen*][T] in the unconscious; and on the other hand, if we can undo its distortions, we shall overhear preconscious thought taking place in states of internal reflection which would not have attracted consciousness to themselves during the daytime.

No-one can practise the interpretation of dreams as an isolated activity: it remains a part of the work of analysis. In analysis we direct our interest according to necessity, now to the preconscious content of the dream and now to the unconscious contribution to its formation
Bildung [*Traumbildung*][T]; and we often neglect the one element in favour of the other. Nor would it be of any avail for anyone to endeavour to interpret dreams outside analysis. He would not succeed in escaping the conditions of the analytic situation; and if he worked at his own dreams, he would be undertaking a self-analysis. This comment would not apply to someone who did without the dreamer's collaboration and sought to interpret dreams by intuitive insight. But dream interpretation of such a kind, without reference to the dreamer's associations [*Assoziationen*][T], would in the most favourable case remain a piece of unscientific virtuosity of very doubtful value.

If one practises dream interpretation according to the sole justifiable technical procedure, one soon notices that success depends entirely upon the tension of resistance between the awakened ego and the repressed unconscious. Work under a 'high pressure of resistance' demands (as I have explained elsewhere [p. 100 above]) a different attitude on the part of the analyst from work under a low pressure. In analysis one has for long periods at a time to deal with strong resistances which are still unknown to one and which it will in any case be impossible to overcome so long as they remain unknown. It is therefore not
[129] to be wondered at that only a certain portion of a patient's dream products can be translated and made use of, and, even at that, most often incompletely. Even if, owing to one's own experience, one is in a

position to understand many dreams to the interpretation of which the dreamer has contributed little, one must always remember that the certainty of such interpretations remains in doubt and one hesitates to press one's conjectures upon the patient.

Critical voices will now be raised. It will be objected that, since it is not possible to interpret every dream that is dealt with, one should cease asserting more than one can establish and should be content to say that *some* dreams can be shown by interpretation to have a meaning but that as to the rest we are in ignorance. But the very fact that success in interpretation depends upon the resistance absolves the analyst of the necessity for such modesty. He may have the experience of a dream that was at first unintelligible becoming clear during the very same hour after some fortunate remark has got rid of one of the dreamer's resistances. A portion of the dream which the patient had hitherto forgotten may suddenly occur to him and may bring the key to the interpretation; or a new association may emerge which may throw light upon the darkness. It sometimes happens, too, that, after months or years of analytic labour, one returns to a dream which at the beginning of the treatment seemed meaningless and incomprehensible but which is now, in the light of knowledge obtained in the meantime, completely elucidated.[1] And if one further takes into consideration the argument from the theory of dreams that the model dream products of children invariably have a clear meaning and are easy to interpret,[2] then it will be justifiable to assert that dreams are quite generally mental structures [*Gebilde*] that are capable of interpretation, though the situation may not always allow of an interpretation being reached.

When the interpretation of a dream has been found, it is not always easy to decide whether it is a 'complete' one – that is, whether further preconscious thoughts may not also have found expression in the same dream.[3] In that case we must consider the meaning proved which is [130] based on the dreamer's associations [*Einfälle*] and our estimate of the situation, without on that account feeling bound to reject the other meaning. It remains possible, though unproven; one must become accustomed to a dream being thus capable of having many meanings. Moreover, the blame for this is not always to be laid upon incompleteness of the work of interpretation; it may just as well be inherent in

1 [Cf. a remark by Freud on the length of time required for the interpretation of the 'Wolf Man's' dream (1918*b*), *RSE*, **17**, 29.]

2 [See, however, the qualifying remark added in 1925 to *The Interpretation of Dreams*, ibid., **4**, 113 *n*. 1.]

3 [Cf. ibid., **4**, 248, and **5**, 467 f.]

the latent dream thoughts themselves. Indeed, it may happen in waking life, quite apart from the situation of dream interpretation, that one is uncertain whether some remark that one has heard or some piece of information that one has received is open to construction this way or that, or whether it is hinting at something else beyond its obvious meaning.

One interesting occurrence which has been insufficiently investigated is to be seen where the same manifest dream content gives simultaneous expression to a set of concrete ideas and to an abstract line of thought based upon them. It is of course difficult for the dream-work to find a means for representing abstract thoughts.[1]

1 [See a footnote to the metapsychological paper on dreams (1916–17*f* [1915]), *RSE*, **14**, 203 *n.* 1, and a passage added to *The Interpretation of Dreams* in 1919; ibid., **5**, 468–9.]

(B) MORAL RESPONSIBILITY FOR THE CONTENT OF DREAMS

In the introductory chapter of this book [*The Interpretation of Dreams*] (which discusses 'The Scientific Literature Dealing with the Problem of Dreams')[1] I have shown the way in which writers have reacted to what is felt as the distressing fact that the unbridled content of dreams is so often at odds with the moral sense of the dreamer. (I deliberately avoid speaking of 'criminal' dreams, as such a description, which would overstep the limits of psychological interest, seems to me quite uncalled for.) The immoral character of dreams has naturally provided a fresh motive for denying them any psychical value: if dreams are the meaningless product of disordered mental activity [*Seelentätigkeit*][T], then there can be no ground for assuming responsibility for their apparent content. [131] *Seele*

The problem of responsibility for the manifest content of dreams has been fundamentally shifted and indeed disposed of by the explanations given in my *The Interpretation of Dreams*.

We know now that the manifest content is a deception, a façade. It is not worthwhile to submit it to an ethical examination or to take its breaches of morality any more seriously than its breaches of logic or mathematics. When the 'content' of the dream is spoken of, what must be referred to can only be the content of the preconscious thoughts and of the repressed wishful impulse which are revealed behind the façade of the dream by the work of interpretation. Nevertheless, this immoral façade has a question to put to us. We have heard that the latent dream thoughts have to submit to a severe censorship before they are allowed access to the manifest content. How can it happen, then, that this censorship, which makes difficulties over more trivial things, breaks down so completely over these manifestly immoral dreams?

The answer is not easy to come by and may perhaps not seem completely satisfying. If, in the first place, one submits these dreams to interpretation, one finds that some of them have given no offence to the censorship because *au fond* they have no bad meaning. They are innocent boastings or identifications that put up a mask of pretence; they have not been censored because they do not tell the truth.[2] But [132]

1 [See Section F of that chapter, 'The Moral Sense in Dreams', *RSE*, **4**, 58–65. See also ibid., **5**, 553–5.]

2 [Cf. ibid., **5**, 390.]

others of them – and, it must be admitted, the majority – really mean what they say and have undergone no distortion from the censorship. They are an expression of immoral, incestuous and perverse impulses
Lust or of murderous and sadistic lusts [*Gelüsten*]. The dreamer reacts to many of these dreams by waking up in a fright, in which case the situation is no longer obscure to us. The censorship has neglected its task, this has been noticed too late, and the generation of anxiety [*Angstentwicklung*][T]
Angst is a substitute for the distortion that has been omitted. In still other instances of such dreams, even that expression of affect is absent. The objectionable matter is carried along by the height of the
Erregung sexual excitement [*Sexualerregung*][T] that has been reached during sleep, or it is viewed with the same tolerance with which even a waking person can regard a fit of rage, an angry mood or the indulgence in cruel phantasies.

But our interest in the genesis of these *manifestly* immoral dreams is greatly reduced when we find from analysis that the majority of dreams – innocent dreams, dreams without affect and anxiety dreams – are revealed, when the distortions of the censorship have been undone, as the fulfilments of immoral – egoistic, sadistic, perverse or incestuous – wishful impulses. As in the world of waking life, these masked criminals are far commoner than those with their vizors raised. The straightforward dream of sexual relations with one's mother, which Jocasta alludes to in the *Oedipus Rex*,[1] is a rarity in comparison with all the multiplicity of dreams which psychoanalysis must interpret in the same sense.

I have dealt so exhaustively in these pages [i.e. of *The Interpretation of Dreams*] with this characteristic of dreams, which indeed provides the motive for their distortion, that I can pass at once from this topic to the problem that lies before us: Must one assume responsibility for the content of one's dreams? For the sake of completeness, it should, however, be added that dreams do not always offer immoral wish fulfilments, but often energetic reactions against them in the form of 'punishment dreams'. In other words, the dream censorship can not
[133] only express itself in distortions and the generation of anxiety, but can go so far as to blot out the immoral subject matter completely and replace it with something else that serves as an atonement, though it allows one to see what lies behind.[2] But the problem of responsibility for the immoral content of dreams no longer exists for us as it formerly

1 [Cf. *RSE*, **4**, 234.]

2 [See pp. 107–8 above.]

did for writers who knew nothing of latent dream thoughts and the repressed part of our mental life. Obviously one must hold oneself responsible for the evil impulses of one's dreams. What else is one to do with them? Unless the content of the dream (rightly understood) is inspired by alien spirits, it is a part of my own being. If I seek to classify the impulses that are present in me according to social standards into good and bad, I must assume responsibility for both sorts; and if, in defence, I say that what is unknown, unconscious and repressed in me is not my 'ego',[1] then I shall not be basing my position upon psychoanalysis, I shall not have accepted its conclusions – and I shall perhaps be taught better by the criticisms of my fellow men, by the disturbances in my actions and the confusion of my feelings. I shall perhaps learn that what I am disavowing [*Verleugnete*][T] not only 'is' in me but sometimes 'acts' from out of me as well. *Verleugnung*

It is true that in the metapsychological sense this bad repressed content does not belong to my 'ego' – that is, assuming that I am a morally blameless individual – but to an 'id' ['*Es*'][T] upon which my ego is seated. But this ego developed out of the id, it forms with it a single biological unit, it is only a specially modified peripheral portion of it, and it is subject to the influences and obeys the suggestions that arise from the id. For any vital purpose, a separation of the ego from the id would be a hopeless undertaking.

Moreover, if I were to give way to my moral pride and tried to decree that for purposes of moral valuation I might disregard the evil in the id and need not make my ego responsible for it, what use would that be to me? Experience shows me that I nevertheless *do* take that responsibility, that I am somehow compelled to do so. Psychoanalysis has made us familiar with a pathological condition, obsessional neurosis [*Zwangsneurose*][T], in which the poor ego feels itself responsible for all sorts of [134]
evil impulses of which it knows nothing, impulses which are brought up against it in consciousness but which it is unable to acknowledge. Something of this is present in every normal person. It is a remarkable fact that the more moral he is the more sensitive is his 'conscience'.[2] It is just as though we could say that the healthier a man is, the more liable he is to contagions and to the effects of injuries. This is no doubt because conscience is itself a reaction-formation against the evil that is perceived

1 [As Freud himself points out in the next paragraph, the German '*Ich*' here stands for something more like the English 'self'. This ambiguity in the German usage is discussed in the Editors' Introduction to *The Ego and the Id* (1923*b*), p. 7 above. See also *RSE*, **24**, 68–71.]

2 [This paradox is mentioned on p. 48 above, where footnote 1 gives further references.]

in the id. The more strongly the latter is suppressed, the more active is the conscience.

The ethical narcissism of humanity should rest content with the knowledge that the fact of distortion in dreams, as well as the existence of anxiety dreams and punishment dreams, afford just as clear evidence of his *moral* nature as dream interpretation gives of the existence and strength of his *evil* nature. If anyone is dissatisfied with this and would like to be 'better' than he was created, let him see whether he can attain anything more in life than hypocrisy or inhibition [*Hemmung*][T].

The physician will leave it to the jurist to construct for social purposes a responsibility that is artificially limited to the metapsychological ego. It is notorious that the greatest difficulties are encountered by the attempts to derive from such a construction practical consequences which are not in contradiction to human feelings.

(C) THE OCCULT SIGNIFICANCE OF DREAMS[1]

There seems to be no end to the problems of dream life. But this can [135]
only be surprising if we forget that all the problems of mental life recur in dreams with the addition of a few new ones arising from the special nature of dreams. Many of the things that we study in dreams, because we meet with them there, have nevertheless little or nothing to do with the psychological peculiarity of dreams. Thus, for instance, symbolism is not a dream problem, but a topic connected with our archaic thinking – our 'basic language', as it was aptly called by the paranoic Schreber.[2] It dominates myths and religious ritual no less than dreams, and dream symbolism can scarcely even claim that it is peculiar in that it conceals more particularly things that are important sexually. Again, it is not to be expected that the explanation of anxiety dreams will be found in the theory of dreams. Anxiety is a problem rather of neurosis, and all that remains to be discussed is how it comes about that anxiety can arise under dream conditions.[3]

The position is just the same, I think, in the matter of the relation of dreams to the alleged facts of the occult world. But, since dreams themselves have always been mysterious things, they have been brought into intimate connection with the other unknown mysteries. No doubt, too, they have a historical claim to that position, since in primaeval ages, when our mythology was being formed, dream images may have played a part in the origin of ideas about spirits [*Seelenvorstellungen*][T]. *Vorstellung*

There would seem to be two categories of dreams with a claim to being reckoned as occult phenomena: prophetic dreams and telepathic ones. A countless multitude of witnesses speak in favour of both of them, while against both of them there is the obstinate aversion, or maybe prejudice, of science.

There can, indeed, be no doubt that there are such things as prophetic [136]
dreams, in the sense that their content gives some sort of picture of the future; the only question is whether these predictions coincide to any noticeable extent with what really happens subsequently. I must confess

1 [This subject and much of this actual material were dealt with by Freud at greater length in a posthumously published paper 'Psychoanalysis and Telepathy' (1941*d* [1921]), *RSE*, **18**, as well as in 'Dreams and Telepathy' (1922*a*), ibid., **18**, and in Lecture XXX ('Dreams and Occultism') of his *New Introductory Lectures* (1933*a*), ibid., **22**.]

2 [Cf. the Schreber analysis (1911*c*), ibid., **12**, 21.]

3 [Cf. *The Interpretation of Dreams* (1900*a*), ibid., **5**, 521 and *n*. 1.]

that upon this point my resolution in favour of impartiality deserts me. The notion that there is any mental power [*psychischen Leistung*], apart from acute calculation, which can foresee future events in detail is on the one hand too much in contradiction to all the expectations and presumptions of science and on the other hand corresponds too closely to certain ancient and familiar human desires which criticism must reject as unjustifiable pretensions. I am therefore of the opinion that after one has taken into account the untrustworthiness, credulity and unconvincingness of most of these reports, together with the possibility of falsifications of memory facilitated by emotional causes and the inevitability of a few lucky shots, it may be anticipated that the spectre of veridical prophetic dreams will disappear into nothing. Personally, I have never experienced anything or learnt of anything that could encourage a more favourable presumption.[1]

It is otherwise with telepathic dreams. But at this point it must be made quite clear that no-one has yet maintained that telepathic phenomena – the reception of a mental process by one person from another by means other than sensory perception – are exclusively related to dreams. Thus once again telepathy is not a dream problem: our judgement upon whether or not it exists need not be based on a study of telepathic dreams.

If reports of telepathic occurrences (or, to speak less exactly, of thought transference [*Gedankenübertragung*]) are submitted to the same criticism as stories of other occult events, there remains a considerable amount of material which cannot be so easily neglected. Further, it is much more possible to collect observations and experiences of one's own in this field which justify a favourable attitude to the problem of telepathy, even though they may not be enough to carry an assured conviction. One arrives at a provisional opinion that it may well be that telepathy really exists and that it provides the kernel of truth in many other hypotheses that would otherwise be incredible.

[137] It is certainly right in what concerns telepathy to adhere obstinately to the same sceptical position and to yield only grudgingly to the force of evidence. I believe I have found a class of material which is exempt from the doubts which are otherwise justified – namely, unfulfilled prophecies made by professional fortune-tellers. Unluckily, I have but few such observations at my disposal; but two among these have made

1 [Cf. the posthumously published analysis of an allegedly prophetic dream (1941*c* [1899]). This is printed as Appendix B to *The Interpretation of Dreams*, *RSE*, **5**, 562 ff., and also summarized in *The Psychopathology of Everyday Life* (1901*b*), ibid., **6**, 225–6.]

a powerful impression on me. I am not in a position to describe them in such detail as would produce a similar effect upon other people, and I must restrict myself to bringing out a few essential points.

A prediction had been made, then, to the enquirers (at a strange place and by a strange fortune-teller, who was at the same time carrying out some, presumably irrelevant, ritual) that something would happen to them at a particular time, which in fact did *not* come true. The date at which the prophecy should have been fulfilled was long past. It was striking that those concerned reported their experience not with derision or disappointment but with obvious satisfaction. Included among what had been told them there were certain quite definite details which seemed capricious and unintelligible and would only have been justified if they had hit the mark. Thus, for instance, the palmist told a woman who was twenty-seven (though she looked much younger) and who had taken off her wedding ring that she would be married and have two children before she was thirty-two.[1] The woman was forty-three when, now seriously ill, she told me the story in her analysis: she had remained childless. If one knew her private history (of which the 'Professor' in the lounge of the Paris hotel was certainly ignorant) one could understand the two numbers included in the prophecy. The girl had married after an unusually intense attachment to her father and had then had a passionate longing for children, so as to be able to put her husband in the place of her father. After years of disappointment, when she was on the brink of a neurosis, she obtained the prophecy, which promised her – the lot of her mother. For it was a fact that the latter had had two children by the time she was thirty-two. Thus it was only by the help of psychoanalysis that it was possible to give a significant interpretation of the peculiarities of this pretended message from without. But there was [138] then no better explanation of the whole, unequivocally determined chain of events than to suppose that a strong wish on the part of the questioner – the strongest unconscious wish, in fact, of her whole emotional life and the motive force [*Motor*] of her impending neurosis – had made itself manifest to the fortune-teller by being directly transferred [*Übertragung*] to him while his attention was being distracted by the performances he was going through.[2]

I have often had an impression, in the course of experiments in my private circle, that strongly emotionally coloured recollections can be

1 [This story is told more fully in Lecture XXX of Freud, 1933*a*; *RSE*, **22**, 36 ff., and more fully still in Freud, 1941*d* [1921]; ibid., **18**, 175 ff.]

2 [The significance of this distraction of the fortune-teller's attention is considered in 'Psychoanalysis and Telepathy' (1941*d*), ibid., **18**, 174.]

successfully transferred without much difficulty. If one has the courage to subject to an analytic examination the associations [*Einfälle*] of the person to whom the thoughts are supposed to be transferred, correspondences often come to light which would otherwise have remained undiscovered. On the basis of a number of experiences I am inclined to draw the conclusion that thought transference of this kind comes about particularly easily at the moment at which an idea [*Vorstellung*] emerges from the unconscious, or, in theoretical terms, as it passes over from the 'primary process' to the 'secondary process'.

In spite of the caution which is prescribed by the importance, novelty and obscurity of the subject, I feel that I should not be justified in holding back any longer these considerations upon the problem of telepathy. All of this has only this much to do with dreams: if there are such things as telepathic messages, the possibility cannot be dismissed of their reaching someone during sleep and coming to his knowledge in a dream. Indeed, on the analogy of other perceptual and intellectual material, the further possibility arises that telepathic messages received in the course of the day may only be dealt with during a dream of the following night.[1] There would then be nothing contradictory in the material that had been telepathically communicated being modified and transformed in the dream like any other material. It would be satisfactory if with the help of psychoanalysis we could obtain further and better-authenticated knowledge of telepathy.

1 [Similarly in 'Dreams and Telepathy' (1922*a*), *RSE*, **18**, 210.]

The present translation is a slightly modified reprint of the *SE* version.

This paper was written in February, 1923 (Jones, 1957, 106). The subtitle in parentheses was initially intended as the main title but was then presumably felt by Freud to be too nonspecific (Grubrich-Simitis, 1993). It is essentially, as its subtitle implies, an addition to Freud's *Three Essays on the Theory of Sexuality* (1905*d*); and in fact a new footnote giving the gist of what is put forward here was added to the edition of that work which appeared in the following year (1924), *RSE*, **7**, 177 *n.* 1. The starting point of this paper is mainly from Sections 5 and 6 of the second essay, ibid., 172–6, both of which date only from 1915. But it also takes up ideas that can be found in the paper on 'The Disposition to Obsessional Neurosis' (1913*i*), ibid., **12**, 319–21, as well as many that go back still earlier, to 'On the Sexual Theories of Children' (1908*c*), ibid., **9**, 187–92. The phallic stage – the last of the immature organizations of the libido to be described by Freud – makes its first appearance in this paper.

THE INFANTILE GENITAL ORGANIZATION

(An Interpolation into the Theory of Sexuality)

The difficulty of the work of research in psychoanalysis is clearly shown [141]
by the fact of its being possible, in spite of whole decades of unremitting observation, to overlook features that are of general occurrence and situations that are characteristic, until at last they confront one in an unmistakable form. The remarks that follow are intended to make good a neglect of this sort in the field of infantile sexual development.

Readers of my *Three Essays on the Theory of Sexuality* (1905*d*) will be aware that I have never undertaken any thorough remodelling of that work in its later editions, but have retained the original arrangement and have kept abreast of the advances made in our knowledge by means of interpolations and alterations in the text.[1] In doing this, it may often have happened that what was old and what was more recent did not admit of being merged into an entirely uncontradictory whole. Originally, as we know, the accent was on a portrayal of the fundamental difference between the sexual life of children and of adults; later, the *pregenital organizations* of the libido made their way into the foreground, and also the remarkable and momentous fact of the *diphasic onset* of sexual development. Finally, our interest was engaged by the *sexual researches* of children; and from this we were able to recognize the far-reaching *approximation of the final outcome of sexuality in childhood* (in about the fifth year) to the definitive form taken by it in the adult. This is the point at which I left things in the last (1922) edition of my *Three Essays*.

On p. 63 of that volume[2] I wrote that 'the choice of an object, such as we have shown to be characteristic of the pubertal phase of development, has already frequently or habitually been effected during the years of childhood: that is to say, the whole of the sexual currents have become directed towards a single person in relation to whom they seek [142]

1 [Cf. *RSE*, 7, 112.]

2 [This corresponds to ibid., 7, 176–7, where there can also be found a footnote, added in 1924, which briefly summarizes the findings in the present paper. The whole section of the book from which this passage is quoted had itself only been added to the work in 1915.]

to achieve their aims. This then is the closest approximation possible in childhood to the final form taken by sexual life after puberty. The only difference lies in the fact that in childhood the combination of the
Trieb component drives [*Partialtriebe*][T] and their subordination under the primacy of the genitals have been effected only very incompletely or not at all. Thus the establishment of that primacy in the service of reproduction is the last phase through which the organization of sexuality
Sex [*Sexualorganisation*][T] passes.'

Today I should no longer be satisfied with the statement that in the early period of childhood the primacy of the genitals has been effected only very incompletely or not at all. The approximation of the child's sexual life to that of the adult goes much further and is not limited solely to the coming into being of the choice of an object. Even if a proper combination of the component drives under the primacy of the genitals is not effected, nevertheless, at the height of the course of development of infantile sexuality, interest in the genitals and in their activity acquires a dominating significance which falls little short of that reached in maturity. At the same time, the main characteristic of this 'infantile genital organization' is its *difference* from the final genital organization of the adult. This consists in the fact that, for both sexes, only one genital, namely the male one, comes into account. What is present, therefore, is not a primacy of the genitals, but a primacy of the *phallus*.

Unfortunately we can describe this state of things only as it affects the male child; the corresponding processes in the little girl are not known to us. The small boy undoubtedly perceives the distinction between men and women, but to begin with he has no occasion to connect it with a difference in their genitals. It is natural for him to assume that all other living beings, humans and animals, possess a genital like his own; indeed, we know that he looks for an organ analogous to his own in inanimate things as well.[1] This part of the body, which is easily excitable, prone to changes and so rich in sensations, occupies the boy's interest
[143] to a high degree and is constantly setting new tasks to his drive to research. He wants to see it in other people as well, so as to compare it with his own; and he behaves as though he had a vague idea that this
Kraft organ could and should be bigger. The driving force [*treibende Kraft*][T] which this male portion of the body will develop later at puberty

1 It is, incidentally, remarkable what a small degree of attention the other part of the male genitals, the little sac with its contents, attracts in children. From all one hears in analyses, one would not guess that the male genitals consisted of anything more than the penis. [Cf. the analysis of 'Little Hans' (1909*b*), *RSE*, **10**, 8.]

expresses itself at this period of life mainly as an urge to investigate, as sexual curiosity. Many of the acts of exhibitionism and aggression which children commit, and which in later years would be judged without hesitation to be expressions of lust [*Lüsternheit*][T], prove in analysis to be experiments undertaken in the service of sexual research. *Lust*

In the course of these researches the child arrives at the discovery that the penis is not a possession which is common to all creatures that are like himself. An accidental sight of the genitals of a little sister or playmate provides the occasion for this discovery. In unusually intelligent children, the observation of girls urinating will even earlier have aroused a suspicion that there is something different here. For they will have seen a different posture and heard a different sound, and will have made attempts to repeat their observations so as to obtain enlightenment. We know how children react to their first impressions of the absence of a penis. They disavow the fact[1] and believe that they *do* see [144] a penis, all the same. They gloss over the contradiction between observation and preconception by telling themselves that the penis is still small and will grow bigger presently;[2] and they then slowly come to the emotionally significant conclusion that after all the penis had at least been there before and been taken away afterwards. The lack of a penis is regarded as a result of castration, and so now the child is faced with the task of coming to terms with castration in relation to himself. The further developments are too well known generally to make it necessary to recapitulate them here. But it seems to me that *the significance of the*

1 [From now on, the concept of 'disavowal' comes to occupy a more and more important place in Freud's writings. In the present passage the German word used is '*leugnen*', but its place is later almost invariably taken by the allied form '*verleugnen*'. It appears in a somewhat different connection in the paper on 'The Loss of Reality in Neurosis and Psychosis' (1924*e*), p. 180 below; but usually, as here, the topic concerned is the castration complex. See, for instance, the papers on masochism (1924*c*), p. 156 below, and on the distinction between the sexes (1925*j*), p. 253 below. In his later paper on fetishism (1927*e*), Freud differentiates between the correct use of the words '*Verdrängung*' (repression) and '*Verleugnung*' (disavowal). There, and in the unfinished posthumous paper on 'Splitting of the Ego' (1940*e* [1938]) and in Chapter VIII of the (also posthumous) *Outline* (1940*a* [1938]), the term serves as a basis for an addition to metapsychological theory. Actually, the notion had been hinted at very much earlier – at the end of a long footnote to the paper on 'The Two Principles of Mental Functioning' (1911*b*), *RSE*, **12**, 216 f. *n.* – The word *Verleugnung* has in the past often been translated 'denial' and the associated verb by 'to deny'. These are, however, ambiguous words and it has been thought better to choose 'to disavow' in order to avoid confusion with the German '*verneinen*', used, for instance, in the paper on 'Negation' (1925*h*), p. 237 f. below. This latter German word is, once more in order to avoid ambiguity, there translated by 'to negate'. See *RSE*, **24**, 92, for further discussion of the translation of '*Verleugnung*'.]

2 [Cf. the 'Little Hans' analysis (1909*b*), ibid., **10**, 9 f.]

castration complex can only be rightly appreciated if its origin in the phase of phallic primacy is also taken into account.[1]

We know, too, to what a degree depreciation of women, horror of women, and a disposition to homosexuality are derived from the final conviction that women have no penis. Ferenczi (1923) has recently, with complete justice, traced back the mythological symbol of horror – Medusa's head – to the impression of the female genitals devoid of a penis.[2]

It should not be supposed, however, that the child quickly and readily makes a generalization from his observation that some women have no penis. He is in any case debarred from doing so by his assumption that the lack of a penis is the result of having been castrated as a punishment. On the contrary, the child believes that it is only unworthy female persons that have lost their genitals – females who, in all probability, were guilty of inadmissible impulses [*Regungen*][T] similar to his own. Women
[145] whom he respects, like his mother, retain a penis for a long time. For him, being a woman is not yet synonymous with being without a penis.[3] It is not till later, when the child takes up the problems of the origin and birth of babies, and when he guesses that only women can give birth to them – it is only then that the mother, too, loses her penis. And, along with this, quite complicated theories are built up to explain the exchange of the penis for a baby. In all this, the female genitals never seem to be discovered. The baby, we know, is supposed to live inside the mother's body (in her bowel) and to be born through the intestinal outlet. These last theories carry us beyond the stretch of time covered by the infantile sexual period.

It is not unimportant to bear in mind what transformations are undergone, during the sexual development [*Sexualentwicklung*] of

1 It has been quite correctly pointed out that a child gets the idea of a narcissistic injury through a bodily loss from the experience of losing his mother's breast after sucking, from the daily surrender of his faeces and, indeed, even from his separation from the womb at birth. Nevertheless, one ought not to speak of a castration complex until this idea of a loss has become connected with the male genitals. [This point is treated at greater length in a footnote added in 1923 to the 'Little Hans' analysis, *RSE*, **10**, 7 f. *n.* 3. It is also mentioned in 'The Dissolution of the Oedipus Complex' (1924*d*), p. 169 below.]

2 I should like to add that what is indicated in the myth is the *mother's* genitals. Athene, who carries Medusa's head on her armour, becomes in consequence the unapproachable woman, the sight of whom extinguishes all thought of a sexual approach. – [Freud had himself drafted a short paper on this subject a year earlier, which was published posthumously (1940*c* [1922]), *RSE*, **18**.]

3 I learnt from the analysis of a young married woman who had no father but several aunts that she clung, until quite far on in the latency period, to the belief that her mother and her aunts had a penis. One of her aunts, however, was feeble-minded; and she regarded this aunt as castrated, as she felt herself to be. [Cf. a footnote to *The Ego and the Id*, p. 27 *n.* 1 above.]

childhood, by the polarity of sex [*geschlechtliche Polarität*] with which we are familiar. A first antithesis is introduced with the choice of object, which, of course, presupposes a subject and an object. At the stage of the pregenital sadistic-anal organization, there is as yet no question of male and female; the antithesis between *active* and *passive* is the dominant one.[1] At the following stage of infantile genital organization, which we now know about, *maleness* exists, but not femaleness. The antithesis here is between having *a male genital* and being *castrated*. It is not until development has reached its completion at puberty that the sexual polarity coincides with *male* and *female*. Maleness combines [the factors of] subject, activity and possession of the penis; femaleness takes over [those of] object and passivity. The vagina is now valued as a place of shelter for the penis; it enters into the heritage of the womb.[2]

1 Cf. [a passage added in 1915 to] *Three Essays on the Theory of Sexuality* (1905*d*), *RSE*, **7**, 172. [See further a footnote also added to the same work in 1915; ibid., 194 *n.* 1.]

2 [Grubrich-Simitis (1993) reveals that this striking final sentence was added at the last minute by Freud, at the time of the correction of the galley or page proofs.]

NEUROSIS AND PSYCHOSIS

The present translation is a very slightly revised reprint of the *SE* version.

This was written during the late autumn of 1923. It is an application of the new hypotheses put forward in *The Ego and the Id* to the particular question of the genetic difference between neuroses and psychoses. This same discussion was carried further in another paper, written a few months after the present one, 'The Loss of Reality in Neurosis and Psychosis' (1924*e*), p. 179 ff. below. The roots of the matter were already under discussion by Freud in Section III of his first paper on 'The Neuropsychoses of Defence' (1894*a*), *RSE*, **3**.

In the second paragraph of this paper, Freud speaks of its having been stimulated by 'a train of thought raised in other quarters', p. 141 below. It seems likely that what he was referring to was a work on the psychoanalysis of general paralysis by Hollós & Ferenczi (1922), which had just appeared and to which a theoretical section was contributed by Ferenczi.

NEUROSIS AND PSYCHOSIS

In my recently published work, *The Ego and the Id* (1923*b*), I have proposed a differentiation of the mental [*seelischen*]^{T} apparatus, on the basis of which a number of relationships can be represented in a simple and perspicuous manner. As regards other points – for instance, in what concerns the origin and role of the superego [*Über-Ichs*]^{T} – enough remains obscure and unelucidated. Now one may reasonably expect that a hypothesis of this kind should prove useful and helpful in other directions as well, if only to enable us to see what we already know from another angle, to group it differently and to describe it more convincingly. Such an application of the hypothesis might also bring with it a profitable return from grey theory to the perpetual green of experience.[1] [149] *Seele*

In the work I have mentioned I described the numerous dependent relationships of the ego [*Ichs*]^{T}, its intermediate position between the external world and the id [*Es*]^{T} and its efforts to humour all its masters at once. In connection with a train of thought raised in other quarters, which was concerned with the origin and prevention of the psychoses, a simple formula has now occurred to me which deals with what is perhaps the most important genetic [*genetische*]^{T} difference between a neurosis and a psychosis: *neurosis is the result of a conflict between the ego and its id, whereas psychosis is the analogous outcome of a similar disturbance in the relations between the ego and the external world*.

There are certainly good grounds for being suspicious of such simple solutions to a problem. Moreover, the most that we may expect is that this formula will turn out to be correct in the roughest outline. But even that would be something. One recalls at once, too, a whole

1 [Grau, teurer Freund, ist alle Theorie,
Und grün des Lebens goldner Baum.

My worthy friend, gray is all theory,
And green alone Life's golden tree.

(Trans. Bayard Taylor, emended.)

Mephistopheles in *Faust*, Part I, Scene 4.]

number of discoveries and findings which seem to support our thesis. All our analyses go to show that the transference neuroses [*Übertragungsneurosen*][T] originate from the ego's refusing to accept a powerful drive impulse [*Triebregung*][T] in the id or to help it to find a motor outlet, or from the ego's forbidding that impulse the object at which it is aiming. In such a case the ego defends itself against the drive impulse by the mechanism of repression [*Verdrängung*][T]. The repressed material struggles against this fate [*Schicksal*][T]. It creates for itself, along paths over which the ego has no power [*Macht*][T], a substitutive representation (which forces itself upon the ego by way of a compromise) – the symptom. The ego finds its unity threatened and impaired by this intruder, and it continues to struggle against the symptom, just as it fended off the original drive impulse. All this produces the picture of a neurosis. It is no contradiction to this that, in undertaking the repression, the ego is at bottom following the commands of its superego – commands which, in their turn, originate from influences in the external world that have found representation in the superego. The fact remains that the ego *has* taken sides with those powers, that in it their demands have more strength than the drive demands of the id, and that the ego is the power which sets the repression in motion against the portion of the id concerned and which fortifies the repression by means of the anticathexis of resistance. The ego has come into conflict with the id in the service of the superego and of reality; and this is the state of affairs in every transference neurosis.

Übertragung [150]

Trieb, Regung

On the other side, it is equally easy, from the knowledge we have so far gained of the mechanism of the psychoses, to adduce examples which point to a disturbance in the relationship between the ego and the external world. In Meynert's amentia – an acute hallucinatory confusion which is perhaps the most extreme and striking form of psychosis – either the external world is not perceived at all, or the perception of it has no effect whatever.[1] Normally, the external world governs the ego in two ways: firstly, by current, present perceptions which are always renewable, and secondly, by the store of memories of earlier perceptions which, in the shape of an 'internal world', form a possession of the ego and a constituent part of it. In amentia, not only is the acceptance of new perceptions refused, but the internal world, too, which, as a copy of the external world, has up till now represented it, loses its significance (its cathexis [*Besetzung*][T]). The ego creates,

[151]

1 [A passage in Chapter VIII of Freud's posthumous *Outline of Psychoanalysis* (1940*a* [1938]), *RSE*, **23**, 182, qualifies this statement. Cf. footnote, p. 144 below.]

autocratically, a new external and internal world; and there can be no doubt of two facts – that this new world is constructed in accordance with the id's wishful impulses, and that the motive of this dissociation from the external world is some very serious frustration by reality of a wish [*Wunschversagung*][T] – a frustration which seems intolerable. The close affinity of this psychosis to normal dreams is unmistakable. A precondition of dreaming, moreover, is a state of sleep, and one of the features of sleep is a complete turning away from perception and the external world.[1] *Versagung*

We know that other forms of psychosis, the schizophrenias, are inclined to end in affective hebetude – that is, in a loss of all participation in the external world. In regard to the genesis of delusions, a fair number of analyses have taught us that the delusion is found applied like a patch over the place where originally a rent had appeared in the ego's relation to the external world. If this precondition of a conflict with the external world is not much more noticeable to us than it now is, that is because, in the clinical picture of the psychosis, the manifestations of the pathogenic process are often overlaid by manifestations of an attempt at a cure or a reconstruction.[2]

The aetiology common to the onset of a psychoneurosis and of a psychosis always remains the same. It consists in a frustration, a non-fulfilment, of one of those childhood wishes which are for ever undefeated and which are so deeply rooted in our phylogenetically determined organization. This frustration is in the last resort always an external one;[3] but in the individual case it may proceed from the internal agency (in the superego) which has taken over the representation of the demands of reality. The pathogenic effect depends on whether, in a conflictual tension of this kind, the ego remains true to its dependence on the external world and attempts to silence the id, or whether it lets itself be overcome by the id and thus torn away from reality. A complication is introduced into this apparently simple situation, however, by the existence of the superego, which, through a link that is not yet clear to us, unites in itself influences coming from the [152] id as well as from the external world, and is to some extent an ideal model of what the whole endeavour of the ego is aiming at – a reconciliation between its various dependent relationships.[4] The attitude of

1 [Cf. the metapsychological paper on dreams (1916–17*f* [1915]), *RSE*, **14**.]

2 [Cf. the Schreber analysis (1911*c*), ibid., **12**, 61.]

3 [See some remarks in the discussion of frustration in 'Types of Onset of Neurosis' (1912*c*), ibid., **12**, 230.]

4 [Cf. 'The Economic Problem of Masochism' (1924*c*), p. 158 f. below.]

the superego should be taken into account – which has not hitherto been done – in every form of psychical illness. We may provisionally assume that there must also be illnesses which are based on a conflict between the ego and the superego. Analysis gives us a right to suppose that melancholia is a typical example of this group; and we would set aside the name of 'narcissistic psychoneuroses' for disorders of that kind. Nor will it clash with our impressions if we find reasons for separating states like melancholia from the other psychoses. We now see that we have been able to make our simple genetic formula more complete, without dropping it. Transference neuroses correspond to a conflict between the ego and the id; narcissistic neuroses, to a conflict between the ego and the superego; and psychoses, to one between the ego and the external world. It is true that we cannot tell at once whether we have really gained any new knowledge by this, or have only enriched our store of formulas; but I think that this possible application of the proposed differentiation of the mental apparatus into an ego, a superego and an id cannot fail to give us courage to keep that hypothesis steadily in view.

The thesis that neuroses and psychoses originate in the ego's conflicts with its various ruling agencies – that is, therefore, that they reflect a failure in the functioning of the ego, which is at pains to reconcile all the various demands made on it – this thesis needs to be supplemented in one further point. One would like to know in what circumstances and by what means the ego can succeed in emerging from such conflicts, which are certainly always present, without falling ill. This is a new field of research, in which no doubt the most varied factors will come up for examination. Two of them, however, can be stressed at once. In the first place, the outcome of all such situations will undoubtedly depend on economic considerations – on the relative magnitudes of the trends which are struggling with one another. In the second place, it will be possible for the ego to avoid a rupture in any direction by deforming itself, by submitting to
[153] encroachments on its own unity and even perhaps by effecting a cleavage or division of itself.[1] In this way the inconsistencies, eccentricities and follies of men would appear in a similar light to their sexual perversions, through the acceptance of which they spare themselves repressions.

1 [This is an early hint at a problem that was to occupy Freud in his later years. It was first discussed at length in the paper on 'Fetishism' (1927*e*), *RSE*, **21**, and afterwards in two posthumously published works, in 'Splitting of the Ego in the Process of Defence' (1940*e* [1938]), ibid., **23**, and in Chapter VIII of the *Outline* (1940*a* [1938]), ibid., **23**.]

In conclusion, there remains to be considered the question of what the mechanism, analogous to repression, can be by means of which the ego detaches itself from the external world. This cannot, I think, be answered without fresh investigations; but such a mechanism, it would seem, must, like repression, comprise a withdrawal of the cathexis sent out by the ego.[1]

1 [This problem, too – the nature of what Freud later called '*Verleugnung*', 'disavowal' – was discussed in the later papers mentioned in footnote, p. 144 above. See an Editors' footnote to 'The Infantile Genital Organization', this volume, p. 133 *n.* 1 above, for a fuller discussion of the question.]

THE ECONOMIC PROBLEM OF MASOCHISM

(1924)

The present translation is a slightly revised and corrected reprint of the *SE* version.

This paper was finished before the end of January, 1924 (Jones, 1957, 114).

In this important work Freud gives his fullest account of the puzzling phenomenon of masochism. He had previously dealt with it, but always somewhat tentatively, in his *Three Essays on the Theory of Sexuality* (1905*d*), *RSE*, **7**, 140–2,[1] in the metapsychological paper 'Drives and their Vicissitudes' (1915*c*), ibid., **14**, 111–14, and at much greater length in '"A Child is Being Beaten"' (1919*e*), ibid., **17**, which he himself described in a letter to Ferenczi as 'a paper on masochism'. In all these writings masochism is derived from a previous sadism; no such thing as primary masochism is recognized. (See, for instance, ibid., **14**, 112, and **17**, 188–9.) In *Beyond the Pleasure Principle* (1920*g*), however, after the introduction of the 'death drive', we find a statement that 'there *might* be such a thing as primary masochism'

1 Much of this was in fact only added to the book in 1915; a footnote added in 1924 gives the gist of the present paper.

(*RSE*, **18**, 53), and in the present paper the existence of a primary masochism is taken as certain.[1]

[158] The existence of this primary masochism is here accounted for chiefly on the basis of the 'fusion' and 'defusion' of the two classes of drives – a concept which had been examined at length in *The Ego and the Id* (1923*b*), published less than a year previously – while the apparently self-contradictory nature of a drive which aims at unpleasure is dealt with in the interesting introductory discussion, which for the first time clearly distinguishes between the 'principle of constancy' and the 'pleasure principle'.

Freud's analysis shows that this primary or 'erotogenic' masochism leads to two derivative forms. One of these, which he terms 'feminine', is the form that Freud had already discussed in his paper on 'beating phantasies' (1919*e*). But the third form, 'moral masochism', gives him an opportunity of enlarging upon many points that had been only lightly touched on in *The Ego and the Id*, and of opening up fresh problems in connection with feelings of guilt and the operation of the conscience.

1 It should perhaps be mentioned that it was only in later writings, beginning with Chapter VI of *Civilization and its Discontents* (1930*a*), *RSE*, **21**, that Freud turned his attention more particularly to the *outward* operation of the death drive – to aggressiveness and destructiveness, though it is discussed to some extent in the later part of the present paper.

THE ECONOMIC PROBLEM OF MASOCHISM

The existence of a masochistic trend in the life of the drives [*Triebleben*][T] of human beings may justly be described as mysterious from the economic point of view. For if mental [*seelischen*][T] processes are governed by the pleasure principle in such a way that their first aim is the avoidance of unpleasure [*Unlust*][T] and the obtaining of pleasure [*Lust*], masochism is incomprehensible. If pain [*Schmerz*] and unpleasure can be not simply warnings but actually aims, the pleasure principle is paralysed – it is as though the watchman over our mental life were put out of action by a drug. [159] *Trieb* *Seele*

Thus masochism appears to us in the light of a great danger, which is in no way true of its counterpart, sadism. We are tempted to call the pleasure principle the watchman over our life rather than merely over our mental life. But in that case we are faced with the task of investigating the relationship of the pleasure principle to the two classes of drives which we have distinguished – the death drives and the erotic (libidinal) life drives; and we cannot proceed further in our consideration of the problem of masochism till we have accomplished that task.

It will be remembered that we have taken the view that the principle which governs all mental processes is a special case of Fechner's 'tendency towards stability',[1] and have accordingly attributed to the mental apparatus the purpose of reducing to nothing, or at least of keeping as low as possible, the sums of excitation [*Erregungsumme*][T] which flow in upon it. Barbara Low [1920, 73] has suggested the name of 'Nirvana principle' for this supposed tendency, and we have accepted the term.[2] But we have unhesitatingly identified the pleasure–unpleasure principle with this Nirvana principle. Every unpleasure ought thus to coincide

1 *Beyond the Pleasure Principle* (1920*g*) [*RSE*, **18**, 9].

2 [*Beyond the Pleasure Principle*, ibid., **18**, 53. Freud had previously given this same principle the name of 'the principle of constancy'. A full discussion of the history of Freud's use of these concepts and of their relation to the pleasure principle can be found in an Editors' footnote to 'Drives and their Vicissitudes' (1915*c*), ibid., **14**, 106 f. *n.*]

[160] with a heightening, and every pleasure with a lowering, of mental tension due to stimulus; the Nirvana principle (and the pleasure principle which is supposedly identical to it) would be entirely in the service of the death drives, whose aim is to conduct the restlessness of life into the stability of the inorganic state, and it would have the function of giving warnings against the demands of the life drives – the libido – which try to disturb the intended course of life. But such a view [*Auffassang*][T] cannot be correct. It seems that in the series of feelings of tension we have a direct sense of the increase and decrease of amounts of stimulus, and it cannot be doubted that there are pleasurable tensions and unpleasurable relaxations of tension. The state of sexual excitation is the most striking example of a pleasurable increase of stimulus of this sort, but it is certainly not the only one.

Pleasure and unpleasure, therefore, cannot be referred to an increase or decrease of a quantity (which we describe as 'tension due to stimulus'), although they obviously have a great deal to do with that factor. It appears that they depend, not on this quantitative factor, but on some characteristic of it which we can only describe as a qualitative one. If we were able to say what this qualitative characteristic is, we should be much further advanced in psychology. Perhaps it is the rhythm, the temporal sequence of changes, rises and falls in the quantity of stimulus.[1] We do not know.

However this may be, we must perceive that the Nirvana principle, belonging as it does to the death drive, has undergone a modification in living organisms through which it has become the pleasure principle; and we shall henceforward avoid regarding the two principles as one. It is not difficult, if we care to follow up this line of thought, to guess what power [*Macht*][T] was the source of the modification. It can only be the life drive, the libido, which has thus, alongside of the death drive, seized upon a share in the regulation of the processes of life. In this way we obtain a small but interesting set of connections. The *Nirvana* principle expresses the trend of the death drive; the *pleasure* principle represents the demands of the libido; and the modification of the latter principle, the *reality* principle,[2] represents the influence of the external world.

[161] None of these three principles is actually put out of action [*ausser Kraft*] by another. As a rule they are able to tolerate one another,

1 [This possibility had already been raised in *Beyond the Pleasure Principle* (1920*g*), *RSE*, **18**, 8 and 60.]

2 [Cf. 'Formulations on the Two Principles of Mental Functioning' (1911*b*), ibid., **12**, 216.]

although conflicts are bound to arise occasionally from the fact of the differing aims that are set for each – in one case a quantitative reduction of the load of the stimulus, in another a qualitative characteristic of the stimulus, and, lastly [in the third case], a postponement of the discharge of the stimulus [*Reizabfuhr*][T] and a temporary acquiescence in the unpleasure due to tension. *abführen*

The conclusion to be drawn from these considerations is that the description of the pleasure principle as the watchman over our life cannot be rejected.[1]

To return to masochism. Masochism comes under our observation in three forms: as a condition imposed on sexual excitation, as an expression of the feminine nature, and as a norm of behaviour [*Lebensverhaltens*].[2] We may, accordingly, distinguish an *erotogenic*, a *feminine* and a *moral* masochism. The first, the erotogenic, masochism – pleasure in pain – lies at the bottom of the other two forms as well. Its basis must be sought along biological and constitutional lines and it remains incomprehensible unless one decides to make certain assumptions about matters that are extremely obscure. The third, and in some respects the most important, form assumed by masochism has only recently been recognized by psychoanalysis as a sense of guilt which is mostly unconscious; but it can already be completely explained and fitted into the rest of our knowledge. Feminine masochism, on the other hand, is the one that is most accessible to our observation and least problematical, and it can be surveyed in all its relations. We will begin our discussion with it.

We have sufficient acquaintance with this kind of masochism in men (to whom, owing to the material at my command, I shall restrict my remarks), derived from masochistic – and therefore often impotent – subjects whose phantasies [*Phantasien*][T] either terminate in an act of masturbation or represent a sexual satisfaction in themselves.[3] The real-life performances of masochistic perverts tally completely with these phantasies, whether the performances are carried out as an end in themselves or serve to induce potency and to lead to the sexual act. In both cases – for the performances are, after all, only a carrying out of the phantasies in play – the manifest content is of being gagged, bound, [162]

1 [Freud took up this discussion again in Chapter VIII of his *Outline* (1940*a* [1938]), *RSE*, **23**.]

2 [This last word is also given in English translation in the original.]

3 [See Section VI of "'A Child is Being Beaten'" (1919*e*), *RSE*, **17**, 191 ff.]

painfully beaten, whipped, in some way maltreated, forced into unconditional obedience, dirtied and debased. It is far more rare for mutilations to be included in the content, and then only subject to strict limitations. The obvious interpretation [*Deutung*][T], and one easily arrived at, is that the masochist wants to be treated like a small and helpless child, but, particularly, like a naughty child. It is unnecessary to quote cases to illustrate this; for the material is very uniform and is accessible to any observer, even to non-analysts. But if one has an opportunity of studying cases in which the masochistic phantasies have been especially richly elaborated, one quickly discovers that they place the subject in a characteristically female situation; they signify, that is, being castrated, or copulated with, or giving birth to a baby. For this reason I have called this form of masochism, *a potiori* as it were [i.e. on the basis of its extreme examples], the feminine form, although so many of its features point to infantile life. This superimposed stratification of the infantile and the feminine will find a simple explanation later on. Being castrated – or being blinded, which stands for it – often leaves a negative trace of itself in phantasies, in the condition that no injury is to occur precisely to the genitals or the eyes. (Masochistic tortures, incidentally, rarely make such a serious impression as the cruelties of sadism, whether imagined or performed.) A sense of guilt, too, finds expression in the manifest content of masochistic phantasies; the subject assumes that he has committed some crime (the nature of which is left indefinite) which is to be expiated by all these painful and tormenting procedures. This looks like a superficial rationalization of the masochistic subject matter, but behind it there lies a connection with infantile masturbation. On the other hand, this factor of guilt provides a transition to the third, moral, form of masochism.

This feminine masochism which we have been describing is entirely based on the primary, erotogenic masochism, on pleasure in pain. This cannot be explained without taking our discussion very far back.

[163] In my *Three Essays on the Theory of Sexuality*, in the section on the sources of infantile sexuality, I put forward the proposition that 'in the case of a great number of internal processes sexual excitation arises as a concomitant effect, as soon as the intensity of those processes passes beyond certain quantitative limits'. Indeed, 'it may well be that nothing of considerable importance can occur in the organism without contributing some component to the excitation of the sexual drive'.[1] In

1 [*Three Essays* (1905*d*), *RSE*, 7, 181.]

accordance with this, the excitation of pain and unpleasure would be bound to have the same result, too.[1] The occurrence of such a libidinal sympathetic excitation when there is tension due to pain and unpleasure would be an infantile physiological mechanism which ceases to operate later on. It would attain a varying degree of development in different sexual constitutions; but in any case it would provide the physiological foundation on which the psychical structure of erotogenic masochism would afterwards be erected [*überbaut*].

The inadequacy of this explanation is seen, however, in the fact that it throws no light on the regular and close connections of masochism with its counterpart in the life of the drives, sadism. If we go back a little further, to our hypothesis of the two classes of drives which we regard as operative in the living organism, we arrive at another derivation of masochism, which, however, is not in contradiction with the former one. In (multicellular) organisms the libido meets the drive to death, or destruction, which is dominant in them and which seeks to disintegrate the cellular organism and to conduct each separate unicellular organism [composing it] into a state of inorganic stability (relative though this may be). The libido has the task of making the destroying drive innocuous, and it fulfils the task by diverting that drive to a great extent outwards – soon with the help of a special organic system, the muscular apparatus – towards objects in the external world. The drive is then called the destructive drive, the drive to mastery, or the will to power. A portion of the drive is placed directly in the service of the sexual function, where it has an important part to play. This is sadism proper. Another portion does not share in this transposition outwards; it remains inside the organism and, with the help of the accompanying sexual excitation described above, becomes libidinally bound [*gebunden*] [164] there. It is in this portion that we have to recognize the original, erotogenic masochism.[2]

We are without any physiological understanding of the ways and means by which this taming[3] of the death drive by the libido may be effected. So far as the psychoanalytic field of ideas is concerned, we can only assume that a very extensive fusion and amalgamation [*Vermischung und Verquickung*], in varying proportions, of the two classes

1 [*RSE*, **7**, 181.]

2 [For all of this see Chapter IV of *The Ego and the Id* (p. 36 above). Cf. also another account in Chapter VI of *Beyond the Pleasure Principle* (1920*g*), *RSE*, **18**, 48 f.]

3 ['*Bändigung*.' Freud takes up the word again in the third section of his late paper on 'Analysis Terminable and Interminable' (1937*c*), ibid., **23**, 203 ff. He had much earlier applied the idea to the 'taming' of memories in Section 3 of Part III of his 'Project' of 1895 (Freud, 1950*a*).]

of drives takes place, so that we never have to deal with pure life drives or pure death drives but only with mixtures [*Vermengungen*] of them in different amounts. Corresponding to a fusion of drives of this kind, there may, as a result of certain influences, be a *de*fusion of them. How large the portions of the death drives are which refuse to be tamed in this way by being bound to admixtures of libido we cannot at present guess.

If one is prepared to overlook a little inexactitude, it may be said that the death drive which is operative in the organism – primal sadism – is identical to masochism. After the main portion of it has been transposed outwards on to objects, there remains inside, as a residuum of it, the erotogenic masochism proper, which on the one hand has become a component of the libido and, on the other, still has the self as its object. This masochism would thus be evidence of, and a remainder from, the phase of development in which the coalescence, which is so important for life, between the death drive and Eros took place. We shall not be surprised to hear that in certain circumstances the sadism, or drive to destruction, which has been directed outwards, projected, can be once more introjected, turned inwards, and in this way regress to its earlier situation. If this happens, a secondary masochism is produced, which is added to the original masochism.

[165] Erotogenic masochism accompanies the libido through all its developmental phases and derives from them its changing psychical coatings.[1] The fear of being eaten up by the totem animal (the father) originates from the primitive oral organization; the wish to be beaten by the father comes from the sadistic-anal phase which follows it; castration, although it is later disavowed [*verleugnet*][T], enters into the content of masochistic phantasies as a precipitate of the phallic stage or organization;[2] and from the final genital organization there arise, of course, the situations of being copulated with and of giving birth, which are characteristic of femaleness. The part played in masochism by the nates, too, is easily understandable,[3] apart from its obvious basis in reality. The nates are the part of the body which is given erotogenic preference in the sadistic-anal phase, like the breast in the oral phase and the penis in the genital phase.

Verleugnung

1 [‘*psychischen Umkleidungen*.’ The image is an old one of Freud’s. It occurs several times, for instance, in the ‘Dora’ case history (1905*e*), *RSE*, 7, 73, 74 and 88 *n*. 3.]

2 See ‘The Infantile Genital Organization’ (1923*e*) [p. 133 above, where a footnote discussing the use of the word ‘disavowal’ can also be found].

3 [Cf. a reference to this at the end of Section 4 of the second of the *Three Essays* (1905*d*), *RSE*, 7, 171.]

The third form of masochism, moral masochism,[1] is chiefly remarkable for having loosened its connection with what we recognize as sexuality. All other masochistic sufferings carry with them the condition that they shall emanate from the loved person and shall be endured at his command. This restriction has been dropped in moral masochism. The suffering itself is what matters; whether it is decreed by someone who is loved or by someone who is indifferent is of no importance. It may even be caused by impersonal powers or by circumstances; the true masochist always turns his cheek whenever he has a chance of receiving a blow. It is very tempting, in explaining this attitude, to leave the libido out of account and to confine oneself to assuming that in this case the destructive drive has been turned inwards again and is now raging against the self; yet there must be some meaning in the fact that linguistic usage has not given up the connection between this norm of behaviour and erotism and calls these self-injurers masochists too.

Let us keep to a habit of our technique and consider first the extreme [166]
and unmistakably pathological form of this masochism. I have described elsewhere[2] how in analytic treatment we come across patients to whom, owing to their behaviour towards its therapeutic influence, we are obliged to ascribe an 'unconscious' sense of guilt. I pointed out the sign by which such people can be recognized (a 'negative therapeutic reaction') and I did not conceal the fact that the strength of such an impulse [*Regung*][T] constitutes one of the most serious resistances and the greatest danger to the success of our medical or educative aims. The satisfaction of this unconscious sense of guilt is perhaps the most powerful bastion in the subject's (usually composite) gain from illness – in the sum of forces which struggle against his recovery and refuse to surrender his state of illness. The suffering entailed by neuroses is precisely the factor that makes them valuable to the masochistic trend. It is instructive, too, to find, contrary to all theory and expectation, that a neurosis which has defied every therapeutic effort may vanish if the subject becomes involved in the misery of an unhappy marriage, or loses all his money, or develops a dangerous organic disease. In such instances one form of suffering has been replaced by another; and we see that all that mattered was that it should be possible to maintain a certain amount of suffering.

1 [In a paragraph added in 1909 to *The Interpretation of Dreams* (1900*a*), Freud had proposed the term 'mental masochists' for people 'who find their pleasure, not in having *physical* pain inflicted on them, but in humiliation and mental torture'. (*RSE*, **4**, 141.)]

2 *The Ego and the Id* (1923*b*) [Chapter V, p. 44 f. above].

Patients do not easily believe us when we tell them about the unconscious sense of guilt. They know only too well by what torments – the pangs of conscience – a conscious sense of guilt, a consciousness of guilt, expresses itself, and they therefore cannot admit that they could harbour exactly analogous impulses in themselves without being in the least aware of them. We may, I think, to some extent meet their objection if we give up the term 'unconscious sense of guilt', which is in any case psychologically incorrect,[1] and speak instead of a 'need for punishment', which covers the observed state of affairs just as aptly. We cannot, however, restrain ourselves from judging and localizing this unconscious sense of guilt in the same way as we do the conscious kind.

We have attributed the function of conscience to the superego [*Über-Ich*][T] and we have recognized the consciousness of guilt as an expression [167] of a tension between the ego and the superego.[2] The ego reacts with *Angst* feelings of anxiety [*Angstgefühlen*][T] (conscience anxiety)[3] to the perception that it has not come up to the demands made by its ideal, the superego. What we want to know is how the superego has come to play this demanding role and why the ego, in the case of a difference with its ideal, should have to be afraid.

We have said that the function of the ego is to unite and to reconcile the claims of the three agencies which it serves; and we may add that in doing so it also possesses in the superego a model which it can strive to follow. For this superego is as much a representative of the id [*Es*][T] as of the external world.[4] It came into being through the introjection into the ego of the first objects of the id's libidinal impulses – namely, the two parents. In this process the relation to those objects was desexualized; it was diverted from its direct sexual aims. Only in this way was it possible for the Oedipus complex to be surmounted. The superego retained essential features of the introjected persons – their strength [*Macht*], their severity, their inclination to supervise and to punish. As I have said elsewhere,[5] it is easily conceivable that, thanks to the defusion of drive which occurs along with this introduction into the ego, the severity was increased. The superego – the conscience at work in the ego – may then become harsh, cruel and inexorable against the

1 [Feelings cannot properly be described as 'unconscious'. See Chapter II of *The Ego and the Id*, p. 19 above.]

2 [Ibid., Chapter III, p. 32 above.]

3 ['*Gewissensangst*.' An Editors' footnote discussing this term can be found in Chapter VII of *Inhibitions, Symptoms and Anxiety* (1926*d*), *RSE*, **20**, 114 *n.* 1.]

4 [Cf. 'Neurosis and Psychosis' (1924*b*), p. 143 above.]

5 *The Ego and the Id* [pp. 48–9 above].

ego which is in its charge. Kant's categorical imperative is thus the direct heir of the Oedipus complex.[1]

But the same figures who continue to operate in the superego as the agency we know as conscience after they have ceased to be objects of the libidinal impulses of the id – these same figures also belong to the real external world. It is from there that they were drawn; their power, behind which lie hidden all the influences of the past and of tradition, was one of the most strongly felt manifestations of reality. By virtue of this concurrence, the superego, the substitute for the Oedipus complex, becomes a representative of the real external world as well and thus also becomes a model for the endeavours of the ego.

In this way the Oedipus complex proves to be – as has already been [168]
conjectured in a historical sense[2] – the source of our individual ethical sense, our morality. The course of childhood development leads to an ever-increasing detachment from parents, and their personal significance for the superego recedes into the background. To the imagos[3] they leave behind there are then linked the influences of teachers and authorities, self-chosen models and publicly recognized heroes, whose figures need no longer be introjected by an ego which has become more resistant. The last figure in the series that began with the parents is the dark power of Destiny which only the fewest of us are able to look upon as impersonal. There is little to be said against the Dutch writer Multatuli[4] when he replaces the *Moῖρα* [Destiny] of the Greeks with the divine pair '*Λόγος καὶ 'Ανάγκη* [Reason and Necessity]';[5] but all who transfer [*übertragen*][T] the guidance of the world to Providence, to God, or to God and Nature, arouse a suspicion that they still look upon these ultimate and remotest powers as a parental couple, in a mythological sense, and believe themselves linked to them by libidinal ties. In *The Ego and the Id* [p. 52 above] I made an attempt to derive mankind's

1 [Cf. *The Ego and the Id*, pp. 30 and 43 above.]

2 In Essay IV of *Totem and Taboo* (1912–13*a*).

3 [The term 'imago' was not often used by Freud, especially in his later writings. Its first appearance seems to be in his technical paper on 'The Dynamics of Transference' (1912*b*), *RSE*, **12**, 94, where he attributes it to Jung (1911, 164). In this latter passage Jung tells us that he partly chose the word from the title of a novel of the same name by the Swiss writer Carl Spitteler; and we learn from Hanns Sachs (1945, 63) that the psychoanalytic periodical *Imago*, started by him and Rank in 1912, also owed its title to the same source.]

4 E. D. Dekker (1820–87). ['Multatuli' had long been a favourite of Freud's. He heads the list of 'ten good books' which he drew up in 1906; *RSE*, **9**, 218.]

5 ['*Ανάγκη* had been named by Freud at least as early as in the Leonardo paper (1910*c*), ibid., **11**, 113. *Λόγος*, on the other hand, seems to appear for the first time here. Both are discussed, and more especially *Λόγος*, in *The Future of an Illusion* (1927*c*), ibid., **21**, 50 f.]

realistic fear of death, too, from the same parental view of fate [*Schicksals*][T]. It seems very hard to free oneself from it.

After these preliminaries we can return to our consideration of moral masochism. We have said[1] that, by their behaviour during treatment and in life, the individuals in question give an impression of being morally inhibited [*gehemmt*][T] to an excessive degree, of being under the domination of an especially sensitive conscience, although they are not conscious of any of this ultra-morality. On closer inspection, we can see the difference there is between an unconscious extension of morality of this kind and moral masochism. In the former, the accent falls on the heightened sadism of the superego to which the ego submits; in the latter, it falls on the ego's own masochism which seeks punishment, whether from the superego or from the parental powers outside. We may be forgiven for having confused the two to begin with; for in both cases it is a question of a relationship between the ego and the superego (or powers that are equivalent to it), and in both cases what is involved is a need which is satisfied by punishment and suffering. It can hardly be an insignificant detail, then, that the sadism of the superego becomes for the most part glaringly conscious, whereas the masochistic trend of the ego remains as a rule concealed from the subject and has to be inferred from his behaviour.

Hemmung [169]

The fact that moral masochism is unconscious leads us to an obvious clue. We were able to translate the expression 'unconscious sense of guilt' as meaning a need for punishment at the hands of a parental power. We now know that the wish, which so frequently appears in phantasies, to be beaten by the father stands very close to the other wish, to have a passive (feminine) sexual relation to him and is only a regressive distortion of it. If we insert this explanation into the content of moral masochism, its hidden meaning becomes clear to us. Conscience and morality have arisen through the overcoming, the desexualization, of the Oedipus complex; but through moral masochism morality becomes sexualized once more, the Oedipus complex is revived and the way is opened for a regression from morality to the Oedipus complex. This is to the advantage neither of morality nor of the person concerned [*des Individuums*]. An individual may, it is true, have preserved the whole or some measure of ethical sense alongside of his masochism; but, alternatively, a large part of his conscience may have vanished into his masochism. Again, masochism creates a temptation to perform 'sinful' actions, which must then be expiated by the reproaches of the sadistic

1 [*The Ego and the Id*, p. 44 ff. above.]

conscience (as is exemplified in so many Russian character-types) or by chastisement from the great parental power of Destiny [*Schicksals*]. In order to provoke punishment from this last representative of the parents, the masochist must do what is inexpedient, must act against his own interests, must ruin the prospects which open out to him in the [170] real world and must, perhaps, destroy his own real existence.

The turning back of sadism against the self regularly occurs where a *cultural* [*kulturellen*]^{T} *suppression of the drives* holds back a large part *Kultur* of the subject's destructive drive components from being exercised in life. We may suppose that this portion of the destructive drive which has retreated appears in the ego as an intensification of masochism. The phenomena of conscience, however, lead us to infer that the destructiveness which returns from the external world is also taken up by the superego, without any such transformation, and increases its sadism against the ego. The sadism of the superego and the masochism of the ego supplement each other and unite to produce the same effects. It is only in this way, I think, that we can understand how the suppression of a drive can – frequently or quite generally – result in a sense of guilt and how a person's conscience becomes more severe and more sensitive the more he refrains from aggression against others.[1] One might expect that if a man knows that he is in the habit of avoiding the commission of acts of aggression that are undesirable from a cultural standpoint he will for that reason have a good conscience and will watch over his ego less suspiciously. The situation is usually presented as though ethical requirements were the primary thing and the renunciation of drive followed from them. This leaves the origin of the ethical sense unexplained. Actually, it seems to be the other way about. The first drive renunciation is enforced by external powers, and it is only this which creates the ethical sense, which expresses itself in conscience and demands a further renunciation of drive.[2]

Thus moral masochism becomes a classical piece of evidence for the existence of fusion of drive. Its danger lies in the fact that it originates from the death drive and corresponds to the part of that drive which has escaped being turned outwards as a drive to destruction. But since, on the other hand, it has the significance of an erotic component, even the subject's [*der Person*]^{T} destruction of himself cannot take place without libidinal satisfaction.[3]

1 [Cf. *The Ego and the Id*, p. 48 above.]

2 [The subjects discussed in this paragraph were enlarged upon by Freud in Chapter VII of *Civilization and its Discontents* (1930*a*), *RSE*, **21**.]

3 [Freud discussed masochism in relation to psychoanalytic treatment once more in Section VI of his paper on 'Analysis Terminable and Interminable' (1937*c*), ibid., **23**.]

THE DISSOLUTION OF THE OEDIPUS COMPLEX

This paper, written in March, 1924 (Grubrich-Simitis, 1993), was in its essence an elaboration of a passage in *The Ego and the Id* (p. 27 ff. above). It further claims our special interest as laying emphasis for the first time on the different course taken by the development of sexuality in boys and in girls. This fresh line of thought was carried further some eighteen months later in Freud's paper on 'Some Psychical Consequences of the Anatomical Distinction between the Sexes' (1925*j*). The history of Freud's changing views on this subject is discussed in an Editors' Note to the latter paper (p. 245 ff. below).

THE DISSOLUTION[1] OF THE OEDIPUS COMPLEX

To an ever-increasing extent the Oedipus complex reveals its importance as the central phenomenon of the sexual period of early childhood. After that, its dissolution takes place; it succumbs to repression [*Verdrängung*][T], as we say, and is followed by the latency period. It has not yet become clear, however, what it is that brings about its collapse [*zugrunde geht*]. Analyses seem to show that it is the experience of painful disappointments. The little girl likes to regard herself as what her father loves above all else; but the time comes when she has to endure a harsh punishment from him and she is cast out of her fool's paradise. The boy regards his mother as his own property; but he finds one day that she has redirected her love and solicitude to a new arrival. Reflection must deepen our sense of the importance of those influences, for it will emphasize the fact that distressing experiences of this sort, which act in opposition to the content of the complex, are inevitable. Even when no special events occur, like those we have mentioned as examples, the absence of the satisfaction hoped for, the continued denial [*Versagung*][T] of the desired baby, must in the end lead the small lover to turn away from his hopeless longing. In this way the Oedipus complex would collapse from its lack of success, from the effects of its internal impossibility. [173]

Another view [*Auffassung*][T] is that the Oedipus complex must collapse because the time has come for its disintegration [*Auflösung*], just as the milk-teeth fall out when the permanent ones begin to grow.

1 ['*Untergang*.'[t] We learn from Ernest Jones (1957, 114) that Ferenczi, in a letter of March 24, 1926, objected to the strength of this word and suggested that it was chosen as a reaction to Rank's ideas on the importance of the 'birth trauma'. Freud, replying two days later, 'admitted that the word in the title might have been emotionally influenced by his feelings about Rank's new ideas, but said that the paper itself was quite independent of the latter' (Jones, ibid.). It must be pointed out, indeed, that the phrase '*Untergang des Ödipuskomplexes*' had in fact been used twice by Freud in *The Ego and the Id*, which was written before the publication of Rank's hypothesis. (See above, pp. 28 and 29.) In the same passage he had in fact also used the still stronger word '*Zertrümmerung* (disintegration)', p. 27. See also p. 171 below, and the discussion of the translation of '*Untergang*' in *RSE*, **24**, 126–7, where Freud's letter to Ferenczi is quoted in order to clarify what he intended his use of this word to imply.]

[174] Although the majority of human beings go through the Oedipus complex as an individual experience, it is nevertheless a phenomenon which is determined and laid down by heredity and which is bound to pass away according to programme when the next preordained phase of development sets in. This being so, it is of no great importance what the occasions are which allow this to happen, or, indeed, whether any such occasions can be discovered at all.[1]

The justice of both these views cannot be disputed. Moreover, they are compatible. There is room for the ontogenetic view side by side with the more far-reaching phylogenetic one. It is also true that even at birth the whole individual is destined to die, and perhaps his organic disposition may already contain the indication of what he is to die from. Nevertheless, it remains of interest to track how this innate programme is carried out and in what way accidental noxae exploit his disposition.

We have lately[2] been made more clearly aware than before that a child's sexual development advances to a certain phase at which the genital organ has already taken over the leading role. But this genital is the male one only, or, more correctly, the penis; the female genital has remained undiscovered. This phallic phase, which is contemporaneous with the Oedipus complex, does not develop further to the definitive genital organization, but is submerged, and is succeeded by the latency period. Its termination, however, takes place in a typical manner and in conjunction with events that are of regular recurrence.

When the (male) child's interest turns to his genitals he betrays the fact by manipulating them frequently; and he then finds that the adults do not approve of this behaviour. More or less plainly, more or less brutally, a threat is pronounced that this part of him which he values so highly will be taken away from him. Usually it is from women that the threat emanates; very often they seek to strengthen their authority by a reference to the father or the doctor, who, so they say, will carry out the
[175] punishment. In a number of cases the women will themselves mitigate the threat in a symbolic manner by telling the child that what is to be removed is not his genital, which actually plays a passive part, but his hand, which is the active culprit. It happens particularly often that the little boy is threatened with castration, not because he plays with his penis with his hand, but because he wets his bed every night and cannot

1 [The ideas contained in this and the preceding paragraph had been expressed by Freud in very similar terms in Section IV of "'A Child is Being Beaten'" (1919*e*), *RSE*, **17**, 183 f.]

2 [See 'The Infantile Genital Organization' (1923*e*), p. 131 ff. above.]

be got to be clean. Those in charge of him behave as if this nocturnal incontinence was the result and the proof of his being unduly concerned with his penis, and they are probably right.[1] In any case, long-continued bedwetting is to be equated with the emissions of adults. It is an expression of the same excitation of the genitals which has impelled the child to masturbate at this period.

Now it is my view that what brings about the destruction of the child's phallic genital organization is this threat of castration. Not immediately, it is true, and not without other influences being brought to bear as well. For to begin with the boy does not believe in the threat or obey it in the least. Psychoanalysis has recently attached importance to two experiences which all children go through and which, it is suggested, prepare them for the loss of highly valued parts of the body. These experiences are the withdrawal of the mother's breast – at first intermittently and later for good – and the daily demand on them to give up the contents of the bowel. But there is no evidence to show that, when the threat of castration takes place, those experiences have any effect.[2] It is not until a *fresh* experience comes his way that the child begins to reckon with the possibility of being castrated, and then only hesitatingly and unwillingly, and not without making efforts to depreciate the significance of something he has himself observed.

The observation which finally breaks down his unbelief is the sight of the female genitals. Sooner or later the child, who is so proud of [176]
his possession of a penis, has a view of the genital region of a little girl, and cannot help being convinced of the absence of a penis in a creature who is so like himself. With this, the loss of his own penis becomes imaginable, and the threat of castration takes its deferred [*nachträglich*][T] effect. *Nachträglichkeit*

We should not be as short-sighted as the person in charge of the child who threatens him with castration, and we must not overlook the fact that at this time masturbation by no means represents the whole of his sexual life. As can be clearly shown, he stands in the Oedipus attitude to his parents; his masturbation is only a genital discharge [*Abfuhr*][T] of *abführen*
the sexual excitation [*Sexualerregung*][T] belonging to the complex, and *Erregung*

1 [Cf. the case history of 'Dora' (1905*e*), *RSE*, **7**, 66, and the second of the *Three Essays* (1905*d*), ibid., 168.]

2 [Cf. a footnote added, at about the time this paper was written, to the case history of 'Little Hans' (1909*b*), ibid., **10**, 7 f. *n.* 3, in which reference is made to papers by Andreas-Salomé (1916), A. Stärcke (1921) and Alexander (1922). A third experience of separation – that of birth – is also mentioned there, but, as in the present passage, Freud objects to the confusion with the castration complex. Cf. also a footnote to 'The Infantile Genital Organization' (1923*e*), p. 134 *n.* 1 above.]

throughout his later years will owe its importance to that relationship. The Oedipus complex offered the child two possibilities of satisfaction, an active and a passive one. He could put himself in his father's place in a masculine fashion and have intercourse with his mother as his father did, in which case he would soon have felt the latter as a hindrance; or he might want to take the place of his mother and be loved by his father, in which case his mother would become superfluous. The child may have had only very vague notions as to what constitutes a satisfying erotic intercourse; but certainly the penis must play a part in it, for the sensations in his own organ were evidence of that. So far he had had no occasion to doubt that women possessed a penis. But now his acceptance of the possibility of castration, his recognition that women were castrated, made an end of both possible ways of obtaining satisfaction from the Oedipus complex. For both of them entailed the loss of his penis – the masculine one as a resulting punishment and the feminine one as a precondition. If the satisfaction of love in the field of the Oedipus complex is to cost the child his penis, a conflict is bound to arise between his narcissistic interest in that part of his body and the libidinal cathexis [*Besetzung*]^{T} of his parental objects. In this conflict the first of these forces [*Macht*]^{T} normally triumphs: the child's ego turns away from the Oedipus complex.

I have described elsewhere how this turning away takes place.[1] The object cathexes are given up and replaced by identifications. The authority of the father or the parents is introjected into the ego, and there it forms the nucleus of the superego [*Über-Ichs*]^{T}, which takes over the
[177] severity of the father and perpetuates his prohibition against incest, and so secures the ego from the return of the libidinal object cathexis. The libidinal trends belonging to the Oedipus complex are in part desexualized and sublimated (a thing which probably happens with every transformation into an identification) and in part inhibited in
Hemmung their aim [*zielgehemmt*]^{T} and changed into impulses of affection. The whole process has, on the one hand, preserved the genital organ – has averted the danger of its loss – and, on the other, has paralysed it – has removed its function. This process ushers in the latency period, which now interrupts the child's sexual development.

I see no reason for denying the name of a 'repression' to the ego's turning away from the Oedipus complex, although later repressions come about for the most part with the participation of the superego, which in this case is only just being formed. But the process we have

1 [In Chapter III of *The Ego and the Id*, p. 25 ff. above.]

described is more than a repression. It is equivalent, if it is ideally carried out, to a destruction [*Zerstörung*] and an abolition [*Aufhebung*] of the complex. We may plausibly assume that we have here come upon the borderline – never a very sharply drawn one – between the normal and the pathological. If the ego has in fact not achieved much more than a *repression* of the complex, the latter persists in an unconscious state in the id and will later manifest its pathogenic effect.

Analytic observation enables us to recognize or guess these connections between the phallic organization, the Oedipus complex, the threat of castration, the formation of the superego and the latency period. These connections justify the statement that the collapse of the Oedipus complex is brought about by the threat of castration. But this does not dispose of the problem; there is room for a theoretical speculation which may upset the results we have come to or put them in a new light. Before we start along this new path, however, we must turn to a question which has arisen in the course of this discussion and has so far been left on one side. The process which has been described refers, as has been expressly said, to male children only. How does the corresponding development take place in little girls?

At this point our material – for some incomprehensible reason[1] – becomes far more obscure and full of gaps. The female sex, too, develops an Oedipus complex, a superego and a latency period. May [178] we also attribute a phallic organization and a castration complex to it? The answer is in the affirmative; but these things cannot be the same as they are in boys. Here the feminist demand for equal rights for the sexes does not take us far, for the morphological distinction is bound to find expression in differences of psychical development.[2] 'Anatomy is Destiny', to vary a saying of Napoleon's. The little girl's clitoris behaves just like a penis to begin with; but, when she makes a comparison with a playfellow of the other sex, she perceives that she has 'come off badly'[3] and she feels this as a wrong done to her and as a ground for inferiority. For a while still she consoles herself with the expectation that later on, when she grows older, she will acquire just

1 [Freud suggested some explanation for this in Section I of his paper on 'Female Sexuality' (1931*b*), *RSE*, **21**.]

2 [See Freud's paper, written about eighteen months after this one, on 'Some Psychical Consequences of the Anatomical Distinction between the Sexes' (1925*j*), p. 249 ff. below. Much of what follows is elaborated there. The paraphrase of Napoleon's epigram had appeared already in the second paper on the psychology of love (1912*d*), *RSE*, **11**, 176.]

3 [Literally 'come off too short'.]

as big an appendage as the boy's. Here the masculinity complex[1] of women branches off. A female child, however, does not understand her lack of a penis as being a sex character; she explains it by assuming that at some earlier date she had possessed an equally large organ and had then lost it by castration. She seems not to extend this inference from herself to other, adult females, but, entirely on the lines of the phallic phase, to regard them as possessing large and complete – that is to say, male – genitals. The essential difference thus comes about that the girl accepts castration as an accomplished fact, whereas the boy fears the possibility of its occurrence.

The fear of castration being thus excluded in the little girl, a powerful motive also drops out for the setting up of a superego and for the breaking off of the infantile genital organization. In her, far more than in the boy, these changes seem to be the result of upbringing and of intimidation from outside which threatens her with a loss of love. The girl's Oedipus complex is much simpler than that of the small bearer of the penis; in my experience, it seldom goes beyond the taking of her mother's place and the adopting of a feminine attitude towards her father. Renunciation of the penis is not tolerated by the girl without
[179] some attempt at compensation. She slips – along the line of a symbolic equation, one might say – from the penis to a baby. Her Oedipus complex culminates in a desire, which is long retained, to receive a baby from her father as a gift – to bear him a child.[2] One has an impression that the Oedipus complex is then gradually given up because this wish is never fulfilled. The two wishes – to possess a penis and a child – remain strongly cathected in the unconscious and help to prepare the female creature for her later sexual role. The comparatively lesser strength of the sadistic contribution to her sexual drive, which we may no doubt connect with the stunted growth of her penis, makes it easier in her case for the direct sexual trends to be transformed into aim-inhibited trends of an affectionate kind. It must be admitted, however, that in general our insight into these developmental processes in girls is unsatisfactory, incomplete and vague.[3]

I have no doubt that the chronological and causal relations described here between the Oedipus complex, sexual intimidation (the threat of

1 [Cf. below, p. 253 and *n.* 3.]

2 [Cf. Freud's paper on 'Transformations of Drive' (1916–17*e*), *RSE*, **17**, 116 ff.; see also below, p. 256.]

3 [Freud discussed this topic much more fully in his papers on the anatomical distinction between the sexes (1925*j*), p. 249 ff. below, and on female sexuality (1931*b*), *RSE*, **21**, 215 ff., in both of which he gave a very different account of the girl's Oedipus complex from the present one.]

castration), the formation of the superego and the beginning of the latency period are of a typical kind; but I do not wish to assert that this type is the only possible one. Variations in the chronological order and in the linking up of these events are bound to have a very important bearing on the development of the individual.

Since the publication of Otto Rank's interesting[1] study, *The Trauma of Birth* [1924], even the conclusion arrived at by this modest investigation, to the effect that the boy's Oedipus complex collapses due to the fear of castration, cannot be accepted without further discussion. Nevertheless, it seems to me premature to enter into such a discussion at the present time, and perhaps inadvisable to begin a criticism or an appreciation of Rank's view at this juncture.[2]

1 [Grubrich-Simitis (1993, 217; trans., 170) reports that Freud had initially used the word 'fascinating' in the manuscript, but a change in his attitude took place during the early months of 1924, resulting in the change of word. See also p. 167 *n.* above.]

2 [The question was taken up by Freud soon afterwards in *Inhibitions, Symptoms and Anxiety* (1926*d*). Cf. Section (*e*) of the Editors' Introduction to that work, *RSE*, **20**, 74 f.]

THE LOSS OF REALITY IN NEUROSIS AND PSYCHOSIS

(1924)

EDITORS' NOTE

DER REALITÄTSVERLUST BEI NEUROSE UND PSYCHOSE

1961 *SE*, **19**, 183–7. (Translation based on that of 1924.)
1979 *PFL*, **10**, 219–26. (Reprint of the *SE* translation.)

According to a statement in a footnote to the English translation (*CP*, **2**, 277), it was actually published before the German original. The present translation is a slightly revised and corrected reprint of the *SE* version.

This paper was written by the end of May, 1924, for it was read by Abraham during that month. It continues the discussion begun in the earlier paper 'Neurosis and Psychosis' (1924*b*), p. 141 ff. above, which it amplifies and corrects. Some doubts about the validity of the distinction drawn in these two papers were discussed by Freud later, in his paper on 'Fetishism' (1927*e*), *RSE*, **21**.

THE LOSS OF REALITY IN NEUROSIS AND PSYCHOSIS

I have recently[1] indicated as one of the features which differentiate a neurosis from a psychosis the fact that in a neurosis the ego [*Ich*][T], in its dependence on reality, suppresses a piece of the id [*Es*][T] (of drive activity [*Trieblebens*][T]), whereas in a psychosis, this same ego, in the service of the id, withdraws from a piece of reality. Thus for a neurosis the decisive factor would be the predominance of the influence of reality, whereas for a psychosis it would be the predominance of the id. In a psychosis, a loss of reality would necessarily be present, whereas in a neurosis, it would seem, this loss would be avoided. [183] *Trieb*

But this does not at all agree with the observation which all of us can make that every neurosis disturbs the patient's relation to reality in some way, that it serves him as a means of withdrawing from reality, and that, in its severe forms, it actually signifies a flight from real life. This contradiction seems a serious one; but it is easily resolved, and the explanation of it will in fact help us to understand neuroses.

For the contradiction exists only as long as we keep our eyes fixed on the situation at the *beginning* of the neurosis, in which the ego, in the service of reality, sets about the repression [*Verdrängung*][T] of a drive impulse [*Triebregung*][T]. This, however, is not yet the neurosis itself. The neurosis consists rather in the processes which provide a compensation for the portion of the id that has been damaged – that is to say, in the reaction against the repression and in the failure of the repression. The loosening of the relation to reality is a consequence of this second step in the formation of a neurosis, and it ought not to surprise us if a detailed examination shows that the loss of reality affects precisely that piece of reality as a result of whose demands the drive repression ensued. *Regung*

1 'Neurosis and Psychosis' (1924*b*) [this volume, p. 141 ff.].

There is nothing new in our characterization of neurosis as the result of a repression that has failed. We have said this all along,[1] and it is only because of the new context in which we are viewing the subject that it has been necessary to repeat it.

[184] Incidentally, the same objection arises in a specially marked manner when we are dealing with neurosis in which the exciting cause (the 'traumatic scene') is known, and in which one can see how the person concerned turns away from the experience and consigns it to amnesia. Let me go back by way of example to a case analysed a great many years ago,[2] in which the patient, a young woman, was in love with her brother-in-law. Standing beside her sister's deathbed, she was horrified at having the thought: 'Now he is free and can marry me.' This scene was instantly forgotten, and thus the process of regression,[3] which led to her hysterical pains, was set in motion. It is instructive precisely in this case, moreover, to learn along what path the neurosis attempted to solve the conflict. It took away from the value of the change that had occurred in reality, by repressing the drive demand which had emerged – that is, her love for her brother-in-law. The *psychotic* reaction would have been a disavowal[4] of the fact of her sister's death.

We might expect that when a psychosis comes into being, something analogous to the process in a neurosis occurs, though, of course, between different agencies of the mind; thus we might expect that in a psychosis, too, two steps could be discerned, of which the first would drag the ego away, this time from reality, while the second would try to make good the damage done and re-establish the subject's relations to reality at the expense of the id. And, in fact, some analogy of the sort can be observed in a psychosis. Here, too, there are two steps, the second of which has the character of a reparation. But beyond that the analogy gives way to a far more extensive similarity between the two processes. The second step of the psychosis is indeed intended to make

[185] good the loss of reality, not, however, at the expense of a restriction of the id – as happens in neurosis at the expense of the relation to reality – but in another, more autocratic manner, by the creation of a new

1 [The notion that the 'return of the repressed' constitutes 'the illness proper' is already stated in Draft K of the Fliess correspondence, of January 1, 1896 (Freud, 1950*a*). A little later Freud restated this, using the actual words 'failure of defence' as equivalent to 'return of the repressed', in Section II of the second paper on 'The Neuropsychoses of Defence' (1896*b*); cf. *RSE*, **3**, 179.]

2 In *Studies on Hysteria* (1895*d*). [Ibid., **2**, 139 and 148. The words of the patient, Frau Elisabeth von R., are not here quoted verbatim.]

3 [The German word is '*Regression*', not '*Verdrängung*' ('repression'), in all editions.]

4 [See Editors' footnote to 'The Infantile Genital Organization' (1923*e*), p. 133 *n.* 1 above.]

reality which no longer raises the same objections as the old one that has been given up. The second step, therefore, both in neurosis and psychosis, is supported by the same trends. In both cases it serves the desire for power of the id, which will not allow itself to be dictated to by reality. Both neurosis and psychosis are thus the expression of a rebellion on the part of the id against the external world, of its unwillingness – or, if one prefers, its incapacity – to adapt itself to the exigencies of reality, to *'Ανάγκη* [Necessity].[1] Neurosis and psychosis differ from each other far more in their first, introductory, reaction than in the attempt at reparation which follows it.

Accordingly, the initial difference is expressed thus in the final outcome: in neurosis a piece of reality is avoided by a sort of flight, whereas in psychosis it is remodelled. Or we might say: in psychosis, the initial flight is succeeded by an active phase of remodelling; in neurosis, the initial obedience is succeeded by a deferred [*nachträglicher*][T] attempt at flight. Or again, expressed in yet another way: neurosis does not disavow the reality, it only ignores it; psychosis disavows it and tries to replace it. We call behaviour 'normal' or 'healthy', if it combines certain features of both reactions – if it disavows the reality as little as does a neurosis, but if it then exerts itself, as does a psychosis, to effect an alteration of that reality. Of course, this expedient, normal, behaviour leads to work being carried out on the external world; it does not stop, as in psychosis, at effecting internal changes. It is no longer *autoplastic* but *alloplastic*.[2]

Nachträglichkeit

In a psychosis, the transforming of reality is carried out upon the psychical precipitates of former relations to it – that is, upon the memory traces, ideas and judgements which have been previously derived from reality and by which reality was represented in the mind. But this relation was never a closed one; it was continually being enriched and altered by fresh perceptions. Thus the psychosis is also faced with the task of procuring for itself perceptions of a kind which shall correspond to the new reality; and this is most radically effected by means of hallucination. The fact that, in so many forms and cases of psychosis, the paramnesias, the delusions and the hallucinations that occur are of a most distressing character and are bound up with a generation of anxiety [*Angstentwicklung*][T] – this fact is without doubt a sign that the whole process of remodelling is carried through against forces which

[186]

Angst

1 [See 'The Economic Problem of Masochism' (1924*c*), p. 159 above.]

2 [These terms are possibly due to Ferenczi, who used them in a paper on 'The Phenomena of Hysterical Materialization' (1919*b*, 24; English trans., 1926, 97). But he there appears to attribute them to Freud, who, however, does not seem to have used them elsewhere than in this passage.]

oppose it violently. We may construct the process on the model of a neurosis, with which we are more familiar. There we see that a reaction of anxiety sets in whenever the repressed drive makes a thrust forward, and that the outcome of the conflict is only a compromise and does not provide complete satisfaction. Probably in a psychosis the rejected piece
Seele of reality constantly forces itself upon the mind [*Seelenleben*][T], just as the repressed drive does in a neurosis, and that is why in both cases the consequences too are the same. The elucidation of the various mechanisms which are designed, in the psychoses, to turn the subject away from reality and to reconstruct reality – this is a task for specialized psychiatric study which has not yet been taken in hand.[1]

There is, therefore, a further analogy between a neurosis and a psychosis, in that in both of them the task which is undertaken in the second step is partly unsuccessful. For the repressed drive is unable to procure a full substitute (in neurosis); and the representation of reality cannot be remoulded into satisfying forms (not, at least, in every species of mental illness). But the emphasis is different in the two cases. In a psychosis it falls entirely on the first step, which is pathological in itself and cannot but lead to illness. In a neurosis, on the other hand, it falls on the second step, on the failure of the repression, whereas the first step may succeed, and does succeed in innumerable instances without overstepping the bounds of health – even though it does so at a certain price and not without leaving behind traces of the psychical expenditure it has called for. These distinctions, and perhaps many others as well, are a result of the topographical difference in the initial situation of the
[187] pathogenic conflict – namely whether in it the ego yielded to its allegiance to the real world or to its dependence on the id.

A neurosis usually contents itself with avoiding the piece of reality in question and protecting itself against coming into contact with it. The sharp distinction between neurosis and psychosis, however, is weakened by the circumstance that in neurosis, too, there is no lack of attempts to replace a disagreeable reality with one which is more in keeping with the subject's wishes. This is made possible by the existence of a *world*
Phantasie *of phantasy* [*Phantasiewelt*][T], of a domain which became separated from the real external world at the time of the introduction of the reality principle. This domain has since been kept free from the demands of the exigencies of life, like a kind of 'reservation';[2] it is not inaccessible

1 [Cf., however, some beginnings made by Freud himself in the case of paranoia (1911*c*), *RSE*, **12**, 60–2, and of 'paraphrenia' (1914*c*), ibid., **14**, 64, 74–5, 179–80 and 204 f.]

2 [Cf. the paper on the 'Two Principles of Mental Functioning' (1911*b*), ibid., **12**, 218 and *n*. 3.]

to the ego, but is only loosely attached to it. It is from this world of phantasy that the neurosis draws the material for its new wishful constructions, and it usually finds that material along the path of regression to a more satisfying real past.

It can hardly be doubted that the world of phantasy plays the same part in psychosis and that there, too, it is the storehouse from which the materials or the pattern for building the new reality are derived. But whereas the new, imaginary external world of a psychosis attempts to put itself in the place of external reality, that of a neurosis, on the contrary, is apt, like the play of children, to attach itself to [*lehnt sich an*][T] *Anlehnung* a piece of reality – a different piece from the one against which it has to defend itself – and to lend that piece a special importance and a secret meaning which we (not always quite appropriately) call a *symbolic* one. Thus we see that both in neurosis and psychosis there comes into consideration the question not only of a *loss of reality* but also of a *substitute for reality*.

A SHORT ACCOUNT OF PSYCHOANALYSIS

(1924 [1923])

EDITORS' NOTE

KURZER ABRISS DER PSYCHOANALYSE

GERMAN EDITIONS

1986 *PFL*, **15**, 159–82. (Reprint of above.)

The present translation is a slightly revised and corrected reprint of the *SE* version.

We learn from Ernest Jones (1957, 114) that this was written by Freud, at the request of the American publishers, in October and November, 1923. This work is to be distinguished from the article written some two years later for the *Encyclopaedia Britannica* itself (1926*f*). The original German text, with a less exciting title than the American one, was published for the first time in 1928. Grubrich-Simitis (1993, 212; trans., 166) tells us that the manuscript title was originally '*Die Geschichte der Psychoanalyse*' ('The History of Psychoanalysis') until galley or proof stage.

A SHORT ACCOUNT OF PSYCHOANALYSIS

I

Psychoanalysis may be said to have been born with the twentieth century; for the publication in which it emerged before the world as something new – my *The Interpretation of Dreams* – bears the date '1900'.[1] But, as may well be supposed, it did not drop from the skies ready-made. It had its starting point in older ideas, which it developed further; it sprang from earlier suggestions, which it elaborated. Any history of it must therefore begin with an account of the influences which determined its origin and should not overlook the times and circumstances that preceded its creation. [191]

Psychoanalysis grew up in a narrowly restricted field. At the outset, it had only a single aim – that of understanding something of the nature of what were known as the 'functional' nervous diseases, with a view to overcoming the impotence which had so far characterized their medical treatment. The neurologists of that period had been brought up to have a high respect for chemicophysical and pathologico-anatomical facts; and they were latterly under the influence of the findings of Hitzig and Fritsch, of Ferrier, Goltz and others, who seemed to have established an intimate and possibly exclusive connection between certain functions and particular parts of the brain.[2] They did not know what to make of the psychical factor and could not understand it. They left it to the philosophers, the mystics and – the quacks; and they considered it unscientific to have anything to do with it. Accordingly they could find no approach to the secrets of the neuroses, and in particular of the enigmatic 'hysteria', which was, indeed, the prototype of the whole species. As late as in 1885, when I was studying at the Salpêtrière, I found

1 [It was actually published at the beginning of November, 1899. Cf. *RSE*, **4**, xvi.]

2 [What united these scientists was their contributions to the 'localizationist' school, which narrowly correlated neural structures and functions on the basis of brain lesion studies. In the neuroses, by definition, no structural lesion can be found. (See Solms & Saling, 1986, for a full discussion of Freud's attitude to localizationism.)]

that people were content to account for hysterical paralyses by a formula which asserted that they were founded on slight functional disturbances of the same parts of the brain which, when they were severely damaged, led to the corresponding organic paralyses.

[192] Of course, this lack of understanding affected the *treatment* of these pathological conditions badly as well. In general this consisted in measures designed to 'harden' the patient – in the prescription of medicines and in attempts, mostly very ill-contrived and executed in an unfriendly *Seele* manner, at bringing mental [*seelischen*][T] influences to bear on him by threats, jeers and warnings and by exhorting him to make up his mind [*Willen*] to 'pull himself together'. Electrical treatment was given out as being a specific cure for nervous conditions; but anyone who has endeavoured to carry out Erb's [1882] detailed instructions must marvel at the space that phantasy [*Phantasie*][T] can occupy even in what professes to be an exact science. The decisive turn was taken in the eighties, when the phenomena of hypnotism made one more attempt to find admission to medical science – this time with more success than so often before, thanks to the work of Liébeault, Bernheim, Heidenhain and Forel. The essential thing was that the genuineness of these phenomena was recognized. Once this had been admitted, two fundamental and unforgettable lessons could not fail to be drawn from hypnotism. First, one was given convincing proof that striking somatic changes could after all be brought about solely by mental influences, which in this case one had oneself set in motion. Secondly, one received the clearest impression – especially from the behaviour of subjects *after* hypnosis – of the existence of mental processes that one could only describe as 'unconscious'. The 'unconscious' had, it is true, long been under discussion among philosophers as a theoretical concept; but now for the first time, in the phenomena of hypnotism, it became something actual, tangible and subject to experiment. Apart from all this, hypnotic phenomena showed an unmistakable similarity to the manifestations of some neuroses.

It is not easy to overestimate the importance of the part played by hypnotism in the history of the origin of psychoanalysis. From a theoretical as well as from a therapeutic point of view, psychoanalysis has at its command a legacy which it has inherited from hypnotism.

Hypnosis also proved a valuable aid in the study of the neuroses – once again, first and foremost, of hysteria. Charcot's experiments created a great impression. He suspected that certain paralyses which appeared after a trauma (an accident) were of a hysterical nature, and

he showed that, by suggesting a trauma under hypnosis, he was able to provoke paralyses of the same sort artificially. The expectation was thus raised that traumatic influences might in all cases play a part in the [193] production of hysterical symptoms. Charcot himself made no further efforts towards a psychological understanding of hysteria; but his pupil, Pierre Janet, took up the question and was able to show, with the help of hypnosis, that the symptoms of hysteria were firmly dependent on certain unconscious thoughts (*idées fixes*). Janet attributed to hysteria a supposed constitutional incapacity for holding mental processes together – an incapacity which led to a disintegration (dissociation) of mental life.

Psychoanalysis, however, was not in any way based on these researches of Janet's. The decisive factor in its case was the experience of a Viennese physician, Dr Josef Breuer. In 1881, independently of any outside influence, he was able with the help of hypnosis to study and restore to health a highly gifted girl who suffered from hysteria.[1] Breuer's findings were not given to the public until fifteen years later, after he had taken the present writer (Freud) into collaboration. This case of Breuer's retains its unique significance for our understanding of the neuroses to this day; so that we cannot avoid dwelling on it a little longer. It is essential to realize clearly in what its peculiarity consisted. The girl had fallen ill while she was nursing her father, to whom she was tenderly attached. Breuer was able to establish that all her symptoms were related to this period of nursing and could be explained by it. Thus it had for the first time become possible to obtain a complete view of a case of this puzzling neurosis, and all its symptoms had turned out to have a meaning [*sinnvoll*]. Further, it was a universal feature of the symptoms that they had arisen in situations involving an impulse to an action which, however, had not been carried out but had for other reasons [*Motive*]^{T} been suppressed. The symptoms had, in fact, appeared *in place of* the actions that were not performed. Thus, to explain the aetiology of hysterical symptoms, we were led to the subject's emotional life (to affectivity) and to the interplay of mental forces [*Kräfte*]^{T} (to dynamics); and since then these two lines of approach have never been dropped.

The precipitating causes of the symptoms were compared by Breuer to Charcot's traumas. Now it was a remarkable fact that all these traumatic precipitating causes, and all the mental impulses starting from them, were lost to the patient's memory, as though they had never hap- [194] pened; while their products – the symptoms – persisted unaltered, as

1 [Cf. *RSE*, **2**, 19 ff.]

though, so far as they were concerned, there was no such thing as the effacing effect of time. Here, therefore, we had a fresh proof of the existence of mental processes which were unconscious but for that very reason especially powerful – processes which we had first come to know in post-hypnotic suggestion. The therapeutic procedure adopted by Breuer was to induce the patient, under hypnosis, to remember the forgotten traumas and to react to them with powerful expressions of affect. When this had been done, the symptom, which had till then taken the place of these expressions of emotion, disappeared. Thus one and the same procedure served simultaneously the purposes of investigating and of getting rid of the ailment; and this unusual conjunction was later retained in psychoanalysis.

After the present writer had, during the early nineties, confirmed Breuer's results in a considerable number of patients, the two, Breuer and Freud, together decided on a publication, *Studies on Hysteria* (1895*d*), which contained their findings and an attempt at a theory based on them. This asserted that hysterical symptoms arose when the affect
Besetzung of a mental process cathected [*besetzten*][T] with a strong affect was forcibly prevented from being worked over consciously in the normal way and was thus diverted into a wrong path. In cases of hysteria, according to this theory, the affect passed over into an unusual somatic innervation ('conversion'), but could be given another direction and got rid of ('abreacted'), if the experience were revived under hypnosis. The authors gave this procedure the name of 'catharsis' (purging, setting free of a strangulated affect).

The cathartic method was the immediate precursor to psychoanalysis; and, in spite of every extension of experience and of every modification of theory, is still contained within it as its nucleus. But it was no more than a new medical procedure for influencing certain nervous diseases, and nothing suggested that it might become a subject for the most general interest and for the most violent contradiction.

II

Soon after the publication of *Studies on Hysteria* the partnership
[195] between Breuer and Freud came to an end. Breuer, who was in reality a consultant in internal medicine, gave up treating nervous patients, and Freud devoted himself to the further perfection of the instrument left over to him by his elder collaborator. The technical novelties which he introduced and the discoveries which he made changed the cathartic

method into psychoanalysis. The most momentous step, no doubt, was his determination to do without the assistance of hypnosis in his technical procedure. He did so for two reasons: first, because, in spite of a course of instruction with Bernheim at Nancy, he did not succeed in inducing hypnosis in a sufficient number of cases, and secondly, because he was dissatisfied with the therapeutic results of catharsis based on hypnosis. It is true that these results were striking and appeared after a treatment of short duration, but they turned out not to be permanent and to depend too much on the patient's personal relations with the physician. The abandonment of hypnosis made a breach in the course of development of the procedure up to then, and it meant a fresh start.

Hypnosis had, however, performed the service of restoring to the patient's memory what he had forgotten. It was necessary to find some other technique to replace it; and the idea occurred to Freud of substituting for it the method of 'free association' [*freien Assoziation*][T]. That is to say, he pledged his patients to refrain from any conscious reflection and to abandon themselves, in a state of quiet concentration, to following the ideas [*Einfälle*] which occurred to them spontaneously (involuntarily) – 'to skim off the surface of their consciousness'.[1] They were to communicate these ideas to the physician even if they felt objections to doing so, if, for instance, the thoughts seemed too disagreeable, too senseless, too unimportant or irrelevant. The choice of free association as a means of investigating the forgotten unconscious material seems so strange that a word in justification of it will not be out of place. Freud was led to it by an expectation that the so-called 'free' association would prove in fact to be unfree, since, when all conscious intellectual purposes [*Denkabsichten*] had been suppressed, the ideas that emerged would be seen to be determined by the unconscious material. This expectation was justified by experience. When the 'fundamental rule of psychoanalysis' which has just been stated was [196] obeyed, the course of free association produced a plentiful store of ideas [*Einfällen*] which could put one on the track of what the patient had forgotten. To be sure, this material did not bring up what had actually been forgotten, but it brought up such plain and numerous hints at it that, with the help of a certain amount of supplementing and interpreting [*Deutungen*][T], the doctor was able to guess [*erraten*][T] (to reconstruct [*rekonstruieren*]) the forgotten material from it. Thus free

1 [The reason for the inverted commas is not clear. See, however, the similar phrase in Freud's contribution on 'Psychoanalysis' to Marcuse's encyclopaedia (1923*a*), *RSE*, **18**, 232.]

association together with the art of interpretation performed the same function as had previously been performed by hypnotism.

It looked as though our work had been made much more difficult and complicated; but the inestimable gain was that an insight was now obtained into an interplay of forces which had been concealed from the observer by the hypnotic state. It became evident that the work of uncovering what had been pathogenically forgotten had to struggle against a constant and very intense resistance. The critical objections which the patient raised in order to avoid communicating the ideas which occurred to him, and against which the fundamental rule of psychoanalysis was directed, had themselves already been manifestations of this resistance. A consideration of the phenomena of resistance led to one of the cornerstones of the psychoanalytic theory of the neuroses – the theory of repression [*Verdrängung*][T]. It was plausible to suppose that the same forces which were now struggling against the pathogenic material being made conscious had at an earlier time made the same efforts with success. A gap in the aetiology of neurotic symptoms was thus filled. The impressions and mental impulses, for which the symptoms were now serving as substitutes, had not been forgotten without reason [*grundlos*] or on account of a constitutional incapacity for synthesis (as Janet supposed); they had, through the influence of other mental forces, met with a repression the success and evidence of which was precisely their being debarred from consciousness and excluded from memory. It was only in consequence of this repression that they had become pathogenic – that is, had succeeded in manifesting themselves along unusual paths as symptoms.

A conflict between two groups of mental trends had to be looked on as the ground for repression and accordingly as the cause of every neurotic illness. And here experience taught us a new and surprising fact
[197] about the nature of the forces that were struggling against each other. Repression invariably proceeded from the sick person's conscious personality (his ego [*Ich*][T]) and took its stand on aesthetic and ethical motives [*Motive*][T]; the impulses [*Regungen*][T] that were subjected to repression were those of selfishness and cruelty, which can be summed up in general as evil, but above all sexual wishful impulses, often of the crudest and most forbidden kind. Thus the symptoms were a substitute for forbidden satisfactions and the illness seemed to correspond to an incomplete subjugation of the immoral side of human beings.

Advance in knowledge made ever clearer the enormous part played in mental life by sexual wishful impulses, and led to a detailed study of

the nature and development of the sexual drive [*Sexualtrieb*][T].[1] But we also came upon another purely empirical finding, in the discovery that the experiences and conflicts of the first years of childhood play an unsuspectedly important part in the individual's development and leave behind them ineffaceable dispositions bearing upon the period of maturity. This led to the revelation of something that had hitherto been fundamentally overlooked by science – infantile sexuality, which, from the tenderest age onwards, is manifested both in physical reactions and in mental attitudes. In order to bring together this sexuality of children with what is described as the normal sexuality of adults and the abnormal sexual life of perverts, the concept of what was sexual had itself to be corrected and widened in a manner which could be justified by the evolution of the sexual drive. *Trieb*

After hypnosis was replaced by the technique of free association, Breuer's cathartic procedure turned into psychoanalysis, which for more than a decade was developed by the author (Freud) alone. During that time psychoanalysis gradually acquired a theory which appeared to give a satisfactory account of the origin, meaning and purpose of neurotic symptoms and provided a rational basis for medical attempts at curing the complaint. I will once again enumerate the factors that go to make up this theory. They are: emphasis on the life of the drives (affectivity), on mental dynamics, on the fact that even the apparently most obscure and arbitrary mental phenomena invariably have a meaning and a causation, the theory of psychical conflict and of the pathogenic nature of repression, the view that symptoms are substitutive satisfactions, the recognition of the aetiological importance of sexual life, and [198] in particular of the beginnings of infantile sexuality. From a philosophical standpoint this theory was bound to adopt the view that the mental does not coincide with the conscious, that mental processes are in themselves unconscious and are only made conscious by the functioning of special organs (agencies or systems). By way of completing this list, I will add that among the affective attitudes of childhood the complicated emotional relation of children to their parents – what is known as the Oedipus complex – came into prominence. It became ever clearer that this was the nucleus of every case of neurosis, and in the patient's behaviour towards his analyst certain phenomena of his emotional transference [*Gefühlsübertragung*][T] emerged which came to be of great importance for theory and technique alike. *Übertragung*

In the form which it thus assumed, the psychoanalytic theory of the

1 Freud, *Three Essays on the Theory of Sexuality* (1905*d*).

neuroses already contained a number of things which ran counter to accepted opinions and inclinations and which were calculated to provoke astonishment, repugnance and scepticism in outsiders; for instance, the attitude of psychoanalysis to the problem of the unconscious, its recognition of an infantile sexuality and the stress it laid on the sexual factor in mental life generally. But more was to follow.

III

In order to reach even halfway to an understanding of how, in a hysterical girl, a forbidden sexual wish can change into a painful symptom, it had been necessary to make far-reaching and complicated hypotheses about the structure and functioning of the mental apparatus. There was an evident contradiction here between expenditure of effort and result. If the conditions postulated by psychoanalysis really existed, they were of a fundamental nature and must be able to find expression in other phenomena besides hysterical ones. But if this inference were correct, psychoanalysis would have ceased to be of interest only to neurologists; it could claim the attention of everyone to whom psychological research was of any importance. Its findings would not only have to be taken into account in the field of pathological mental life but could not be overlooked either in coming to an understanding of normal functioning.

[199] Evidence of its being of use for throwing light on other than pathological mental activity was early forthcoming in connection with two kinds of phenomena: with the very frequent parapraxes that occur in everyday life – such as forgetting things, slips of the tongue and mislaying objects [*Vergessen, Versprechen, Verlegen*] – and with the dreams dreamt by healthy and psychically normal people. Small failures of functioning [*Fehlleistungen*][T], like the temporary forgetting of normally familiar proper names, slips of the tongue and of the pen [*Verschreiben*], and so on, had hitherto not been considered worthy of any explanation at all or were supposed to be accounted for by conditions of fatigue, by distraction of the attention, etc. The present writer then showed from many examples, in his book *The Psychopathology of Everyday Life* (1901*b*), that events of this kind have a meaning, and arise owing to a conscious intention being interfered with by another, suppressed or actually unconscious one. As a rule, quick reflection or a short analysis is enough to reveal the interfering influence. Owing to the frequency of such parapraxes [*Fehlleistungen*] as slips of the tongue, it became easy for anyone to convince himself from his own experience of the

existence of mental processes which are not conscious, but which are nevertheless operative and which at least find expression as inhibitions [*Hemmungen*][T] and modifications of other, intended acts.

The analysis of dreams led further: it was brought to public notice by the present writer as early as in 1900 in *The Interpretation of Dreams*. This showed that dreams are constructed in just the same way as neurotic symptoms. Like them, they may appear strange and senseless; but, if we examine them by a technique which differs little from the free association used in psychoanalysis, we are led from their manifest content to a secret meaning, to the latent dream thoughts. This latent meaning is always a wishful impulse which is represented as fulfilled at the moment of the dream. But, except in young children and under the pressure of imperative physical needs, this secret wish can never be expressed recognizably. It has first to submit to a distortion, which is the work of restrictive, censoring forces in the dreamer's ego. In this way the manifest dream, as it is remembered in waking life, comes about. It is distorted, to the pitch of being unrecognizable, by concessions made to the dream censorship; but it can be revealed once more by analysis as an expression of a situation of satisfaction or as the fulfilment of a wish. It is a compromise between two conflicting groups of mental [200]
trends, just as we have found to be the case with hysterical symptoms. The formula which, at bottom, best meets the essence of the dream is this: a dream is a (disguised) fulfilment of a (repressed) wish. The study of the process which transforms the latent dream wish into the manifest content of the dream – a process known as the 'dream-work' – has taught us the best part of what we know of unconscious mental life.

Now a dream is not a morbid symptom but a product of the normal mind. The wishes which it represents as fulfilled are the same as those which are repressed in neuroses. Dreams owe the possibility of their genesis merely to the favourable circumstance that during the state of sleep, which paralyses man's power of movement, repression is mitigated into the dream censorship. If, however, the process of dream formation oversteps certain limits, the dreamer brings it to a stop and wakes up in a fright [*erschreckt*]. Thus it is proved that the same forces and the same processes taking place between them operate in normal as in pathological mental life. From the date of *The Interpretation of Dreams* psychoanalysis had a twofold significance. It was not only a new method of treating the neuroses but it was also a new psychology; it claimed the attention not only of nerve specialists but also of all those who were students of a human science [*Geisteswissenschaft*].

The reception given it in the scientific world was, however, no friendly one. For some ten years no-one took any notice of Freud's works. About the year 1907 attention was drawn to psychoanalysis by a group of Swiss psychiatrists (Bleuler and Jung, in Zürich), and a storm of indignation, which was not precisely fastidious in its methods and arguments, thereupon broke out, particularly in Germany. In this, psychoanalysis was sharing the fate of many novelties which, after a certain lapse of time, have found general recognition. Nevertheless it lay in its nature that it should inevitably arouse particularly violent opposition. It wounded the prejudices of civilized humanity at some specially sensitive spots. It subjected every individual, as it were, to the analytic reaction, by uncovering what had by universal agreement been repressed into the unconscious; and in this way it forced its contemporaries to behave like patients who, under analytic treatment, above all else bring their resistances to the fore. It must also be admitted that it was no easy thing to become convinced of the correctness of the psychoanalytic theories, nor to obtain instruction in the practice of analysis. [201]

The general hostility, however, did not succeed in preventing psychoanalysis from continuous expansion during the next decade in two directions: on the map, for interest in it was constantly cropping up in new countries, and in the field of the human sciences, for it was constantly finding applications in new branches of knowledge. In 1909 President G. Stanley Hall invited Freud and Jung to give a series of lectures at Clark University in Worcester, Mass., of which he was the head and where they were given a friendly reception. Since then psychoanalysis has remained popular in America, although precisely in that country its name has been coupled with much superficiality and some abuses. As early as in 1911, Havelock Ellis was able to report that analysis was studied and practised, not only in Austria and Switzerland, but also in the United States, in England, India, Canada, and, no doubt, in Australia too.

It was in this period of struggle and of first blossoming, moreover, that the periodicals devoted exclusively to psychoanalysis were inaugurated. These were the *Jahrbuch für psychoanalytische und psychopathologische Forschungen* [*Yearbook for Psychoanalytic and Psychopathological Researches*] (1909–14), directed by Bleuler and Freud and edited by Jung, which ceased publication at the outbreak of the World War, the *Zentralblatt für Psychoanalyse* [*Central Journal for Psychoanalysis*] (1911), edited by Adler and Stekel, which was soon replaced by the *Internationale Zeitschrift für Psychoanalyse*

[*International Journal for Psychoanalysis*] (1913, today in its tenth volume); further, since 1912, *Imago*, founded by Rank and Sachs, a periodical for the application of psychoanalysis to the human sciences. The great interest taken in the subject by Anglo-American doctors was shown in 1913 by the founding of the still active *Psychoanalytic Review* by White and Jelliffe. Later, in 1920, *The International Journal of Psycho-Analysis*, intended specially for readers in England, made its appearance under the editorship of Ernest Jones. The Internationaler Psychoanalytischer Verlag and the corresponding English undertaking, The International Psycho-Analytical Press, brought out a continuous series of analytic publications under the name of the Internationale Psychoanalytische Bibliothek (International Psycho-Analytical Library). The literature of psychoanalysis is, of course, not to be found only in [202]
these periodicals, which are for the most part supported by psychoanalytic societies; it appears far and wide in a great number of places, in scientific and in literary publications. Among the periodicals of the Latin world which pay special attention to psychoanalysis the *Revista de Psiquiatría*, edited by H. Delgado in Lima (Peru), may be specially mentioned.

An essential difference between this second decade of psychoanalysis and the first lay in the fact that the present writer was no longer its sole representative. A constantly growing circle of pupils and followers had collected around him, who devoted themselves first to the diffusion of the theories of psychoanalysis and then extended them, supplemented them and carried them deeper. In the course of years, several of these supporters, as was inevitable, seceded, took their own paths, or turned themselves into an opposition which seemed to threaten the continuity of the development of psychoanalysis. Between 1911 and 1913 C. G. Jung in Zürich and Alfred Adler in Vienna produced some stir by their attempts at giving new interpretations to the facts of analysis and their efforts at a diversion from the analytic standpoint. But it soon appeared that these secessions had effected no lasting damage. What temporary success they achieved was easily accounted for by the readiness of the mass of people to have themselves set free from the pressure of the demands of psychoanalysis by whatever path might be opened to them. The great majority of co-workers remained firm and continued their work along the lines indicated to them. We shall come on their names repeatedly in the short account below of the findings of psychoanalysis in the many and various fields of its application.

IV

The noisy rejection of psychoanalysis by the medical world could not deter its supporters from developing it, to begin with, along its original lines into a specialized pathology and treatment of the neuroses – a task which has not been completely accomplished even today. Its undeniable therapeutic success, which far exceeded any that had previously been achieved, constantly spurred them on to fresh efforts; while the difficulties which came to light as the material was examined more deeply led
[203] to profound alterations in the technique of analysis and to important corrections in its theoretical hypotheses and postulates.

In the course of this development, the technique of psychoanalysis has become as definite and as delicate as that of any other specialized branch of medicine. A failure to understand this fact has led to many abuses (particularly in England and America) because people who have acquired only a literary knowledge of psychoanalysis from reading consider themselves capable of undertaking analytic treatments without having received any special training. The consequences of such behaviour are damaging both to the science and to the patients and have brought much discredit upon psychoanalysis. The foundation of a first psychoanalytic out-patient clinic (by Max Eitingon in Berlin in 1920) has therefore become a step of high practical importance. This institute seeks on the one hand to make analytic treatment accessible to wide circles of the population and on the other hand undertakes the education of doctors to be practical analysts by a course of training which includes as a condition that the learner shall agree to be analysed himself.

Among the hypothetical concepts which enable the doctor to deal with the analytic material, the first to be mentioned is that of 'libido'. Libido means in psychoanalysis in the first instance the force (thought of as quantitatively variable and measurable) of the sexual drives directed towards an object – 'sexual' in the extended sense required by analytic theory. Further study showed that it was necessary to set alongside this 'object libido' a 'narcissistic' or 'ego libido', directed to the subject's own ego; and the interaction of these two forces has enabled us to account for a great number of normal and abnormal processes in mental life. A rough distinction was soon made between what are known as the 'transference neuroses' and the narcissistic disorders. The former (hysteria and obsessional neurosis) are the objects proper of psychoanalytic treatment, while the others, the narcissistic neuroses, though

they can, it is true, be examined by the help of analysis, offer fundamental difficulties to therapeutic influence. It is true that the libido theory of psychoanalysis is by no means complete and that its relation to a general theory of the drives is not yet clear, for psychoanalysis is a young science, quite unfinished and in a stage of rapid development. Here, however, it should be emphatically pointed out how erroneous [204]
the charge of pan-sexualism is which is so often levelled at psychoanalysis. It seeks to show that psychoanalytic theory knows of no mental driving forces [*Triebkräfte*] other than purely sexual ones and in doing so exploits popular prejudices by using the word 'sexual' not in its analytic but in its vulgar sense.

The psychoanalytic view would also have to include in narcissistic disorders all the ailments described in psychiatry as 'functional psychoses'. It could not be doubted that neuroses and psychoses are not separated by a hard and fast line, any more than health and neurosis; and it was plausible to explain the mysterious psychotic phenomena by the discoveries achieved on the neuroses, which had hitherto been equally incomprehensible. The present writer had himself, during the period of his isolation, made a case of paranoid illness partly intelligible by an analytic investigation and had pointed out in this unquestionable psychosis the same contents (complexes) and a similar interplay of forces as in the simple neuroses.[1] Bleuler [1906*b*] followed the indications of what he called 'Freudian mechanisms' in a whole number of psychoses, and Jung won high opinions as an analyst at a single blow when, in 1907,[2] he explained the most eccentric symptoms in the end stages of dementia praecox from the individual life histories of the patients. The comprehensive study of schizophrenia by Bleuler (1911) probably demonstrated once and for all the justification of a psychoanalytic angle of approach for the understanding of these psychoses.

In this way psychiatry became the first field to which psychoanalysis was applied and it has remained so ever since. The same research workers who have done most to deepen analytic knowledge of the neuroses, such as Karl Abraham in Berlin and Sándor Ferenczi in Budapest (to name only the most prominent), have also played a leading part in throwing analytic light on the psychoses. The conviction of the unity and intimate connection of all the disorders that present themselves as neurotic and psychotic phenomena is becoming more and more firmly

1 [See Section III of Freud's second paper on the neuropsychoses of defence (1896*b*), *RSE*, **3**, 183 ff.]

2 [This is misprinted '1901' in both the German editions.]

established despite all the efforts of the psychiatrists. People are begin-
[205] ning to understand – best of all, perhaps, in America – that the psychoanalytic study of the neuroses is the only preparation for an understanding of the psychoses, and that psychoanalysis is destined to make possible a scientific psychiatry of the future which will not need to content itself with describing curious clinical pictures and unintelligible sequences of events and with tracing the influence of gross anatomical and toxic traumas upon a mental apparatus which is inaccessible to our knowledge.

V

But the importance of psychoanalysis for psychiatry would never have drawn the attention of the intellectual world to it or won it a place in *The History of Our Times*.[1] This result was brought about by the relation of psychoanalysis to normal, not to pathological, mental life. Originally, analytic research had indeed no other aim than to establish the determinants of the onset (the genesis) of a few morbid mental states. In the course of its efforts, however, it succeeded in bringing to light facts of fundamental importance, in actually creating a new psychology, so that it became obvious that the validity of such findings could not possibly be restricted to the sphere of pathology. We have seen already when it was that the decisive proof was produced of the correctness of this conclusion. It was when dreams were successfully interpreted by analytic technique – dreams, which are a part of the mental life of normal people and which yet may in fact be regarded as pathological products that can regularly appear under healthy conditions.

If the psychological discoveries gained from the study of dreams were firmly kept in view, only one further step was needed before psychoanalysis could be proclaimed as the theory of the deeper mental processes not directly accessible to consciousness – as a 'depth psychology' – and before it could be applied to almost all the human sciences. This step lay in the transition from the mental activity of individual men to the psychical functions of human communities and peoples – that is,
Masse from individual to group psychology [*Massenpsychologie*][T]; and many surprising analogies forced this transition upon us. It had been found, for instance, that in the deep strata of unconscious mental activity
[206] contraries are not distinguished from each other but are expressed by

1 [In English in the original – a probable allusion to the title of the publication for which this paper was written.]

the same element. But already in 1884 Karl Abel the philologist had put forward the view (in his 'Über den Gegensinn der Urworte'[1]) that the oldest languages known to us treat contraries in the same way. Thus ancient Egyptian, for example, had in the first instance only one word for 'strong' and 'weak', and not till later were the two sides of the antithesis distinguished by slight modifications. Even in the most modern languages clear relics of such antithetical meanings are to be found. So in German '*Boden*' ['garret' or 'ground'] means the highest as well as the lowest thing in the house; similarly in Latin '*altus*' means 'high' and 'deep'. Thus the equivalence of contraries in dreams is a universal archaic trait in human thinking.

To take an instance from another field. It is impossible to escape the impression of the perfect correspondence which can be discovered between the obsessive actions of certain obsessional patients and the religious observances of believers all over the world.[2] Some cases of obsessional neurosis actually behave like a caricature of a private religion, so that it is tempting to liken the official religions to an obsessional neurosis that has been mitigated by becoming universalized. This comparison, which is no doubt highly objectionable to all believers, has nevertheless proved most fruitful psychologically. For psychoanalysis soon discovered in the case of obsessional neurosis what the forces are that struggle with one another in it till their conflicts find a remarkable expression in the ceremonial of obsessive actions. Nothing similar was suspected in the case of religious ceremonial until, by tracing back religious feeling to the relation with the father as its deepest root, it became possible to point to an analogous dynamic situation in that case too.[3] This instance, moreover, may warn the reader that even in its application to non-medical fields psychoanalysis cannot avoid wounding cherished prejudices, touching upon deeply rooted sensibilities and thus provoking enmities which have an essentially emotional basis.

If we may assume that the most general features of unconscious mental life (conflicts between drive impulses, repressions and substitutive satisfactions) are present everywhere, and if there is a depth psychology which leads to a knowledge of those features, then we may reasonably [207] expect that the application of psychoanalysis to the most varied spheres of human mental activity will everywhere bring to light important and hitherto unattainable results. In an exceedingly valuable study, Otto

1 ['The Antithetical Meaning of Primal Words.' Cf. Freud, 1910*e*; *RSE*, **11**.]

2 [Cf. Freud, 'Obsessive Actions and Religious Practices' (1907*b*), ibid., **9**.]

3 [Cf. *Totem and Taboo* (1912–13*a*), ibid., **13**.]

Rank and Hanns Sachs (1913) have tried to bring together what the work of psychoanalysts had been able to achieve up to that time towards fulfilling these expectations. Lack of space prevents me from attempting to complete their enumeration here. I can only select for mention the most important findings with the addition of a few details.

If we leave little-known internal urges [*Antrieben*] out of account, we may say that the main motive force [*Hauptmotor*] towards the cultural development [*Kulturentwicklung*][T] of man has been real external exigency, which has withheld from him the easy satisfaction of his natural needs and exposed him to immense dangers. This external frustration [*Versagung*][T] drove him into a struggle with reality, which ended partly in adaptation to it and partly in control over it; but it also drove him into working and living in common with those of his kind, and this already involved a renunciation of a number of drive impulses which could not be satisfied socially. With the further advances of civilization [*Kultur*] the demands of repression also grew. Civilization is after all built entirely on renunciation of drive, and every individual on his journey from childhood to maturity has in his own person to recapitulate this development of humanity to a state of judicious resignation. Psychoanalysis has shown that it is predominantly, though not exclusively, sexual drive impulses that have succumbed to this cultural suppression. One portion of them, however, exhibit the valuable characteristic of allowing themselves to be diverted from their immediate aims and of thus placing their energy at the disposal of cultural development in the form of 'sublimated' trends. But another portion persist in the unconscious as unsatisfied wishes and press for some, even if it is distorted, satisfaction.

Kultur

We have seen that one part of human mental activity is directed towards obtaining control over the real external world. Psychoanalysis now tells us further that another, particularly highly prized, part of creative mental work serves for the fulfilment of wishes – for the substitutive satisfaction of the repressed wishes which, from the days of childhood, live in the spirit [*Seele*] of each of us, unsatisfied. Among these creations, whose connection with an incomprehensible unconscious was always suspected, are myths and works of imaginative writing and of art, and the researches of psychoanalysts have in fact thrown a flood of light on the fields of mythology, the science of literature and the psychology of artists. It is enough to mention Otto Rank's work as an example. We have shown that myths and fairy tales can be interpreted like dreams, we have traced the convoluted paths that lead from

[208]

the urge of the unconscious wish to its realization in a work of art, we have learnt to understand the emotional effect of a work of art on the observer, and in the case of the artist himself we have made clear his internal kinship with the neurotic as well as his distinction from him, and we have pointed out the connection between his innate disposition, his chance experiences and his achievements. The aesthetic appreciation of works of art and the elucidation of the artistic gift are, it is true, not among the tasks set to psychoanalysis. But it seems that psychoanalysis is in a position to speak the decisive word in all questions that touch upon the imaginative life [*Phantasieleben*] of man.

And now, as a third point, psychoanalysis has shown us, to our growing astonishment, the enormously important part played by what is known as the 'Oedipus complex' – that is, the emotional relation of a child to its two parents – in the mental life of human beings. Our astonishment diminishes when we realize that the Oedipus complex is the psychical correlate of two fundamental biological facts: the long period of the human child's dependence, and the remarkable way in which its sexual life reaches a first climax in the third to fifth years of life, and then, after a period of inhibition, sets in again at puberty. And here, the discovery was made that a third and extremely serious part of human intellectual activity [*Geistestätigkeit*], the part which has created the great institutions of religion, law, ethics, and all forms of civic life, has as its fundamental aim the enabling of the individual to master his Oedipus complex and to divert his libido from its infantile attachments into the social ones that are ultimately desired. The applications of psychoanalysis to the science of religion and sociology (e.g. by the present writer, Theodor Reik and Oskar Pfister), which have led to these findings, are still young and insufficiently appreciated; but it cannot be doubted that further studies will only confirm the certainty of these important conclusions.

By way, as it were, of postscript, I must also mention that educationists, too, cannot avoid making use of the hints which they have received from the analytic exploration of the mental life of children; and further that voices have been raised among therapists (e.g. Groddeck and Jelliffe), maintaining that the psychoanalytic treatment of serious organic complaints shows promising results, since in many of these affections some part is played by a psychical factor on which it is possible to bring influence to bear. [209]

Thus we may express our expectation that psychoanalysis, whose development and achievements hitherto have been briefly and

inadequately related in these pages, will enter into the cultural development of the next decades as a significant ferment, and will help to deepen our understanding of the world and to fight against some things in life which are recognized as injurious. It must not be forgotten, however, that psychoanalysis alone cannot offer a complete picture of the world. If we accept the distinction which I have recently proposed of dividing the mental apparatus into an ego, turned towards the external world and equipped with consciousness, and an unconscious id [*Es*][T], dominated by its drive needs, then psychoanalysis is to be described as a psychology of the id (and of its effects upon the ego). In each field of knowledge, therefore, it can make only *contributions*, which need to be completed from the psychology of the ego.[1] If these contributions often contain the essence of the facts, this only corresponds to the important part which, it may be claimed, is played in our lives by the mental unconscious that has so long remained unknown.

1 [Freud seems, in this passage, to be imposing significant restrictions on the scope of psychoanalysis.]

THE RESISTANCES TO PSYCHOANALYSIS

The present translation is a slightly revised and corrected reprint of the *SE* version.

Freud's name was on the 'Editorial Committee' of the periodical in which this essay first appeared in French. It was written at the request of the actual editor, Albert Cohen, probably in September, 1924. The German original appeared almost simultaneously in *Imago* and in the *Almanach 1926*, which was published in September, 1925 – some six months after the French issue.

THE RESISTANCES TO PSYCHOANALYSIS

A child in his nurse's arms will turn away screaming at the sight of a strange face; a pious man will begin the new season with a prayer and he will also greet the first fruits of the year with a blessing; a peasant will refuse to buy a scythe unless it bears the trademark that was familiar to his parents. The distinction between these situations is obvious and would seem to justify one in looking for a different motive [*Motiv*][T] in each of them. [213]

Nevertheless, it would be a mistake to overlook what they have in common. In each case we are dealing with unpleasure [*Unlust*][T] of the same kind. The child expresses it in an elementary fashion, the pious man lulls it by an artifice, while the peasant uses it as the motive for a decision. The source of this unpleasure is the demand made upon the mind [*Seelenleben*][T] by anything that is *new*, the psychical expenditure that it requires, the uncertainty, mounting up to anxious expectancy, which it brings along with it. It would be interesting to devote a whole study to mental reactions to novelty; for under certain, no longer primary, conditions we can observe behaviour of the contrary kind – a thirst for stimulation which flings itself upon anything that is new merely because it *is* new. *Seele*

In scientific affairs there should be no place for recoiling from novelty. Science, in her perpetual incompleteness and insufficiency, is driven to hope for her salvation in new discoveries and new ways of regarding things [*Auffassungen*][T]. She does well, in order not to be deceived, to arm herself with scepticism and to accept nothing new unless it has withstood the strictest examination. Sometimes, however, this scepticism shows two unexpected features; it may be sharply directed against what is new while it spares what is familiar and accepted, and it may be content to reject things before it has examined them. But in behaving thus it reveals itself as a prolongation of the primitive reaction against what is new and as a cloak for the retention of that reaction. It is a matter of common knowledge how often in the history of scientific

research it has happened that innovations have met with intense and stubborn resistance, while subsequent events have shown that the resistance was unjustified and that the novelty was valuable and important.
[214] What provoked the resistance was, as a rule, certain factors in the subject matter of the novelty, while, on the other side, several factors must have combined to make the irruption of the primitive reaction possible.

A particularly bad reception was accorded to psychoanalysis, which the present writer began to develop nearly thirty years ago from the discoveries of Josef Breuer (of Vienna) on the origin of neurotic symptoms. It cannot be disputed that it possessed the quality of novelty, even though it made use of plenty of material which was well known from other sources (quite apart from Breuer's discoveries), such as the lessons from the teachings of Charcot, the great neuropathologist, and impressions derived from the sphere of hypnotic phenomena. Its original significance was purely therapeutic: it aimed at creating a new and efficient method for treating neurotic illnesses. But connections which could not be foreseen in the beginning caused psychoanalysis to reach out far beyond its original aim. It ended by claiming to have set our whole view of mental life upon a new basis and therefore to be of importance for every field of knowledge that is founded on psychology. After a decade of complete neglect it suddenly became a subject of general interest – and set loose a storm of indignant opposition.

The *forms* in which the resistance to psychoanalysis found expression need not now be considered. It is enough to say that the struggle over this innovation is by no means at an end, though it is already possible to see what direction it will take. Its opponents have not succeeded in suppressing the movement. Psychoanalysis, of which twenty years ago I was the only spokesman, has since attracted the support of numerous valuable and active workers, medical and non-medical, who make use of it as a procedure for the treatment of nervous diseases, as a method of psychological research and as an auxiliary instrument for scientific work in the most various departments of intellectual life. In the following pages our interest will be directed only to the *motives* of the resistance to psychoanalysis, with particular stress upon the composite character of that resistance and upon the differing amount of weight carried by its components.

From a clinical standpoint the neuroses must necessarily be put alongside the intoxications and such disorders as Graves' disease. These are
[215] conditions arising from an excess or a relative lack of certain highly active substances, whether produced inside the body or introduced into

it from outside – in short, they are disturbances of the chemistry of the body, toxic conditions. If someone succeeded in isolating and demonstrating the hypothetical substance or substances concerned in neuroses, he would have no need to worry about opposition from the medical profession. For the present, however, no such avenue of approach to the problem is open. At the moment we can only start from the symptoms presented by a neurosis – symptoms which in the case of hysteria, for instance, consist of a combination of somatic and mental disturbances. Now Charcot's experiments as well as Breuer's clinical observations taught us that the somatic symptoms of hysteria are psychogenic too – that is, that they are precipitates of mental processes that have run their course. By putting a subject into a state of hypnosis it was possible at will to produce the somatic symptoms of hysteria artificially.

Psychoanalysis took hold of this new realization and began to consider the problem of the nature of the psychical processes which led to these unusual consequences. But the direction taken by this enquiry was not to the liking of the contemporary generation of physicians. They had been brought up to respect only anatomical, physical and chemical factors. They were not prepared for taking psychical ones into account and therefore met them with indifference or antipathy. They obviously had doubts whether psychical events allowed of any exact scientific treatment whatever. As an excessive reaction against an earlier phase during which medicine had been dominated by what was known as the 'philosophy of Nature',[1] they regarded such abstractions as those with which psychology is obliged to work as nebulous, fantastic and mystical; while they simply refused [*versagten*][T] to believe in remarkable phenomena which might have been the starting point of research. The symptoms of hysterical neuroses were looked upon as shamming and the phenomena of hypnotism as a hoax. Even the psychiatrists, upon whose attention the most unusual and astonishing mental phenomena were constantly being forced, showed no inclination to examine their details or enquire into their connections. They were content to classify the variegated array of symptoms and trace them back, so far as they could manage, to somatic, anatomical or chemical aetiological disturbances. During this materialistic or, rather, mechanistic period, medicine made tremendous advances, but it also showed a short-sighted

Versagung

[216]

1 [A pantheistic attitude, chiefly associated with the name of Schelling, which was very prevalent in Germany during the first part of the nineteenth century.]

misunderstanding of the most important and most difficult among the problems of life.

It is easy to understand why doctors, with an attitude of this kind towards the mind, should have had no liking for psychoanalysis and should have demurred to its demand for learning many things afresh and for seeing many things in a different light. But as a compensation it might be supposed that the new theory would be all the more likely to meet with applause from philosophers. For philosophers were accustomed to putting abstract concepts (or, as unkind tongues would say, hazy words) at the forefront of their explanations of the universe, and it would be impossible that they should object to the extension of the sphere of psychology for which psychoanalysis had paved the way. But here another obstacle arose. The philosophers' idea of what is mental was not that of psychoanalysis. The overwhelming majority of philosophers regard as mental only the phenomena of consciousness. For them the world of consciousness coincides with the sphere of what is mental. Everything else that may take place in the 'mind' – an entity so hard to grasp – is relegated by them to the organic determinants of mental processes or to processes parallel to mental ones. Or, more strictly speaking, the mind has no contents other than the phenomena of consciousness, and consequently psychology, the science of the mind, has no other subject matter. And on this point the layman's view is the same.

What, then, can a philosopher say to a theory which, like psychoanalysis, asserts that on the contrary what is mental is in itself *unconscious* and that being conscious is only a *quality*, which may or may not accrue to a particular mental act and the withholding of which may perhaps alter that act in no other respect? He will naturally say that anything both unconscious and mental would be an impossibility, a *contradictio in adjecto*,[1] and he will fail to observe that in making this judgement he is merely repeating his own definition of what is mental,
[217] a definition which may perhaps be too narrow. It is easy for philosophers to feel this certainty, since they have no acquaintance with the material whose investigation has compelled analysts to believe in unconscious mental acts. Philosophers have never taken account of hypnosis, they have not concerned themselves with the interpreting [*Deutung*][T] of dreams – on the contrary, like doctors, they regard dreams as the meaningless products of reduced mental activity during sleep – they are scarcely aware that there are such things as obsessions [*Zwangsvorstellungen*][T] and delusions and they would find themselves in a most

1 ['A contradiction in terms.']

embarrassing situation if they were asked to explain them on the basis of their own psychological premises. Analysts, too, refuse to say what the unconscious is, but they can indicate the domain of phenomena whose observation has obliged them to assume its existence. Philosophers, who know no kind of observation other than self-observation, cannot follow them into that domain.

So it comes about that psychoanalysis derives nothing but disadvantages from its middle position between medicine and philosophy. Doctors regard it as a speculative system and refuse to believe that, like every other natural science, it is based on a patient and tireless elaboration of facts from the world of perception; philosophers, measuring it by the standard of their own artificially constructed systems, find that it starts from impossible premises and reproach it because its most general concepts (which are only now in process of evolution) lack clarity and precision.

This state of affairs is enough to account for the reluctant and hesitant reception of analysis in scientific quarters. But it does not explain the outbursts of indignation, derision and scorn which, in disregard of every standard of logic and good taste, have characterized the controversial methods of its opponents. A reaction of such a kind suggests that resistances other than purely intellectual ones were stirred up and that powerful emotional forces [*Mächte*]^{T} were aroused. And there are indeed plenty of things to be found in the theory of psychoanalysis calculated to produce such an effect as this upon the passions of men of every kind and not of scientists alone [*die Leidenschaften der Menschen, nicht der Wissenschaftler allein*]^{t}. Above all there is the very important place in the mental life of human beings which psychoanalysis assigns to what are known as the sexual drives [*Sexualtrieben*]^{T}. Psychoanalytic theory maintained that the symptoms of neuroses are distorted substitutive satisfactions of sexual drive forces, the direct satisfaction of which has been frustrated [*versagt*] by internal resistances. Later on, when analysis had extended beyond its original field of work and began to be applied to normal mental life, it sought to show that these same sexual components, which could be diverted from their immediate aims and directed to other things, made the most important contributions to the cultural [*kulturellen*]^{T} achievements of the individual and of society. These views were not entirely new. The incomparable significance of sexual life had been proclaimed by the philosopher Schopenhauer in an intensely impressive passage.[1] Moreover, what psychoanalysis called

Trieb [218] *Kultur*

1 [See the Appendix, p. 220 f. below.]

sexuality was by no means identical to the impulsion towards a union of the two sexes or towards producing a pleasurable sensation in the genitals; it had far more resemblance to the all-inclusive and all-preserving Eros of Plato's *Symposium*.[t]

But the opponents of psychoanalysis forgot its illustrious forerunners; they fell upon it as though it had made an assault upon the dignity of the human race. They accused it of 'pan-sexualism', though the psychoanalytic theory of the drives had always been strictly dualistic[1] and had at no time failed to recognize, alongside the sexual drives, others to which it actually ascribed force [*Kraft*][T] enough to suppress the sexual drives. (These mutually opposing forces were described to begin with as the sexual drives and the ego drives. A later theoretical development changed them into Eros and the drive to death or destruction.) The suggestion that art, religion and social order originated in part in a contribution from the sexual drives was represented by the opponents of analysis as a degradation of the highest cultural values [*Kulturgüter*]. They emphatically declared that men have other interests besides this eternal one of sex, overlooking in their zeal the fact that animals too have other interests – indeed they are subject to sexuality, not permanently like men, but only in bouts occurring at specific periods – overlooking, too, the fact that the existence of these other interests in men had never been disputed and that nothing can be altered in the value of a cultural achievement by its being shown to have been derived from elementary animal drive sources.

[219] Such a display of unfairness and lack of logic cries out for an explanation. Its origin is not hard to find. Human civilization [*Kultur*] rests upon two pillars, of which one is the control of natural forces and the other the restriction of our drives. The ruler's throne rests upon fettered slaves. Among the drive components which are thus brought into service, the sexual drives, in the narrower sense of the word, are conspicuous for their strength and savagery. Woe, if they should be set loose! The throne would be overturned and the ruler trampled under foot. Society is aware of this – and will not allow the topic to be mentioned.

But why not? What harm could the discussion do? Psychoanalysis has never said a word in favour of unfettering drives that would injure our community; on the contrary it has issued a warning and an exhortation to us to mend our ways. But society refuses to consent to the ventilation

1 [Cf. an Editors' footnote near the end of Chapter IV of *The Ego and the Id* (1923*b*), p. 41 *n*. 2 above.]

of the question, because it has a bad conscience in more than one respect. In the first place it has set up a high ideal of morality – morality being restriction of the drives – and insists that all its members shall fulfil that ideal without troubling itself with the possibility that obedience may bear heavily upon the individual. Nor is it sufficiently wealthy or well organized to be able to compensate the individual for the amount of his drive renunciation. It is consequently left to the individual to decide how he can obtain, for the sacrifice he has made, enough compensation to enable him to preserve his mental balance. On the whole, however, he is obliged to live psychologically beyond his means, while the unsatisfied claims of his drives make him feel the demands of civilization [*Kulturanforderungen*] as a constant pressure upon him. Thus society maintains a condition of *cultural hypocrisy* which is bound to be accompanied by a sense of insecurity and a necessity for guarding what is an undeniably precarious situation by forbidding criticism and discussion. This line of thought holds good for all the drive impulses [*Triebregungen*][T], including, therefore, the egoistic ones. The question whether it applies to all possible forms of civilization, and not merely to those which have evolved hitherto, cannot be discussed here. As regards the sexual drives in the narrower sense, there is the further point that in most people they are tamed insufficiently and in a manner which is psychologically wrong and are therefore readier than the rest to break loose. *Regung*

Psychoanalysis has revealed the weaknesses of this system and has recommended that it should be altered. It proposes that there should be a reduction in the strictness with which drives are repressed [*Triebverdrängung*][T] and that correspondingly more play should be given to truthfulness. Certain drive impulses, with whose suppression society has gone too far, should be permitted a greater amount of satisfaction; in the case of certain others the inefficient method of suppressing them by means of repression should be replaced by a better and securer procedure. As a result of these criticisms psychoanalysis is regarded as 'inimical to culture' and has been put under a ban as a 'social danger'. This resistance cannot last for ever. No human institution can in the long run escape the influence of fair criticism; but men's attitude to psychoanalysis is still dominated by this fear [*Angst*][T], which gives rein to their passions and diminishes their power of logical argument. [220] *Verdrängung*

By its theory of the drives psychoanalysis offended the feelings of individuals insofar as they regarded themselves as members of the social community; another branch of its theory was calculated to hurt

every single person at the tenderest point of his own psychical development. Psychoanalysis disposed once and for all of the fairy tale of an asexual childhood. It demonstrated the fact that sexual interests and activities occur in small children from the beginning of their lives. It showed what transformations those activities pass through, how at about the age of five they succumb to inhibition [*Hemmung*][T] and how from puberty onwards they enter the service of the reproductive function. It recognized that early infantile sexual life reaches its peak in what is known as the Oedipus complex (an emotional attachment of the child to the parent of the opposite sex accompanied by an attitude of rivalry to the parent of the same sex) and that at that period of life this impulsion extends uninhibited into a straightforward sexual desire. This can be confirmed so easily that only the greatest efforts could make it possible to overlook it. Every individual has in fact gone through this phase but has afterwards energetically repressed its purport and succeeded in forgetting it. A horror of incest and an enormous sense of guilt are left over from this prehistoric epoch of the individual's existence. It may be that something quite similar occurred in the prehistoric epoch of the human species as a whole and that the beginnings of morality, religion and social order were intimately connected [221] with the surmounting of that primaeval era. To adults their prehistory seems so inglorious that they refuse to allow themselves to be reminded of it: they were infuriated when psychoanalysis tried to lift the veil of amnesia from their years of childhood. There was only one way out: what psychoanalysis asserted must be false and what posed as a new science must be a tissue of fancies and distortions.

Thus the strongest resistances to psychoanalysis were not of an intellectual kind but arose from emotional sources. This explained their passionate character as well as their poverty in logic. The situation obeyed a simple formula: men in the mass behaved to psychoanalysis in precisely the same way as individual neurotics under treatment for their disorders. It is possible, however, by patient work to convince these latter individuals that everything happened as we maintained it did: we had not invented it ourselves but had arrived at it from a study of other neurotics covering a period of twenty or thirty years. The position was at once alarming and consoling: alarming because it was no small thing to have the whole human race as one's patient, and consoling because after all everything was taking place as the hypotheses of psychoanalysis declared that it was bound to.

If we cast our eyes once again over the various resistances to

psychoanalysis that have been enumerated, it is evident that only a minority of them are of the kind which habitually arise against most scientific innovations of any considerable importance. The majority of them are due to the fact that powerful human feelings are hurt by the subject matter of the theory. Darwin's theory of descent met with the same fate, since it tore down the barrier that had been arrogantly set up between men and beasts. I drew attention to this analogy in an earlier paper,[1] in which I showed how the psychoanalytic view of the relation of the conscious ego to an overpowering unconscious was a severe blow to human self-love. I described this as the *psychological* blow to men's narcissism, and compared it with the *biological* blow delivered by the theory of descent and the earlier *cosmological* blow aimed at it by the discovery of Copernicus.

Purely external difficulties have also contributed to strengthen the resistance to psychoanalysis. It is not easy to arrive at an independent [222] judgement upon matters to do with analysis without having experienced it oneself or practised it on someone else. Nor can one do the latter without having acquired a specific and decidedly delicate technique, while until recently there was no easily accessible means of learning psychoanalysis and its technique. This position has now been improved by the foundation (in 1920) of the Berlin Psychoanalytic Clinic and Training Institute, and soon afterwards (in 1922) of a very similar institute in Vienna.

Finally, with all reserve, the question may be raised whether the personality of the present writer as a Jew who has never sought to disguise the fact that he is a Jew may not have had a share in provoking the antipathy of his environment to psychoanalysis. An argument of this kind is not often uttered aloud. But we have unfortunately grown so suspicious that we cannot avoid thinking that this factor may not have been quite without its effect. Nor is it perhaps entirely a matter of chance that the first advocate of psychoanalysis was a Jew. To profess belief in this new theory called for a certain degree of readiness to accept a situation of solitary opposition – a situation with which no-one is more familiar than a Jew.

1 'A Difficulty in the Path of Psychoanalysis' (1917*a*) [*RSE*, **17**].

APPENDIX

EXTRACT FROM SCHOPENHAUER'S *THE WORLD AS WILL AND IDEA*[1]

[223] In his later works, Freud made several references to the emphasis which Schopenhauer laid on the importance of sexuality. As well as mentioning the subject on p. 215 above, he also referred to it in the closing paragraph of 'A Difficulty in the Path of Psychoanalysis' (1917*a*), *RSE*, **17**, 133, and in the Preface (written in 1920) to the fourth edition of the *Three Essays* (1905*d*), ibid., **7**, 119. It appears again in Chapter VI of *Beyond the Pleasure Principle* (1920*g*), ibid., **18**, 48 – a work which Freud was revising at about the same time as he wrote the Preface just mentioned – and yet again near the end of Chapter V of the *Autobiographical Study* (1925*d*), ibid., **20**, 52.

Freud sometimes alluded specifically to 'an intensely impressive passage' or 'words of unforgettable impressiveness', though he nowhere quoted the passage or indicated its source in Schopenhauer's writings. It seems highly likely, however, that the extract printed here is from the passage Freud had in mind, and it is, therefore, perhaps of interest to reproduce it. This paragraph occurs in the Supplements to the Fourth Book of *The World as Will and Idea*, Chapter XLII, 'The Life of the Species' ['*Leben der Gattung*']. Immediately before this point, Schopenhauer has been discussing the character of sexual desire, which he declares is different from every other desire: '. . . it is not only the strongest but even specifically of a more powerful kind than any other.' He gives examples of the recognition accorded in antiquity to this power and continues as follows:

'To all this corresponds the important role which the relation of the sexes plays in the world of men, where it is really the invisible central point of all action and conduct, and peeps out everywhere in spite of all veils thrown over it. It is the cause of war and the end of peace, the basis of what is serious, and the aim of the jest, the
[224] inexhaustible source of wit, the key to all allusions, and the meaning of all mysterious hints, of all unspoken offers and all stolen glances, the daily meditation of the young, and often also of the old, the hourly thought of the unchaste, and even against their will the constantly recurring imagination of the chaste, the ever ready material of a joke, just because the profoundest seriousness lies at its foundation. It is, however, the piquant element and the joke of life that the chief concern of all men is secretly pursued and ostensibly ignored as much as possible. But, in fact, we see it every moment seat itself, as the true hereditary lord of the world, out of the fulness of its own strength, upon the ancestral throne, and looking down from

1 Translated by R. B. Haldane & J. Kemp, 1886, **3**, 313–14. The extract is printed by arrangement with Messrs. George Allen & Unwin.

thence with scornful glances, laugh at the preparations which have been made to bind it, imprison it, or at least to limit it and wherever it is possible to keep it concealed, or even so to master it that it shall only appear as a subordinate, secondary concern of life. But all this agrees with the fact that the sexual passion[1] is the kernel of the will to live, and consequently the concentration of all desire; therefore in the text I have called the genital organs the focus of the will. Indeed, one may say man is concrete sexual desire[1]; for his origin is an act of copulation and his wish of wishes is an act of copulation, and this tendency alone perpetuates and holds together his whole phenomenal existence. The will to live manifests itself indeed primarily as an effort to sustain the individual, yet this is only a step to the effort to sustain the species, and the latter endeavour must be more powerful in proportion as the life of the species surpasses that of the individual in duration, extension and value. Therefore sexual passion[1] is the most perfect manifestation of the will to live, its most distinctly expressed type; and the origin of the individual in it, and its primacy over all other desires of the natural man, are both in complete agreement with this.'

1 ['*Geschlechtstrieb*' in the original – a word which, when used by Freud, is translated 'sexual drive' in the *Revised Standard Edition*.]

A NOTE UPON THE 'MYSTIC WRITING-PAD'

The present translation is a very slightly revised and corrected reprint of the *SE* version.

This paper was probably written in the autumn of 1924, for Freud reported in a letter to Abraham of November 25 of that year that he was revising it. The curious little apparatus, which is the basis of this ingenious and illuminating discussion of the conscious, preconscious and perceptual-conscious systems, is still quite easily obtainable under various trade names with minor variations in structure and materials which do not alter the essential principles that Freud discusses. The subject matter of the paper will become much clearer if an actual specimen can be examined and dissected.

A NOTE UPON THE 'MYSTIC WRITING-PAD'

If I distrust my memory – neurotics, as we know, do so to a remarkable extent, but normal people have every reason for doing so as well – I am able to supplement and guarantee its working by making a note in writing. In that case the surface upon which this note is preserved, the pocketbook or sheet of paper, is as it were a materialized portion of my mnemic apparatus, which I otherwise carry about with me invisible. I have only to bear in mind the place where this 'memory' has been deposited and I can then 'reproduce' it at any time I like, with the certainty that it will have remained unaltered and so have escaped the possible distortions to which it might have been subjected in my actual memory. [227]

If I want to make full use of this technique for improving my mnemic function, I find that there are two different procedures open to me. On the one hand, I can choose a writing surface which will preserve intact any note made upon it for an indefinite length of time – for instance, a sheet of paper which I can write upon in ink. I am then in possession of a 'permanent memory trace'. The disadvantage of this procedure is that the receptive capacity of the writing surface is soon exhausted. The sheet is filled with writing, there is no room on it for any more notes, and I find myself obliged to bring another sheet into use, that has not been written on. Moreover, the advantage of this procedure, the fact that it provides a 'permanent trace', may lose its value for me if after a time the note ceases to interest me and I no longer want to 'retain it in my memory'. The alternative procedure avoids both of these disadvantages. If, for instance, I write with a piece of chalk on a slate, I have a receptive surface which retains its receptive capacity for an unlimited time and the notes upon which can be destroyed as soon as they cease to interest me, without any need for throwing away the writing surface itself. Here the disadvantage is that I cannot preserve a permanent trace. If I want to put some fresh notes on the slate, I must first wipe out the ones which cover it. Thus an unlimited receptive capacity and a

retention of permanent traces seem to be mutually exclusive properties
[228] in the apparatus which we use as substitutes for our memory: either the receptive surface must be renewed or the note must be destroyed.

All the forms of auxiliary apparatus which we have invented for the improvement or intensification of our sensory functions are built on the same model as the sense organs themselves or portions of them: for instance, spectacles, photographic cameras, ear-trumpets.[1] Measured by this standard, devices to aid our memory seem particularly imperfect, since our mental apparatus accomplishes precisely what they cannot: it has an unlimited receptive capacity for new perceptions and nevertheless lays down permanent – even though not unalterable – memory traces of them. As long ago as in 1900 I gave expression in *The Interpretation of Dreams*[2] to a suspicion that this unusual capacity was to be divided between two different systems (or organs of the mental
Seele [*seelischen*]^{T} apparatus). According to this view, we possess a system *Pcpt.-Cs.*, which receives perceptions but retains no permanent trace of them, so that it can react like a clean sheet to every new perception; while the permanent traces of the excitations which have been received are preserved in 'mnemic systems' lying behind the perceptual system. Later, in *Beyond the Pleasure Principle* [1920*g*],[3] I added a remark to the effect that the inexplicable phenomenon of consciousness arises in the perceptual system *instead of* the permanent traces.

Now some time ago there came upon the market, under the name of the 'Mystic Writing-Pad', a small contrivance that promises to perform more than the sheet of paper or the slate. It claims to be nothing more than a writing-tablet from which notes can be erased by an easy movement of the hand. But if it is examined more closely it will be found that its construction shows a remarkable agreement with my hypothetical structure [*Bau*]^{T} of our perceptual apparatus and that it can in fact provide both an ever-ready receptive surface and permanent traces of the notes that have been made upon it.

The Mystic Pad is a slab of dark-brown resin or wax with a paper
[229] edging; over the slab is laid a thin transparent sheet, the top end of which is firmly secured to the slab while its bottom end rests on it without being fixed to it. This transparent sheet is the more interesting part of the little device. It itself consists of two layers, which can be detached

1 [This notion is expanded in Chapter III of *Civilization and its Discontents* (1930*a*), *RSE*, **21**, 83.]

2 [Ibid., **5**, 482 f. As Freud mentions in *Beyond the Pleasure Principle* (1920*g*), ibid., **18**, 24 f., this distinction had already been drawn by Breuer in his theoretical section of *Studies on Hysteria* (1895*d*), ibid., **2**, 168 *n*.]

3 [Ibid., **18**, 25.]

from each other except at their two ends. The upper layer is a transparent piece of celluloid; the lower layer is made of thin translucent waxed paper. When the apparatus is not in use, the lower surface of the waxed paper adheres lightly to the upper surface of the wax slab.

To make use of the Mystic Pad, one writes upon the celluloid portion of the covering-sheet which rests on the wax slab. For this purpose no pencil or chalk is necessary, since the writing does not depend on material being deposited on the receptive surface. It is a return to the ancient method of writing on tablets of clay or wax: a pointed stilus scratches the surface, the depressions upon which constitute the 'writing'. In the case of the Mystic Pad this scratching is not effected directly, but through the medium of the covering-sheet. At the points which the stilus touches, it presses the lower surface of the waxed paper on to the wax slab, and the grooves are visible as dark writing upon the otherwise smooth whitish-grey surface of the celluloid. If one wishes to destroy what has been written, all that is necessary is to raise the double covering-sheet from the wax slab by a light pull, starting from the free lower end.[1] The close contact between the waxed paper and the wax slab at the places which have been scratched (upon which the visibility of the writing depended) is thus brought to an end and it does not recur when the two surfaces come together once more. The Mystic Pad is now clear of writing and ready to receive fresh notes.

The small imperfections of the contrivance have, of course, no importance for us, since we are concerned only with its approximation to the structure of the perceptual apparatus of the mind.

If, while the Mystic Pad has writing on it, we cautiously raise the celluloid from the waxed paper, we can see the writing just as clearly on the surface of the latter, and the question may arise why there should be any necessity for the celluloid portion of the cover. Experiment will [230]
then show that the thin paper would be very easily crumpled or torn if one were to write directly upon it with the stilus. The layer of celluloid thus acts as a protective sheath for the waxed paper, to keep off injurious effects from without. The celluloid is a 'protective shield against stimuli' [*Reizschutz*]; the layer which actually receives the stimuli is the paper. I may at this point recall that in *Beyond the Pleasure Principle* [*RSE*, **18**, 27 ff.] I showed that the perceptual apparatus of our mind consists of two layers, of an external protective shield against stimuli whose task it is to diminish the strength of excitations [*Erregungen*][T]

1 [The method by which the covering-sheet is detached from the wax slab is slightly different in the current form of the device; but this does not affect the principle.]

coming in, and of a surface behind it which receives the stimuli, namely the system *Pcpt.-Cs*.

The analogy would not be of much value if it could not be pursued further than this. If we lift the entire covering-sheet – both the celluloid and the waxed paper – off the wax slab, the writing vanishes and, as I have already remarked, does not reappear again. The surface of the Mystic Pad is clear of writing and once more capable of receiving impressions. But it is easy to discover that the permanent trace of what was written is retained upon the wax slab itself and is legible in suitable lights. Thus the Pad provides not only a receptive surface that can be used over and over again, like a slate, but also permanent traces of what has been written, like an ordinary paper pad: it solves the problem of combining the two functions *by dividing them between two separate but interrelated component parts or systems*. But this is precisely the way in which, according to the hypothesis which I mentioned just now, our mental apparatus performs its perceptual function. The layer which receives the stimuli – the system *Pcpt.-Cs*. – forms no permanent traces; the foundations of memory come about in other, adjoining, systems.

We need not be disturbed by the fact that in the Mystic Pad no use is made of the permanent traces of the notes that have been received; it is enough that they are present. There must come a point at which the analogy between an auxiliary apparatus of this kind and the organ which is its prototype will cease to apply. It is true, too, that once the writing has been erased, the Mystic Pad cannot 'reproduce' it from within; it would be a mystic pad indeed if, like our memory, it could accomplish that. Nonetheless, I do not think it is too far-fetched to
[231] compare the celluloid and waxed paper cover with the system *Pcpt.-Cs*. and its protective shield, the wax slab with the unconscious behind them, and the appearance and disappearance of the writing with the flickering up and passing away of consciousness in the process of perception.

But I must admit that I am inclined to press the comparison still further. On the Mystic Pad the writing vanishes every time the close contact is broken between the paper which receives the stimulus and the wax slab which preserves the impression. This agrees with a notion [*Vorstellung*][T] which I have long had about the method by which the perceptual apparatus of our mind functions, but which I have hitherto kept to myself.[1] My theory was that cathectic

1 [It had in fact been mentioned in *Beyond the Pleasure Principle* (1920*g*), *RSE*, **18**, 28. The notion reappears at the end of the paper on 'Negation' (1925*h*), below, p. 240. It is already present in embryo at the end of Section 19 of Part I of the 'Project' of 1895 (Freud, 1950*a*).]

innervations [*Besetzungsinnervationen*][T] are sent out and withdrawn in rapid periodic impulses from within into the completely pervious system *Pcpt.-Cs*. So long as that system is cathected in this manner, it receives perceptions (which are accompanied by consciousness) and passes the excitation on to the unconscious mnemic systems; but as soon as the cathexis is withdrawn, consciousness is extinguished and the functioning of the system comes to a standstill.[1] It is as though the unconscious stretches out feelers, through the medium of the system *Pcpt.-Cs.*, towards the external world and hastily withdraws them as soon as they have sampled the excitations coming from it.[2] Thus the interruptions, which in the case of the Mystic Pad have an external origin, were attributed by my hypothesis to the discontinuity in the current of innervation; and the actual breaking of contact which occurs in the Mystic Pad was replaced in my theory by the periodic non-excitability of the perceptual system. I further had a suspicion that this discontinuous method of functioning of the system *Pcpt.-Cs.* lies at the bottom of the origin of the concept of time.[3] *Besetzung*

If we imagine one hand writing upon the surface of the Mystic Writing-Pad while another periodically raises its covering-sheet from the wax slab, we shall have a concrete representation of the way in which I tried to picture the functioning of the perceptual apparatus of our mind. [232]

1 [This is in accordance with the 'principle of the insusceptibility to excitation of uncathected systems', which is discussed in an Editors' footnote to the metapsychological paper on dreams (1916–17*f* [1915]), *RSE*, **14**, 201 *n.* 2.]

2 [It is noteworthy that Freud seems to use 'the unconscious' in its systematic sense here. The notion of perceptual consciousness ultimately deriving from endogenous cathexes is consistent with some earlier suggestions that all the energy in the mental apparatus derives from its interior (Freud, 1950*a*; ibid., **1**, 413 ff.) and that consciousness itself was originally an endogenous function (1911*b*), ibid., **12**, 217. See also the Editors' footnote in ibid., **1**, 313 *n.* 2.]

3 [This also had been suggested in *Beyond the Pleasure Principle*, ibid., **18**, 28, and hinted at earlier, in 'The Unconscious' (1915*e*), ibid., **14**, 165–6. It is restated in 'Negation' (1925*h*), p. 240 below, where, however, Freud attributes the sending out of feelers to the ego.]

NEGATION

The present translation is a reprint of the *SE* version, slightly modified and corrected.

We are told by Ernest Jones (1957, 125) that this was written in July, 1925. The subject had, however, evidently been in Freud's thoughts for some time, as is shown by the footnote added by him to the 'Dora' case history in 1923. (See p. 241 below.) The paper is one of his most succinct. Though primarily it deals with a special point of metapsychology, yet in its opening and closing passages it touches upon technique. It can be seen from the references in the footnotes that both of these aspects of the paper had a long previous history.

Ilse Grubrich-Simitis (1993, 212–13; trans., 166–7) reveals that, curiously, the manuscript was originally entitled 'Negation and Disavowal'. The latter concept is nowhere mentioned in the text, suggesting that Freud may have changed his mind about his purposes in the process of writing it. The two concepts are, however, closely related. In this connection, see the discussion of the translation of '*Verleugnung*' in *RSE*, **24**, 92. See also ibid., **24**, 127.

NEGATION

The manner in which our patients bring forward their associations [*Einfälle*][T] during the work of analysis gives us an opportunity for making some interesting observations. 'Now you'll think I mean to say something insulting, but really I've no such intention.' We realize that this is a repudiation [*Abweisung*], by projection, of an idea [*Einfälles*] that has just come up. Or: 'You ask who this person in the dream can be. It's *not* my mother.' We emend this to: 'So it *is* his mother.' In our interpretation [*Deutung*][T], we take the liberty of disregarding the negation and of picking out the subject matter alone of the association. It is as though the patient had said: 'It's true that my mother came into my mind as I thought of this person, but I don't feel inclined to let the association count.'[1] [235]

There is a very convenient method by which we can sometimes obtain a piece of information we want about unconscious repressed [*Verdrängte*][T] material. 'What', we ask, 'would you consider the most unlikely imaginable thing in that situation? What do you think was furthest from your mind at that time?' If the patient falls into the trap and says what he thinks is most incredible, he almost always makes the right admission. A neat counterpart to this experiment is often met with in an obsessional neurotic who has already been initiated into the meaning of his symptoms. 'I've got a new obsessive idea,' he says, 'and it occurred to me at once that it might mean so and so. But no; that can't be true, or it couldn't have occurred to me.' What he is rejecting [*verwirft*], on grounds picked up from his treatment, is, of course, the correct meaning of the obsessive idea. *Verdrängung*

Thus the content of a repressed image or idea [*Vorstellungs- oder Gedankeninhalt*][T] can make its way into consciousness, on condition *Vorstellung*

1 [Freud had drawn attention to this in (among other places) the 'Rat Man' analysis (1909*d*), *RSE*, **10**, 141 *n*. 2.]

that it is *negated*.[1] Negation is a way of taking cognizance of what is
[236] repressed; indeed, it is already a lifting of the repression, though not, of course, an acceptance of what is repressed. We can see how in this the intellectual function is separated from the affective process. With the help of negation only one consequence of the process of repression is undone – the fact, namely, of the ideational content [*Vorstellungsinhalt*] of what is repressed not reaching consciousness. The outcome of this is a kind of intellectual acceptance of the repressed, while at the same time what is essential to the repression persists.[2] In the course of analytic work we often produce a further, very important and somewhat strange variant of this situation. We succeed in conquering the negation as well, and in bringing about a full intellectual acceptance of the repressed; but the repressive process itself is not yet removed by this.

Since to affirm or negate the content of thoughts is the task of the function of intellectual judgement, what we have just been saying has led us to the psychological origin of that function. To negate something in a judgement is, at bottom, to say: 'This is something which I should prefer to repress.' A negative judgement [*Verurteilung*][t] is the intellectual substitute for repression:[3] its 'no' is the hallmark of repression, a certificate of origin – like, let us say, 'Made in Germany'.[4] With the help of the symbol of negation, thinking [*das Denken*] frees itself from the restrictions of repression and enriches itself with material that is indispensable for its proper functioning.

The function of judgement is concerned in the main with two sorts of decisions. It affirms or disaffirms [*absprechen*] the possession by a thing [*Ding*] of a particular attribute; and it asserts or disputes [*bestreiten*] that a presentation [*Vorstellung*] has an existence in reality.[5]
[237] The attribute to be decided about may originally have been good or bad,

1 [The German '*verneinen*' is here translated by 'to negate' instead of by the more usual 'to deny', in order to avoid confusion with the German '*verleugnen*', which has also in the past been rendered by 'to deny'. In this edition 'to disavow' has in general been used for the latter German word. See the footnote on this point in 'The Infantile Genital Organization' (1923*e*), p. 133 *n.* 1 above. See also the discussion of this distinction in *RSE*, **24**, 92 and 127.]

2 The same process is at the root of the familiar superstition that boasting is dangerous. 'How nice not to have had one of my headaches for so long.' But this is in fact the first announcement of an attack, of whose approach the subject is already sensible, although he is as yet unwilling to believe it. [Freud's attention had first been drawn to this explanation by one of his earliest patients, Frau Cäcilie M. Cf. the long footnote on the subject in the first of Freud's case histories in *Studies on Hysteria* (1895*d*), ibid., **2**, 67 *n.* 2.]

3 [Freud's earliest statement of this idea seems to have been in his book on *Jokes* (1905*c*), ibid., **8**, 152. It reappears in the paper on 'The Two Principles of Mental Functioning' (1911*b*), ibid., **12**, 217, and in the metapsychological paper on 'The Unconscious' (1915*e*), ibid., **14**, 164.]

4 [In English in the original.]

5 [This is explained below, p. 239.]

useful or harmful. Expressed in the language of the oldest – the oral – drive impulses [*Triebregungen*][T], the judgement is: 'I should like to eat this', or 'I should like to spit it out'; and, put more generally: 'I should like to take this into myself and to keep that out.' That is to say: 'It shall be inside me' or 'it shall be outside me'. As I have shown elsewhere, the original pleasure ego [*Lust-Ich*][T] wants to introject into itself everything that is good and to eject from itself everything that is bad. What is bad, what is alien to the ego and what is external are, to begin with, identical for it.[1]

Trieb, Regung

Lust, Ich

The other sort of decision made by the function of judgement – as to the real existence of something of which there is a presentation (reality-testing) – is a concern of the definitive reality ego, which develops out of the initial pleasure ego. It is now no longer a question of whether or not what has been perceived (a thing) shall be taken into the ego, but of whether something which is in the ego as a presentation can be rediscovered in perception (reality) as well. It is, we see, once more a question of *external* and *internal*. What is unreal, merely a presentation and subjective, is only internal; what is real is also there *outside*. In this stage of development regard for the pleasure principle has been set aside. Experience has shown the subject that it is not only important whether a thing (an object of satisfaction for him) possesses the 'good' attribute and so deserves to be taken into his ego, but also whether it is there in the external world, so that he can get hold of it whenever he needs it. In order to understand this step forward we must recollect that all presentations originate from perceptions and are repetitions of them. Thus originally the mere existence of a presentation was a guarantee of the reality of what was presented [*des Vorgestellten*]. The antithesis between subjective and objective does not exist from the first. It only comes into being from the fact that thinking possesses the capacity to bring before the mind [*in der Vorstellung*] once more something that has once been perceived, by reproducing it as a presentation without the external object having still to be there. The first and immediate aim, therefore, of reality-testing is, not to *find* an object in real perception which corresponds to the one presented, but to *refind* such an object, to convince oneself that it is still there.[2] Another capacity of the power of [238]

1 See the discussion in 'Drives and their Vicissitudes' (1915*c*). [*RSE*, **14**, 119 f. – Freud took up this question again in the first chapter of *Civilization and its Discontents* (1930*a*), ibid., **21**.]

2 [Much of this is foreshadowed in *The Interpretation of Dreams* (1900*a*), ibid., **5**, 505–7, and, more particularly, in the 1895 'Project' (Freud, 1950*a*; Section 16 of Part I). Here the 'object' to be refound is the mother's breast. Cf., too, a sentence which occurs in a similar connection in Essay III, Section 5, of the *Three Essays* (1905*d*), ibid., **7**, 196: 'The finding of an object is in fact a refinding of it.']

thinking offers a further contribution to the differentiation between what is subjective and what is objective. The reproduction of a perception as a presentation is not always a faithful one; it may be modified by omissions, or changed by the merging of various elements. In that case, reality-testing has to ascertain how far such distortions go. But it is evident that a precondition for the setting up of reality-testing is that objects shall have been lost which once brought real satisfaction.

Judging is the intellectual action which decides the choice of motor action, which[t] puts an end to the postponement due to thought and which leads over from thinking to acting. This postponement due to thought has also been discussed by me elsewhere.[1] It is to be regarded as an experimental action [*Probeaktion*], a motor palpating [*Tasten*][t], *abführen* with small expenditure of discharge [*Abfuhraufwänden*][T]. Let us consider where the ego has used a similar kind of palpating before, at what place it learnt the technique which it now applies in its processes of *Seele* thought. It happened at the sensory end of the mental [*seelischen*][T] apparatus, in connection with sense perceptions. For, on our hypothesis, perception is not a purely passive process. The ego periodically sends *Besetzung* out small amounts of cathexis [*Besetzungsmengen*][T] into the perceptual system, by means of which it samples the external stimuli, and then after every such tentative advance it draws back again.[2]

[239] The study of judgement affords us, perhaps for the first time, an insight into the origin of an intellectual function from the interplay of the primary drive impulses. Judging is a continuation, along lines of expediency, of the original process by which the ego took things into itself or expelled them from itself, according to the pleasure principle. The polarity of judgement appears to correspond to the opposition of the two groups of drives which we have supposed to exist. Affirmation – as a substitute for uniting – belongs to Eros; negation – the successor to expulsion – belongs to the drive to destruction. The general wish to negate, the negativism which is displayed by some psychotics, is probably to be regarded as a sign of a defusion of drives that has taken place

1 [See *The Ego and the Id* (1923*b*), p. 49 above. But Freud made the point repeatedly, beginning with the 'Project' of 1895 (at the end of Section 17 of Part I). A list of references can be found in Lecture XXXII of the *New Introductory Lectures* (1933*a*), *RSE*, **22**, 79 *n.* Incidentally, the whole topic of judgement is discussed at great length and on much the same lines as the present ones in Sections 16, 17 and 18 of Part I of the 'Project'.]

2 [See *Beyond the Pleasure Principle* (1920*g*), ibid., **18**, 27 f., and 'A Note upon the "Mystic Writing-Pad"' (1925*a*), p. 230 f. above. It may be remarked that in this last passage Freud suggests not that the ego but that the *unconscious* 'stretches out feelers, through the medium of the system *Pcpt.-Cs.*, towards the external world'.]

through a withdrawal of the libidinal components.[1] But the performance of the function of judgement is not made possible until the creation of the symbol of negation has endowed thinking with a first measure of freedom from the consequences of repression and, with it, from the compulsion of the pleasure principle.

This view of negation fits in very well with the fact that in analysis we never discover a 'no' in the unconscious and that recognition of the unconscious on the part of the ego is expressed in a negative formula. There is no stronger evidence that we have been successful in our effort to uncover the unconscious than when the patient reacts to it with the words 'I didn't think that', or 'I didn't (ever) think of that'.[2]

1 [Cf. a remark in Chapter VI of the book on *Jokes* (1905*c*), *RSE*, **8**, 152 *n*. 2.]

2 [Freud had made this point in almost the same words in a footnote added in 1923 to the 'Dora' analysis (1905*e*), ibid., **7**, 52 *n*. 1. He once more returned to it in his very late paper on 'Constructions in Analysis' (1937*d*), ibid., **23**, 239.]

SOME PSYCHICAL CONSEQUENCES OF THE ANATOMICAL DISTINCTION BETWEEN THE SEXES

The present translation is a revised and corrected reprint of the *SE* version.

This paper was finished by August, 1925, when Freud showed it to Ferenczi. It was read on his behalf by Anna Freud at the Homburg International Psychoanalytical Congress on September 3, and was published in the *Zeitschrift* later in the autumn (Jones, 1957, 119).

What is in effect a first complete reassessment of Freud's views on the psychological development of women can be found condensed in this short paper. It contains the germs of all his later work on the subject.

From early days Freud made complaints of the obscurity enveloping the sexual life of women. Thus, near the beginning of his *Three Essays on the Theory of Sexuality* (1905*d*), he wrote that the sexual life of men 'alone has become accessible to research. That of women . . . is still veiled in an impenetrable obscurity.' (*RSE*, **7**, 135.) Similarly, in his discussion of the sexual theories of children (1908*c*), he

[244] wrote: 'In consequence of unfavourable circumstances, both of an external and an internal nature, the following observations apply chiefly to the sexual development of one sex only – that is, of males.' (*RSE*, **9**, 185.) Again, very much later, in his pamphlet on lay analysis (1926*e*): 'We know less about the sexual life of little girls than of boys. But we need not feel ashamed of this distinction; after all, the sexual life of adult women is a "dark continent" for psychology.' (Ibid., **20**, 188.)[1]

One result of this obscurity was to lead Freud to assume very often that the psychology of women could be taken simply as analogous to that of men. There are many examples of this. In his first full account of the Oedipus situation, for instance, in *The Interpretation of Dreams* (1900*a*), he assumes that there is a complete parallel between the two sexes, that 'a girl's first affection is for her father and a boy's first childish desires are for his mother' (ibid., **4**, 228). Similarly, in his long description of the sexual development of children in Lecture XXI of the *Introductory Lectures* (1916–17*a*) he writes: 'As you see, I have only described the relation of a *boy* to his father and mother. Things happen in just the same way with little girls, with the necessary changes: an affectionate attachment to her father, a need to get rid of her mother as superfluous . . .' (Ibid., **16**, 293–4.) Or, speaking of the early history of identification in *Group Psychology* (1921*c*): 'The same holds good, with the necessary substitutions, of the baby daughter as well' (ibid., **18**, 98). Even in *The Ego and the Id* (1923*b*) the complicated processes accompanying and following the dissolution of the Oedipus complex are supposed to be 'precisely analogous' in girls and
[245] boys (p. 28 above).[2] Or the account of the female Oedipus complex may simply be omitted, as in the article for Marcuse's encyclopaedia (1923*a*), *RSE*, **18**, 239. On the other hand, in describing the 'phallic phase' in the paper on the infantile genital organization (1923*e*) Freud writes frankly: 'Unfortunately we can describe this state of things only as it affects the male child; the corresponding processes in the little girl are not known to us' (p. 132 above).

But in fact over a long period from the time of the 'Dora' analysis in 1900, Freud's interest had not been directed to feminine psychology. It was not for fifteen years that he published any important case material dealing with a woman. Then came the case of female paranoia 'running counter to psychoanalytic theory' (1915*f*), *RSE*, **14**, the essence of which lay in the patient's relation to her mother. Not long after came the case of female homosexuality (1920*a*), ibid., **18**, of which the same might well be said. Between them came the study of beating phantasies (1919*e*), which was almost wholly concerned with the infantile sexual development of girls. And here

1 Ernest Jones writes (1955, 468): 'There is little doubt that Freud found the psychology of women more enigmatic than that of men. He said once to Marie Bonaparte: "The great question that has never been answered and which I have not yet been able to answer, despite my thirty years of research into the feminine soul, is 'What does a woman want?'" Unfortunately Jones gives no date for this remark. Freud himself suggests a part explanation of his difficulty in the last paragraph of Section I of his later paper on 'Female Sexuality' (1931*b*), *RSE*, **21**, 216 f., where he attributes it to a peculiarity in his transference relation with women.

2 A similar position was adopted in the *Autobiographical Study* (1925*d*): 'boys concentrate their sexual wishes upon their mother and develop hostile impulses against their father as being a rival, while girls adopt an analogous attitude' (ibid., **20**, 31). But here Freud added a footnote in 1935 with a drastic correction of his earlier views and an explanation of how they arose: 'The information about infantile sexuality was obtained from the study of men and the theory deduced from it was concerned with male children. It was natural enough to expect to find a complete parallel between the two sexes; but this turned out not to hold.' And he went on to give the gist of the findings first announced in the present paper.

already there is clear evidence of dissatisfaction with the 'precise analogy' between the two sexes: 'the expectation of there being a complete parallel was mistaken' (*RSE*, **17**, 191). Thereafter the problem of the sexual history of women was no doubt constantly in Freud's mind. And although there is little about it in *The Ego and the Id* (1923*b*), it was the theories developed there concerning the end of the Oedipus complex which, linked with fresh clinical observations, gave the key to the new thesis. Freud was already feeling his way towards it in 'The Dissolution of the Oedipus Complex' (1924*d*) but it is fully stated for the first time in the present paper. It was to be further enlarged on in the later paper on 'Female Sexuality' (1931*b*),[1] *RSE*, **21**, in Lecture XXXIII of the *New Introductory Lectures* (1933*a*), ibid., **22**, and finally in Chapter VII of the posthumous *Outline of Psychoanalysis* (1940*a* [1938]), ibid., **23**.

Almost every detail is already present in a condensed form in this work. But it is [246]
remarkable that many of these details had been ready to hand long before and only required linking up. Thus certain peculiarities in the sexual development of girls had been noted and insisted upon. Already in the first edition of the *Three Essays* (1905*d*) Freud had maintained that in little girls the leading sexual organ was the clitoris, that, in conformity with this fact, 'the sexuality of little girls is of a wholly masculine character', and that a 'wave of repression at puberty' is required before the clitoris gives place to the vagina and masculinity to femininity (ibid., **7**, 193–6). Most of this had, indeed, been indicated many years before in a letter to Fliess of November 14, 1897 (Freud, 1950*a*, Letter 75). The matter was carried further in the paper on 'The Sexual Theories of Children' (1908*c*), where it was brought into relation with the girl's envy for the penis and the castration complex (ibid., **9**, 189–90).[2] The fact that the injury to her narcissism caused by this leads to resentment against her mother was pointed out in the paper on 'Some Character-Types' (1916*d*), ibid., **14**, 319; and other grounds for this resentment had been enumerated in the paranoia case history a little earlier (1915*f*), ibid., **14**, 265.

Nor had the fundamental basis of the new thesis been unstated – though for long periods it seemed forgotten. In the *Three Essays* we find the plain statement that a child's first sexual object is the mother's breast and that this is the prototype of every later love relation (ibid., **7**, 196). This was clearly meant to be true of girls as well as boys, but it seems to be repeated explicitly for the first time here (p. 252 below).[3] The twofold change required of the little girl before she could arrive at the 'normal' Oedipus complex thus became evident: a change in her leading sexual organ and a change in her sexual object. And the path lay open for an investigation of her 'pre-Oedipus' phase, together with the differences between girls and boys implied by the hypotheses in *The Ego and the Id* – the difference in the relation of their castration and [247]
Oedipus complexes and the further difference in the construction of their superegos. It is the synthesis of these various pieces of knowledge, derived from such widely separated historical strata of Freud's work, which gives its importance to the present paper.

1 The most important addition made in this was the discovery, based on fresh case material, of the strength and duration of the little girl's pre-Oedipus attachment to her mother.

2 This was further discussed in 'The Taboo of Virginity' (1918*a*), *RSE*, **11**.

3 In the paper on narcissism (1914*c*), this primary fact is again stated (ibid., **14**, 75–7), but somehow passed over; and the distinction between the early libidinal objects of boys and girls becomes concentrated on the distinction between the anaclitic and narcissistic types of object choice.

SOME PSYCHICAL CONSEQUENCES OF THE ANATOMICAL DISTINCTION BETWEEN THE SEXES[t]

In my own writings and in those of my followers more and more stress is laid on the necessity that the analyses of neurotics shall deal thoroughly with the remotest period of their childhood, the time of the early efflorescence of sexual life [*Sexuallebens*][T]. It is only by examining the first manifestations of the patient's innate drive constitution [*Triebkonstitution*][T] and the effects of his earliest experiences that we can accurately gauge the driving forces [*Triebkräfte*] that have led to his neurosis and can be secure against the errors into which we might be tempted by the degree to which things have become remodelled and overlaid in adult life. This requirement is not only of theoretical but also of practical importance, for it distinguishes our efforts from the work of those physicians whose interests are focused exclusively on therapeutic results and who employ analytic methods, but only up to a certain point. An analysis of early childhood such as we are considering is tedious and laborious and makes demands both upon the physician and upon the patient which cannot always be met. Moreover, it leads us into dark regions where there are as yet no signposts. Indeed, analysts may feel reassured, I think, that there is no risk of their work becoming mechanical, and so of losing its interest, during the next few decades. [248] *Sex* *Trieb*

In the following pages I bring forward some findings [*Ergebnis*] of analytic research which would be of great importance if they could be proved to apply universally. Why do I not postpone publication of them until further experience has given me the necessary proof [*Nachweis*], if such proof is obtainable? Because the conditions under which I work have undergone a change, with implications which I cannot disguise [*verleugnen*][T]. Formerly, I was not one of those who are unable to hold back what seems to be a new discovery until it has been either confirmed or corrected. My *The Interpretation of Dreams* (1900*a*) and my 'Fragment of an Analysis of a Case of Hysteria' (1905*e*) (the case of Dora) were suppressed by me – if not for the nine years enjoined by Horace[1] – at *Verleugnung*

1 [The reference is to his *Ars Poetica*, line 388.]

all events for four or five years before I allowed them to be published.
[249] But in those days I had unlimited time before me – 'oceans of time'[1] as an amiable author puts it – and material poured in upon me in such quantities that fresh experiences were hardly to be escaped. Moreover, I was the only worker in a new field, so that my reticence involved no danger to myself and no loss to others.

But now everything has changed. The time before me is limited. The whole of it is no longer spent in working, so that my opportunities for making fresh observations are not so numerous. If I think I see something new, I am uncertain whether I can wait for it to be confirmed. And further, everything that is to be seen upon the surface has already been exhausted; what remains has to be slowly and laboriously dragged up from the depths. Finally, I am no longer alone. An eager crowd of fellow workers is ready to make use of what is unfinished or doubtful, and I can leave to them that part of the work which I should otherwise have done myself. On this occasion, therefore, I feel justified in publishing something which stands in urgent need of confirmation before its value or lack of value can be decided.

In examining the earliest psychical shapes [*Gestaltungen*] assumed by the sexual life of children we have been in the habit of taking as the subject of our investigations the male child, the little boy. With little girls, so we have supposed, things must be similar, though in some way or other they must nevertheless be different. The point in development at which this difference lay could not be clearly determined.

In boys the situation of the Oedipus complex is the first stage that can be recognized with certainty. It is easy to understand, because at that stage a child retains the same object which he previously cathected
Besetzung [*besetzt*][T] with his libido – not as yet a genital one – during the preceding period while he was being suckled and nursed. The fact, too, that in this situation he regards his father as a disturbing rival and would like to get rid of him and take his place is a straightforward consequence of the actual state of affairs. I have shown elsewhere[2] how the Oedipus attitude
[250] in little boys belongs to the phallic phase, and how its collapse [*zugrunde*

1 [In English in the original. The reference is presumably to Shelley's poem 'Time':
'Unfathomable Sea! whose waves are years,
Oceans of Time, whose waters of deep woe
Are brackish with the salt of human tears!'
(Identified thus in the *OCEP*, **17**, 267 *n.* a.)]

2 'The Dissolution of the Oedipus Complex' [(1924*d*), this volume, p. 167 ff. Much of what follows is an elaboration of that paper.]

geht] is brought about by the fear of castration – that is, by narcissistic interest in their genitals. The matter is made more difficult to grasp by the complicating circumstance that even in boys the Oedipus complex has a double orientation, active and passive, in accordance with their bisexual constitution; a boy also wants to take his *mother's* place as the love object of his *father* – a fact which we describe as the feminine attitude.[1]

As regards the prehistory of the Oedipus complex in boys we are far from complete clarity. We know that that period includes an identification of an affectionate sort with the boy's father, an identification which is still free from any sense of rivalry in regard to his mother. Another element of that stage is invariably, I believe, a masturbatory activity in connection with the genitals, the masturbation of early childhood, the more or less violent suppression of which by those in charge of the child sets the castration complex in action. It is to be assumed that this masturbation is attached to the Oedipus complex and serves as a discharge [*Abfuhr*][T] for the sexual excitation [*Sexualerregung*][T] belonging to it. It is, however, uncertain whether the masturbation has this character from the first, or whether on the contrary it makes its first appearance spontaneously as an activity of a bodily organ and is brought into relation with the Oedipus complex only at some later date; this second possibility is by far the more probable. Another doubtful question is the part played by bedwetting and by the breaking of that habit through the intervention of training measures. We are inclined to make the simple connection that continued bedwetting is a result of masturbation and that its suppression is regarded by boys as an inhibition [*Hemmung*][T] of their genital activity – that is, as having the meaning of a threat of castration;[2] but whether we are always right in supposing this remains to be seen. Finally, analysis shows us in a shadowy way how the fact of a child at a very early age listening to his parents copulating may set up his first sexual excitation, and how that event may, owing to its after-effects [*nachträglichen Wirkungen*][T], act as a starting point for the child's whole sexual development. Masturbation, as well as the two attitudes in the Oedipus complex, later on become attached to this early experience, the child having subsequently interpreted [*gedeuteten*][T] its meaning. It is impossible, however, to suppose that these observations of coitus are of universal occurrence, so that at this point we are faced with the

2 [Cf. ibid., p. 168 f.]

Phantasie

problem of 'primal phantasies' [*Urphantasien*][T].[1] Thus the prehistory of the Oedipus complex, even in boys, raises all of these questions for sifting and explanation; and there is the further problem of whether we are to suppose that the process invariably follows the same course, or whether a great variety of different preliminary stages may not converge upon the same terminal situation.

In little girls the Oedipus complex raises one problem more than in boys. In both cases the mother is the original object; and there is no cause for surprise that boys retain that object in the Oedipus complex. But how does it happen that girls abandon it and instead take their father as an object? In pursuing this question I have been able to reach some conclusions which may throw light precisely on the prehistory of the Oedipus relation in girls.

Every analyst has come across certain women who cling with particular intensity and tenacity to the attachment to their father and to the wish in which it culminates of having a child by him. We have good reason to suppose that the same wishful phantasy was also the driving force [*Triebkraft*] of their infantile masturbation, and it is easy to form an impression that at this point we have been brought up against an elementary and unanalysable fact of infantile sexual life. But a thorough analysis of these very cases brings something different to light – namely, that here the Oedipus complex has a long prehistory and is in some respects a secondary formation.

The old paediatrician Lindner [1879] once remarked that a child discovers the genital zones (the penis or the clitoris) as a source of pleasure

Lust

[*Lustquelle*][T] while indulging in sensual sucking (thumbsucking).[2] I shall leave it an open question whether it is really true that the child takes the newly found source of pleasure in exchange for the recent loss of the mother's nipple – a possibility to which later phantasies (fellatio) seem to point. Be that as it may, the genital zone is discovered at some time

[252]

or other, and there seems no justification for attributing any psychical content to the first activities in connection with it. But the first step in the phallic phase which begins in this way is not the linking up of the masturbation with the object cathexes of the Oedipus complex, but a momentous discovery which little girls are destined to make. They notice the penis of a brother or playmate, strikingly visible and of large

1 [Cf. the discussions in the 'Wolf Man' analysis (1918*b*), *RSE*, **17**, especially 43–54 and 85–7, and Lecture XXIII of the *Introductory Lectures* (1916–17*a*), ibid., **16**.]

2 Cf. *Three Essays on the Theory of Sexuality* (1905*d*) [ibid., **7**, 159].

proportions, at once recognize it as the superior counterpart of their own small and inconspicuous organ, and from that time forward fall victim to envy for the penis.

There is an interesting contrast between the behaviour of the two sexes. In the analogous situation, when a little boy first catches sight of a girl's genital region, he begins by showing irresolution and lack of interest; he sees nothing or disavows [*verleugnet*][1] what he has seen, he softens it down or looks about for expedients for bringing it into line with his expectations. It is not until later, when some threat of castration has obtained a hold upon him, that the observation becomes important to him: if he then recollects or repeats it, it arouses a terrible storm of emotion in him and forces him to believe in the reality of the threat which he has hitherto laughed at. This combination of circumstances leads to two reactions, which may become fixed and will in that case, whether separately or together or in conjunction with other factors, permanently determine the boy's relations to women: horror of the mutilated creature or triumphant contempt for her. These developments, however, belong to the future, though not to a very remote one.

A little girl behaves differently. She makes her judgement and her decision in a flash. She has seen it and knows that she is without it and wants to have it.[2]

Here what has been named the masculinity complex of women [253]
branches off.[3] It may put great difficulties in the way of their regular development towards femininity, if it cannot be got over soon enough. The hope of some day obtaining a penis in spite of everything and so of becoming like a man may persist to an incredibly late age and may become a motive [*Motiv*][T] for strange and otherwise unaccountable actions. Or again, a process may set in which I should like to call a

1 [See Editors' footnote to 'The Infantile Genital Organization', p. 133 *n.* 1 above.]

2 This is an opportunity for correcting a statement which I made many years ago. I believed that the sexual interest of children, unlike that of pubescents, was aroused, not by the difference between the sexes [*Geschlechtsunterschied*], but by the problem of where babies come from. We now see that, at all events with girls, this is certainly not the case. With boys it may no doubt happen sometimes one way and sometimes the other; or with both sexes chance experiences may determine the event. – [The statement mentioned at the beginning of this footnote appears in more than one place: e.g. in the paper on 'The Sexual Theories of Children' (1908*c*), *RSE*, **9**, 186, in the case history of 'Little Hans' (1909*b*), ibid., **10**, 101, and in a passage added in 1915 to the *Three Essays* (1905*d*), ibid., **7**, 172. In a passage earlier than any of these, however, in a paper on 'The Sexual Enlightenment of Children' (1907*c*), ibid., **9**, 114, Freud in fact takes the opposite view – the one advocated here.]

3 [This term seems to have been introduced by Van Ophuijsen (1917). Freud adopted it in '"A Child is Being Beaten"' (1919*e*), *RSE*, **17**, 186, and in 'Female Sexuality' (1931*b*), ibid., **21**, 220 *n.* 1. Cf. also p. 171 f. above.]

Seele 'disavowal',[1] a process which in the mental life [*Seelenleben*][T] of children seems neither uncommon nor very dangerous but which in an adult would mean the beginning of a psychosis. Thus a girl may refuse to accept the fact of being castrated, may harden herself in the conviction that she *does* possess a penis, and may subsequently be compelled to behave as though she were a man.

The psychical consequences of envy for the penis, insofar as it does not become absorbed in the reaction-formation of the masculinity complex, are various and far-reaching. After a woman has become aware of the wound to her narcissism, she develops, like a scar, a sense of inferiority.[2] When she has passed beyond her first attempt at explaining her lack of a penis as being a punishment personal to herself and has realized that that sexual character [*Geschlechtscharakters*] is a universal one, she begins to share the contempt felt by men for a sex which is the lesser in so important a respect, and, at least in holding that opinion, insists on being like a man.[3]

[254] Even after penis envy has abandoned its true object, it continues to exist: by an easy displacement [*Verschiebung*][T] it persists in the character trait of *jealousy*. Of course, jealousy is not limited to one sex and has a wider foundation than this, but I am of the opinion that it plays a far larger part in the mental life of women than of men and that that is because it is enormously reinforced from the direction of displaced penis envy. While I was still unaware of this source of jealousy and was considering the phantasy 'a child is being beaten', which occurs so commonly in girls, I constructed a first phase for it in which its meaning was that another child, a rival of whom the subject was jealous, was to be beaten.[4] This phantasy seems to be a relic of the phallic period in girls. The peculiar rigidity which struck me so much in the monotonous

1 [For the parallel process in boys, see 'The Infantile Genital Organization' (1923*e*), pp. 133–4 above.]

2 [Cf. *Beyond the Pleasure Principle* (1920*g*), *RSE*, **18**, 20.]

3 In my first critical account of the 'History of the Psychoanalytic Movement' (1914*d*) [ibid., **14**, 47–8], I recognized that this fact represents the core of truth contained in Adler's theory. That theory has no hesitation in explaining the whole world by this single point ('organ inferiority', the 'masculine protest', 'breaking away from the feminine line') and prides itself upon having in this way robbed sexuality of its importance and put the desire for power in its place! Thus the only organ which could claim to be called 'inferior' without any ambiguity would be the clitoris. On the other hand, one hears of analysts who boast that, though they have worked for dozens of years, they have never found a sign of the existence of a castration complex. We must bow our heads in recognition of the greatness of this achievement, even though it is only a negative one, a piece of virtuosity in the art of overlooking and mistaking. The two theories form an interesting pair of opposites: in the latter not a trace of a castration complex, in the former nothing else than its consequences.

4 '"A Child is Being Beaten"' (1919*e*) [ibid., **17**, 180].

formula 'a child is being beaten' can probably be interpreted in a special way. The child which is being beaten (or caressed) may ultimately be nothing more nor less than the clitoris itself, so that at its very lowest level the statement will contain a confession of masturbation, which has remained attached to the content of the formula from its beginning in the phallic phase till later life.

A third consequence of penis envy seems to be a loosening of the girl's affectionate relation with her maternal object. The situation as a whole is not very clear, but it can be seen that in the end the girl's mother, who sent her into the world so insufficiently equipped, is almost always held responsible for her lack of a penis. The way in which this comes about historically is often that soon after the girl has discovered that her genitals are unsatisfactory she begins to show jealousy of another child on the ground that her mother is fonder of it than of her, which serves as a reason for her giving up her attachment to her mother. It will fit in with this if the child which has been preferred by her mother is made into the first object of the beating phantasy which ends in masturbation.

There is yet another surprising effect of penis envy, or of the discovery [255]
of the inferiority of the clitoris, which is undoubtedly the most important of all. In the past I had often formed an impression that in general women tolerate masturbation worse than men, that they more frequently fight against it and that they are unable to make use of it in circumstances in which a man would seize upon it as a way of escape without any hesitation. Experience would no doubt elicit innumerable exceptions to this statement, if we attempted to turn it into a rule. The reactions of human individuals of both sexes are of course made up of masculine and feminine traits. But it appeared to me nevertheless as though masturbation were further removed from the nature of women than of men, and the solution to the problem could be assisted by the reflection that masturbation, at all events of the clitoris, is a masculine activity and that the elimination of clitoridal sexuality is a necessary precondition for the development of femininity.[1] Analyses of the remote phallic period have now taught me that in girls, soon after the first signs of penis envy, an intense current of feeling against masturbation makes its appearance, which cannot be attributed exclusively to the educational influence of those in charge of the child. This impulse [*Regung*]^{T} is clearly a forerunner of the wave of repression [*Verdrängungsschubes*]^{T} *Verdrängung*

1 [A reference to clitoridal masturbation in girls appeared in the first edition of the *Three Essays* (1905*d*), *RSE*, **7**, 194 f. In the course of his 'Contributions to a Discussion on Masturbation' (1912*f*), Freud expressed regret at the lack of knowledge about female masturbation (ibid., **12**, 242 f.).]

which at puberty will do away with a large amount of the girl's masculine sexuality in order to make room for the development of her femininity. It may happen that this first opposition to auto-erotic activity fails to attain its end. And this was in fact the case in the instances which I analysed. The conflict continued, and both then and later the girl did everything she could to free herself from the compulsion to masturbate. Many of the later manifestations of sexual life in women remain unintelligible unless this powerful motive is recognized.

I cannot explain the opposition which is raised in this way by little girls to phallic masturbation except by supposing that there is some concurrent factor which turns her violently against that pleasurable
[256] activity. Such a factor lies close at hand. It cannot be anything else than her narcissistic sense of humiliation which is bound up with penis envy, the reminder that after all this is a point on which she cannot compete with boys and that it would therefore be best for her to give up the idea of doing so. Thus the little girl's recognition of the anatomical distinction between the sexes forces her away from masculinity and masculine masturbation on to new lines which lead to the development of femininity.

So far there has been no question of the Oedipus complex, nor has it up to this point played any part. But now the girl's libido slips into a new position along the line – there is no other way of putting it – of the equation 'penis–child'. She gives up her wish for a penis and puts in place of it a wish for a child: and *with that purpose in view* she takes her father as a love object.[1] Her mother becomes the object of her jealousy. The girl has turned into a little woman. If I am to credit a single analytic instance, this new situation can give rise to physical sensations which would have to be regarded as a premature awakening of the female genital apparatus. When the girl's attachment to her father comes to grief later on and has to be abandoned, it may give place to an identification with him and the girl may thus return to her masculinity complex and perhaps remain fixated in it.

I have now said the essence of what I had to say: I will stop, therefore, and cast an eye over our findings. We have gained some insight into the prehistory of the Oedipus complex in girls. The corresponding period in boys is more or less unknown. In girls the Oedipus complex is a secondary formation. The operations of the castration complex precede it and prepare for it. As regards the relation between the Oedipus and

1 [Cf. 'The Dissolution of the Oedipus Complex' (1924*d*), p. 172 above.]

castration complexes there is a fundamental contrast between the two sexes. *Whereas in boys the Oedipus complex collapses through the castration complex,*[1] *in girls it is made possible and led up to by the castration complex.* This contradiction is cleared up if we reflect that the castration complex always operates in the sense implied in its subject matter: it inhibits and limits masculinity and encourages femininity. The difference between the sexual development of males and females at the stage we have been considering is an intelligible consequence of the anatomical [257] distinction between their genitals and of the psychical situation involved in it; it corresponds to the difference between a castration that has been carried out and one that has merely been threatened. In their essentials, therefore, our findings are self-evident and it should have been possible to foresee them.

The Oedipus complex, however, is such an important thing that the manner in which one enters and leaves it cannot be without its effects. In boys (as I have shown at length in the paper to which I have just referred [1924*d*] and to which all of my present remarks are closely related) the complex is not simply repressed, it is literally smashed to pieces [*zerschellt förmlich*] by the shock of threatened castration. Its libidinal cathexes are abandoned, desexualized and in part sublimated; its objects are incorporated into the ego [*Ich*][T], where they form the nucleus of the superego [*Über-Ichs*][T] and give that new structure its characteristic qualities. In normal, or, it is better to say, in ideal cases, the Oedipus complex exists no longer, even in the unconscious; the superego has become its heir. Since the penis (to follow Ferenczi [1924]) owes its extraordinarily high narcissistic cathexis to its organic significance for the propagation of the species, the catastrophe to the Oedipus complex (the abandonment of incest and the institution of conscience and morality) may be regarded as a victory of the generation[2] over the individual. This is an interesting point of view when one considers that neurosis is based upon a struggle of the ego against the demands of the sexual function. But to leave the standpoint of individual psychology is not of any immediate help in clarifying this complicated situation.

In girls the motive for the demolition of the Oedipus complex is lacking. Castration has already had its effect, which was to force the child into the situation of the Oedipus complex. Thus the Oedipus complex escapes the fate [*Schicksal*][T] which it meets with in boys: it may be slowly abandoned or dealt with by repression, or its effects may persist

1 [1924*d*, p. 171 above.]

2 [*Generation*. Translated as 'race' in the *SE*.]

far into women's normal mental life. I cannot evade the notion (though I hesitate to give it expression) that for women the level of what is ethically normal is different from what it is in men. Their superego is never so inexorable, so impersonal, so independent of its emotional origins as we require it to be in men. Character traits which critics of every epoch have brought up against women – that they show less sense of justice
[258] than men, that they are less ready to submit to the great exigencies of life, that they are more often influenced in their judgements by feelings of affection or hostility – all these would be amply accounted for by the modification in the formation of their superego which we have inferred above. We must not allow ourselves to be deflected from such conclusions by the denials of the feminists, who are anxious to force us to regard the two sexes as completely equal in position and worth; but we shall, of course, willingly agree that the majority of men are also far behind the masculine ideal and that all human individuals, as a result of their bisexual disposition and of cross-inheritance, combine in themselves both masculine and feminine characteristics, so that pure masculinity and femininity remain theoretical constructions of uncertain content.

I am inclined to set some value on the considerations I have brought forward upon the psychical consequences of the anatomical distinction between the sexes. I am aware, however, that this opinion can only be maintained if my findings, which are based on a handful of cases, turn out to have general validity and to be typical. If not, they would remain no more than a contribution to our knowledge of the different paths along which sexual life develops.

In the valuable and comprehensive studies on the masculinity and castration complexes in women by Abraham (1921), Horney (1923) and Helene Deutsch (1925) there is much that touches closely on what I have written but nothing that coincides with it completely, so that here again I feel justified in publishing this paper.

The present translation is a slightly revised and corrected reprint of the *SE* version.

Josef Popper (1838–1921) was an engineer by profession, but was well known in Austria for his writings (under the pseudonym of 'Lynkeus'), mainly on philosophical and sociological topics. An account of his schemes of social reform can be found in a book by Fritz Wittels, published in English under the title *An End to Poverty* (London, 1925). This also contains a short biography of Popper himself by the translators, Eden & Cedar Paul. The volume of short imaginative sketches, *Phantasien eines Realisten*, which is the subject of Freud's remarks, was highly popular and passed through many editions, the twenty-first having appeared in 1921. Freud's paper was no doubt written on the occasion of its author's death, for publication in a periodical which, as its title shows, called for the universal provision of subsistence and owed its inspiration to Popper. Freud wrote another and longer paper on the same subject some ten years later (1932*c*). See also Freud's Preface to *Lynkeus' New State* (1939–40*a*) in *RSE*, **22**, 277.

JOSEF POPPER-LYNKEUS AND THE THEORY OF DREAMS

There is much of interest to be said on the subject of apparent scientific originality. When some new idea comes up in science, which is hailed at first as a discovery and is also as a rule disputed as such, objective research soon afterwards reveals that after all it was in fact no novelty. Usually the discovery has already been made repeatedly and has afterwards been forgotten, often at very long intervals of time. Or at least it has had forerunners, had been obscurely surmised or incompletely enunciated. This is too well known to call for further discussion. [261]

But the subjective side of originality also deserves consideration. A scientific worker may sometimes ask himself what was the source of the ideas peculiar to himself which he has applied to his material. As regards some of them he will discover without much reflection the hints from which they were derived, the statements made by other people which he has picked out and modified and whose implications he has elaborated. But as regards others of his ideas he can make no such acknowledgements; he can only suppose that these thoughts and lines of approach were generated – he cannot tell how – in his own mental activity [*Denktätigkeit*], and it is on them that he bases his claim to originality.

Careful psychological investigation, however, diminishes this claim still further. It reveals hidden and long-forgotten sources which gave the stimulus to the apparently original ideas, and it replaces the ostensible new creation with a revival of something forgotten applied to fresh material. There is nothing to regret in this; we had no right to expect that what was 'original' could be untraceable and undetermined.

In my case, too, the originality of many of the new ideas employed by me in the interpretation of dreams [*Traumdeutung*][T] and in psychoanalysis has evaporated in this way. I am ignorant of the source of only one of these ideas. It was no less than the key to my view of dreams and helped me to solve their riddles, so far as it has been possible to solve them hitherto. I started out from the strange, confused and senseless *Deutung*

character of so many dreams, and hit upon the notion that dreams
[262] were bound to become like that because something was struggling for expression in them which was opposed by a resistance from other
Macht, Seele mental forces [*Mächte des Seelenlebens*][T]. In dreams hidden impulses [*Regungen*][T] were stirring which stood in contradiction to what might be called the dreamer's official ethical and aesthetic creed; the dreamer was thus ashamed of these impulses, turned away from them and refused to acknowledge them in daytime, and if during the night he could not withhold expression of some kind from them, he submitted them to a 'dream distortion' which made the content of the dream appear confused and senseless. To the mental force in human beings which keeps watch on this internal contradiction and distorts the dream's primitive
Trieb drive impulses [*Triebregungen*][T] in favour of conventional or of higher moral standards, I gave the name of 'dream censorship'.

Precisely this essential part of my theory of dreams was, however, discovered by Popper-Lynkeus independently. I will ask the reader to compare the following quotation from a story called 'Träumen wie Wachen' ['Dreaming like Waking'] in his *Phantasien eines Realisten*[I] [*Phantasies of a Realist*] which was certainly written in ignorance of the theory of dreams which I published in 1900, just as I myself was then in ignorance of Lynkeus's *Phantasien*[T]:

'About a man who has the remarkable attribute of never dreaming nonsense. . . .

"'This splendid gift of yours, for dreaming as though you were waking, is a consequence of your virtues, of your kindness, your sense of justice, and your love of truth; it is the moral serenity of your nature which makes me understand all about you."

"'But when I think the matter over properly", replied the other, "I almost believe that everyone is made like me, and that no-one at all ever dreams nonsense. Any dream which one can remember clearly enough to describe it afterwards – any dream, that is to say, which is not a feverdream – must *always* make sense, and it cannot possibly be otherwise. For things that were mutually contradictory could not group themselves into a single whole. The fact that time and space are often thrown into confusion does not affect the true content of the dream, since no doubt neither of them is of significance for its real essence. We often do the
[263] same thing in waking life. Only think of fairy tales and of the many daring products of the imagination, which are full of meaning and of

1 [First edition, Vienna, 1899.]

which only a man without intelligence could say: 'This is nonsense, for it is impossible.'"

"'If only one always knew how to interpret dreams in the right way, as you have just done with mine!" said his friend.

"'That is certainly no easy task; but with a little attention on the part of the dreamer himself it should no doubt always succeed. – You ask why it is that for the most part it does *not* succeed? In you other people there seems always to be something that lies concealed in your dreams, something unchaste in a special and higher sense, a certain secret quality in your being which it is hard to follow. And that is why your dreams so often seem to be without meaning or even to be nonsense. But in the deepest sense this is not in the least so; indeed, it cannot be so at all – for it is always the same man, whether he is awake or dreaming.'"

I believe that what enabled *me* to discover the cause of dream distortion was my moral courage. In the case of Popper it was the purity, love of truth and moral serenity of his nature.[1]

1 [These were the epithets applied by Popper himself to the man in his story. Freud returned to the subject in a later paper 'My Contact with Josef Popper-Lynkeus' (1932*c*), *RSE*, **22**, 234–5, where a further short quotation from the story can be found. Freud first commented on the coincidence between his views and those of Popper in his 'Postscript' added in 1909 to Chapter I of *The Interpretation of Dreams* (1900*a*), ibid., **4**, 84, and in a footnote added in 1909 to Chapter VI (B) of the same work (ibid., 275 *n.* 2), where he quoted the same passage as in the present paper. – The question of the 'originality' of his discoveries was raised by Freud in a passage also added in 1909 to Chapter II of *The Interpretation of Dreams* (1900*a*), ibid., 91, in some passages in the first section of his 'History of the Psychoanalytic Movement' (1914*d*), ibid., **14**, 10–16, and in 'A Note on the Prehistory of the Technique of Analysis' (1920*b*), ibid., **18**, 253–5.]

DR SÁNDOR FERENCZI

(on his 50th Birthday)

Not many years after its publication (in 1900), *The Interpretation of Dreams* fell into the hands of a young Budapest physician, who, although he was a neurologist, psychiatrist and expert in forensic medicine, was eagerly in search of new scientific knowledge. He did not get far in reading the book; very soon he had thrown it aside – whether out of boredom or disgust is not known. Soon afterwards, however, the call for fresh possibilities of work and discovery took him to Zürich, and thence he was led to Vienna to meet the author of the book that he had once contemptuously cast aside. This first visit was succeeded by a long, intimate and hitherto untroubled friendship, in the course of which he too made the journey to America in 1909 to lecture at Clark University at Worcester, Mass.[1] [267]

Such were the beginnings of Ferenczi, who has since himself become a master and teacher of psychoanalysis and who in the present year, 1923, completes alike the fiftieth anniversary of his birth and the first decade of his leadership of the Budapest Psychoanalytical Society.

Ferenczi has repeatedly played a part, too, in the external affairs of psychoanalysis. His appearance at the Second Analytical Congress, at Nuremberg in 1910, will be remembered, where he proposed and helped to bring about the foundation of an International Psychoanalytical Association as a means of defence against the contempt with which analysis was treated by official medicine. At the Fifth Analytical Congress, at Budapest, in September, 1918, he was elected President of the Association. He appointed Anton von Freund as Secretary; and there is no doubt that the combined energy of the two men, together with Freund's generous schemes of endowment, would have made Budapest the analytic capital of Europe, had not political catastrophes and personal tragedy put a merciless end to these fair hopes. Freund fell ill and died in January, 1920.[2] In view of Hungary's isolation from

1 [Cf. *Five Lectures on Psychoanalysis* (Freud, 1910*a*), *RSE*, **11**.]

2 [See Freud's obituary of him (1920*c*), ibid., **18**.]

[268] contact with the rest of the world, Ferenczi had resigned his position in October, 1919, and had transferred the Presidency of the International Association to Ernest Jones in London. For the duration of the Soviet Republic in Hungary[1] Ferenczi had been allotted the functions of a university teacher, and his lectures had attracted crowded audiences. The Component Society, which he had founded in 1913,[2] survived every storm and, under his guidance, became a centre of intense and productive work and was distinguished by an accumulation of abilities such as were exhibited in combination by no other Component Society. Ferenczi, who, as a middle child in a large family, had to struggle with a powerful brother complex, had, under the influence of analysis, become an irreproachable elder brother, a kindly teacher and promoter of young talent.

Ferenczi's analytic writings have become universally known and appreciated. It was not until 1922 that his *Popular Lectures on Psycho-Analysis* were published by our *Verlag* [publishing house] as Volume XIII of the 'Internationale Psychoanalytische Bibliothek'. These lectures, clear and formally perfect, sometimes most fascinatingly written, offer what is in fact the best 'Introduction to Psychoanalysis'[3] for those who are unfamiliar with it. There is still no [German] collection of his purely technical [psychoanalytic] medical writings, a number of which have been translated into English by Ernest Jones. The *Verlag* will fulfil this task as soon as more favourable times make it possible.[4] Those of his books and papers which have appeared in Hungarian have passed through many editions and have made analysis familiar to educated circles in Hungary.

Ferenczi's scientific achievement is impressive above all from its many-sidedness. Besides well-chosen case histories and acutely observed
[269] clinical communications ('A Little Chanticleer' [1913*a*], 'On Transitory Symptom-Constructions during the Analysis' [1912*a*], and shorter clinical works) we find exemplary critical writings such as those upon Jung's *Wandlungen und Symbole der Libido* [1913*b*], upon Régis & Hesnard's views on psychoanalysis [1915*b*], as well as effective polemical writings

1 [Under Béla Kun, March to August, 1919.]

2 Its Inaugural General Meeting was held on May 19, 1913, with Ferenczi as President, Dr Radó as Secretary, and Drs Hollós, Ignotus and Lévy as members.

3 [This is an allusion to the German title of Freud's own *Introductory Lectures*, published a few years earlier (1916–17*a*), *RSE*, **15–16**.]

4 [A complete German edition of Ferenczi's shorter works, *Bausteine zur Psychoanalyse*, was published in four volumes from 1927 to 1939. An equally comprehensive English edition has appeared in three volumes, of which the first, the one mentioned in the text above, was originally published in 1916.]

such as those against Bleuler on alcohol [1911*b*] and against Putnam on the relation between psychoanalysis and philosophy [1912*b*], moderate and dignified in spite of their decisiveness. But besides all these there are the papers upon which Ferenczi's fame principally rests, in which his originality, his wealth of ideas and his command over a well-directed scientific imagination find such happy expression, and with which he has enlarged important sections of psychoanalytic theory and has promoted the discovery of fundamental situations in mental life: 'Introjection and Transference', including a discussion of the theory of hypnosis [1909], 'Stages in the Development of the Sense of Reality' [1913*c*] and his discussion of symbolism [1912*c*]. Finally there are the works of these last few years – *Psychoanalysis and the War Neuroses* [1919*a*], *Hysterie und Pathoneurosen* [1919*b*] and, in collaboration with Hollós, *Psychoanalysis and the Psychic Disorder of General Paresis* [1922] (in which the medical interest advances from the psychological conditions to the somatic determinants), and his approaches to an 'active' therapy.

However incomplete this enumeration may seem to be, his friends know that Ferenczi has held back even more than he has been able to make up his mind to communicate.[1] On his fiftieth birthday they are united in wishing that he may be granted strength, leisure and a frame of mind to bring his scientific plans to realization in fresh achievements.

1 [Freud returned to this point in his obituary of Ferenczi, written just ten years later (1933*c*), *RSE*, **22**, 242.]

PREFACE TO AICHHORN'S *WAYWARD YOUTH* (1925)

EDITORS' NOTE

PREFACE TO AICHHORN'S *VERWAHRLOSTE JUGEND*

GERMAN EDITIONS

1925 In August Aichhorn, *Verwahrloste Jugend*, Leipzig, Vienna and Zürich: Internationaler Psychoanalytischer Verlag, 5–6. (1931, 2nd ed.) [272]
1928 *GS*, **11**, 267–9.
1948 *GW*, **14**, 565–7.

ENGLISH TRANSLATIONS

1935 In Aichhorn, *Wayward Youth*, New York: Viking Press, v–vii. (Reprinted 1936, London: Putnam.) (Tr. unspecified.)
1950 *CP*, **5**, 98–100. (Under the title 'Psycho-Analysis and Delinquency'.) (Tr. James Strachey.)
1951 In Aichhorn, *Wayward Youth*, London: Imago Publishing Co., vii–ix. (Revised reprint of 1935 edition, but with Freud's Preface tr. James Strachey.)
1961 *SE*, **19**, 273–5. (Very slightly corrected version of the 1950 translation.)

The present translation is a slightly revised and corrected version of the *SE* version.

A biographical study of August Aichhorn (1878–1949), by Dr K. R. Eissler, appears in the 1951 edition of the English translation of *Wayward Youth*. Aichhorn's book was first published in July, 1925. Freud made a further short reference to it in a footnote to Chapter VII of *Civilization and its Discontents* (1930*a*), *RSE*, **21**, 117 *n*. 2.

A fuller discussion of the relations between psychoanalysis and education was given by Freud in a long passage in the middle of Lecture XXXIV of his *New Introductory Lectures* (1933*a*), ibid., **22**.

PREFACE TO AICHHORN'S *WAYWARD YOUTH*

None of the applications of psychoanalysis has excited so much interest and aroused so many hopes, and none, consequently, has attracted so many capable workers, as its use in the theory and practice of education [*Kindererziehung*]^{T}. It is easy to understand why; for children have become the main subject of psychoanalytic research and have thus replaced in importance the neurotics on whom its studies began. Analysis has shown how the child lives on, almost unchanged, in the sick man as well as in the dreamer and the artist; it has thrown light on the driving forces [*Triebkräfte*]^{T} and trends which set its characteristic stamp upon the childish nature; and it has traced the stages through which a child grows to maturity. No wonder, therefore, if an expectation has arisen that psychoanalytic concern with children will benefit the work of education, whose aim it is to guide and assist children on their forward path and to shield them from going astray. [273] *Erziehung*

My personal share in this application of psychoanalysis has been very slight. At an early stage I had accepted the *bon mot* which lays it down that there are three impossible professions – educating, healing and governing – and I was already fully occupied with the second of them. But this does not mean that I overlook the high social value of the work done by those of my friends who are engaged in education.

The present volume by August Aichhorn is concerned with one department of the great problem – with the educational influencing of juvenile delinquents. The author had worked for many years in an official capacity as a director of municipal institutions for delinquents before he became acquainted with psychoanalysis. His attitude to his charges sprang from a warm sympathy [*Anteilnahme*] with the fate of those unfortunates and was correctly guided by an intuitive perception [*intuitive Einfühlung*]^{T} of their mental [*seelische*]^{T} needs.^{t} Psychoanalysis could teach him little that was new of a practical kind, but it brought him a clear theoretical insight into the justification of his way of acting and put him in a position to explain its basis to other people. *Seele*

It must not be assumed that this gift of intuitive understanding will be found in everyone concerned with the bringing up of children. Two
[274] lessons may be derived, it seems to me, from the experience and the success of August Aichhorn. One is that every such person should receive a psychoanalytic training, since without it children, the object of his endeavours, must remain an inaccessible problem to him. A training of this kind is best carried out if such a person himself undergoes an analysis and experiences it on himself: theoretical instruction in analysis fails to penetrate deep enough and carries no conviction.

The second lesson has a somewhat conservative ring. It is to the effect that the work of education is something *sui generis*: it is not to be confused with psychoanalytic influence and cannot be replaced by it. Psychoanalysis can be called in by education as an auxiliary means of dealing with a child; but it is not a suitable substitute for education. Not only is such a substitution impossible on practical grounds but it is also to be disrecommended for theoretical reasons. The relation between education and psychoanalytic treatment will probably before long be the subject of a detailed investigation. Here I will give only a few hints. One should not be misled by the statement – incidentally a perfectly true one – that the psychoanalysis of an adult neurotic is equivalent to an after-education.[1] A child, even a wayward and delinquent child, is still not a neurotic; and after-education is something quite different from the education of the immature. The possibility of analytic influence rests on quite definite preconditions which can be summed up under the term 'analytic situation'; it requires the development of certain psychical structures [*Strukturen*][T] and a particular attitude to the analyst. Where these are lacking – as in the case of children, of juvenile delinquents, and, as a rule, of compulsive [*triebhaften*] criminals – something other than analysis must be employed, though something which will be at one with analysis in its *purpose*. The theoretical chapters of the present volume will give the reader a preliminary grasp of the multiplicity of the decisions involved.

I will end with a further inference, and this time one which is important not for the theory of education but for the status of those who are
[275] engaged in education. If one of these has learnt analysis by experiencing it on his own person and is in a position of being able to employ it in

1 [Freud had used this comparison as early as in his lecture 'On Psychotherapy' (1905*a* [1904]), *RSE*, **7**, 275 f. See also a passage towards the beginning of Lecture XXVIII of the *Introductory Lectures* (1916–17*a*), ibid., **16**.]

borderline[1] and mixed cases to assist him in his work, he should obviously be given the right to practise analysis, and narrow-minded motives should not be allowed to try to put obstacles in his way.

1 [*Grenz- und Mischfällen*. I.e. cases which straddle the borders between education and medicine. Cf. *The Question of Lay Analysis* (1926*e*), *RSE*, **20**, 163 ff.]

JOSEF BREUER

(1925)

EDITORS' NOTE

JOSEF BREUER

GERMAN EDITIONS

1925 *Int. Z. Psychoan.*, **11** (2), 255–6. [278]
1928 *GS*, **11**, 281–3.
1948 *GW*, **14**, 562–3.

ENGLISH TRANSLATIONS

1925 *Int. J. Psycho-Anal.*, **6** (4), 459–60. (Tr. unnamed.)
1961 *SE*, **19**, 279–80. (Tr. James Strachey.)

The present translation is a slightly revised and corrected reprint of the *SE* version.

The last dozen lines of this obituary were quoted at the end of the Editors' Introduction to *Studies on Hysteria* (1895*d*), *RSE*, **2**, xxvi, where a discussion can also be found of the scientific relations between the two collaborators.

JOSEF BREUER

On June 20, 1925, there died in Vienna, in his eighty-fourth year, Josef Breuer, the creator of the cathartic method, whose name is for that reason indissolubly linked with the beginnings of psychoanalysis. [279]

Breuer was a physician, a pupil of the clinician Oppolzer. In his youth he had worked at the physiology of respiration under Ewald Hering, and later, in the scanty hours of leisure allowed by an extensive medical practice, he occupied himself successfully with experiments on the function of the vestibular apparatus in animals. Nothing in his education could lead one to expect that he would gain the first decisive insight into the age-old riddle of the hysterical neurosis and would make a contribution of imperishable value to our knowledge of the human mind [*Seelenlebens*][T]. But he was a man of rich and universal gifts, and his interests extended in many directions far beyond his professional activities. *Seele*

It was in 1880[1] that chance brought into his hands an unusual patient, a girl of more than ordinary intelligence who had fallen ill of severe hysteria while she was nursing her sick father. It was only some fourteen years later, in our joint publication, *Studies on Hysteria* (1895*d*) – and even then unluckily only in a much abbreviated form, censored, too, from considerations of medical discretion – that the world learnt the nature of his treatment of this celebrated 'first case', with what immense care and patience he carried out the technique when once he had discovered it, till the patient was freed from all the incomprehensible symptoms of her illness, and what insight he obtained in the course of the work into the mental mechanisms of the neurosis.

We psychoanalysts, who have long been familiar with the idea of devoting hundreds of sessions to a single patient, can form no conception of how novel such a procedure must have seemed forty-five years ago. It must have called for a large amount of personal interest and, if the phrase can be allowed, of medical libido, but also for a

1 [Breuer was born in 1842.]

considerable degree of freedom of thought and certainty of judgement.
[280] At the date of the publication of our *Studies* we were able to appeal to Charcot's writings and to Pierre Janet's investigations, which had by that time deprived Breuer's discoveries of some of their priority. But when Breuer was treating his first case (in 1881–2) none of this was as yet available. Janet's *L'automatisme psychologique* appeared in 1889 and his second work, *État mental des hystériques*, not until 1892. It seems that Breuer's researches were wholly original, and were directed only by the hints offered to him by the material of his case.

I have repeatedly attempted – most recently in my *Autobiographical Study* (1925*d*), in Grote's series, *Die Medizin der Gegenwart* [*Contemporary Medicine*] – to define my share in the *Studies* which we published jointly. My merit lay chiefly in reviving in Breuer an interest which seemed to have become extinct, and in then urging him on to publication. A kind of reserve which was characteristic of him, an inner modesty, surprising in a man of such a brilliant personality, had led him to keep his astonishing discovery secret for so long that not all of it was any longer new. I found reason later to suppose that a purely emotional factor, too, had given him an aversion to further work on the elucidation of the neuroses. He had come up against something that is never absent – his patient's transference [*Übertragung*][T] on to her physician, and he had not grasped the impersonal nature of the process. At the time when he submitted to my influence and was preparing the *Studies* for publication, his judgement of their significance seemed to be confirmed. 'I believe', he told me, 'that this is the most important thing we two have to give the world.'

Besides the case history of his first patient Breuer contributed a theoretical paper to the *Studies*. It is very far from being out of date; on the contrary, it conceals thoughts and suggestions which have even now not been turned to sufficient account. Anyone immersing himself in this speculative essay will form a true impression of the mental build [*geistigen Format*] of this man, whose scientific interests were, alas, turned in the direction of our psychopathology during only one short episode of his long life.

Shorter Writings

(1923–25)

PREFACE TO MAX EITINGON'S *REPORT ON THE BERLIN PSYCHOANALYTICAL POLICLINIC (MARCH 1920 TO JUNE 1922)* [1]

(1923)

My friend Max Eitingon, who created the Berlin Psychoanalytical Policlinic and has hitherto supported it out of his own resources, has in the following pages made public his reasons for founding it and has also given an account of the Institute's organization and functions. I can only add to what he has written my wish that individuals or societies may be found elsewhere to follow Eitingon's example and bring similar institutions into existence. If psychoanalysis, alongside of its scientific significance, has a value as a therapeutic procedure, if it is capable of giving help to sufferers in their struggle to fulfil the demands of civilization [*kulturellen Forderungen*][T], this help should be accessible as well to the great multitude who are too poor themselves to repay an analyst for his laborious work. This seems to be a social necessity particularly in our times, when the intellectual strata of the population, which are especially prone to neurosis, are sinking irresistibly into poverty.[2] Institutes such as the Berlin Policlinic are also alone in a position to overcome the difficulties which otherwise stand in the way of thorough instruction in psychoanalysis. They make possible the education of a considerable number of trained analysts, whose activity must be regarded as the sole possible protection against injury to patients by ignorant and unqualified persons, whether they are laymen or doctors.

[285]

Kultur

1 [First published in 'Max Eitingon's *Bericht über die Berliner Psychoanalytische Poliklinik (März 1920 bis Juni 1922)*, Leipzig, Vienna and Zürich, 1923, 3; reprinted *GS*, **11** (1928), 265, and *GW*, **13** (1940), 441. Translated in 1961 by James Strachey: *SE*, **19**, 285. The present translation is a very slightly amended reprint of the *SE* version. Some years later Freud wrote a Preface to another pamphlet on the same subject (1930*b*), *RSE*, **21**, 248.]

2 [Freud had discussed this question at greater length in his paper at the Budapest Psychoanalytical Congress (1919*a*), ibid., **17**, 159–61.]

LETTER TO FRITZ WITTELS[1]

(1924 [1923])

[286] You have given me a Christmas present which is very largely occupied with my own personality. The failure to send a word of thanks for such a gift would be an act of rudeness only to be accounted for by very peculiar motives. Fortunately no such motives exist in this case. Your book is by no means hostile; it is not unduly indiscreet; and it manifests the serious interest in the topic which was to be anticipated in so able a writer as yourself.

I need hardly say that I neither expected nor desired the publication of such a book. It seems to me that the public has no concern with my personality, and can learn nothing from an account of it, so long as my case (for manifold reasons) cannot be expounded without any reserves whatever. But you have thought otherwise. Your own detachment from me, which you consider an advantage, entails serious drawbacks nonetheless. You know too little of the object of study, and you have not been able to avoid the danger of straining the facts a little in your analytic endeavours. Moreover, I am inclined to think that your adoption
[287] of Stekel's standpoint, and the fact that you contemplate the object of study from his outlook, cannot but have impaired the accuracy of your discernment.

In some respects, I think there are positive distortions, and I believe

1 [Fritz Wittels (1880–1950) was one of the earliest members of the Vienna Psychoanalytical Society, but left it on some unspecified personal grounds in 1910. In 1924 he published a biography of Freud and sent him an advance copy of the work at the end of 1923. Freud acknowledged it in a letter dated December 18, 1923. Later on, in 1924, an English translation of the book, by Eden & Cedar Paul, was published: *Sigmund Freud: His Personality, his Teaching and his School* (London: Allen & Unwin; New York: Dodd, Mead). This was prefaced 'with Freud's express authorization' by a translation of extracts from his letter to Wittels. The abridged version was reprinted (with very minor changes) in *SE*, **19**, 286. The unabridged letter was then published, in a different translation by Tania & James Stern, in Freud's *Letters* (1960*a*, 345) and in the German original in *GW*, **Nachtr.**, 754. The present translation is a reprint of the *SE* version, slightly revised and emended to include the previously omitted passages (here translated by Mark Solms). The 1924 translation, on which the *SE* version was based, was presumably made by the translators of Wittels's book itself. The previously omitted passages are identified in the footnotes below. It may be added that Wittels was re-elected to the Vienna Psychoanalytical Society in 1927. The letter appears here by arrangement with Messrs George Allen & Unwin.]

these to be the outcome of a preconceived notion of yours. You think that a great man must have such and such merits and defects, and must display certain extreme characteristics; and you hold that I belong to the category of great men. That is why you ascribe to me all sorts of qualities many of which are mutually conflicting. Much of general interest might be said on this matter, but unfortunately your relationship to Stekel precludes further attempts on my part to clear up the misunderstanding.

On the other hand, I am glad to acknowledge that your shrewdness has enabled you to detect some things which are well known to myself. For instance, you are right in inferring that I have often been compelled to make detours when following my own path. You are right, too, in thinking that I have no use for other people's ideas when they are presented to me at an inopportune moment. Also, I am delighted to find that you do me full justice in the matter of my relations to Adler. Admittedly[1] you do not know that I behaved with equal patience and tolerance towards Stekel. I stood by him for a long time, despite his unbearable manners and hopeless approach to science, and forced myself to overlook his profound lack of self-criticism and truthfulness – his external and internal dishonesty – until at last a specific episode of underhandedness and ugly cheating[2] caused me, too, to burst 'every button . . . on my breeches of patience'.[3] (Still, as regards the latter point, I think you might have defended me from the accusation that I am repudiating ideas when I am merely unable for the time being to pass judgement on them or to elaborate them.)

You probably know[4] that I have been seriously ill, and even if I recover this time I have reason to view the experience as a reminder of a not too distant end. In this state of partial disappearance, I may ask to be acquitted of any intention to disturb your relationship with Stekel. I only regret that it has gained such a decisive influence over your book about me.

I realize that you may have occasion to revise your text in view of a second edition. With an eye to this possibility, I enclose a list of suggested

1 [The remainder of this paragraph (apart from the final sentence in parentheses) was omitted in the 1924 and *SE* versions.]

2 [Despite having resigned from the Vienna Psychoanalytical Society, Stekel refused to relinquish his editorship of the *Zentralblatt* (see Jones, 1955, 151 ff.).]

3 ['*alle Knopfe rissen an der Hose der Geduld*'. From Heine's *Romanzero*, Book III (*Hebräische Melodien*), Jehuda ben Halevy IV. Freud cited the same lines in his book on *Jokes* (1905*c*), *RSE*, **8**, 74.]

4 [This entire paragraph was omitted in the 1924 and *SE* versions.]

[288] emendations.[1] These are based on trustworthy data, and are quite independent of my own prepossessions. Some of them relate to matters of trifling importance, but some of them will perhaps lead you to reverse or modify certain inferences. The fact that I send you these corrections is a token that I value your work though I cannot wholly approve it.

1 [A number of these are stated to have been adopted in the English translation. One such correction of Freud's is quoted in full (on pp. 251–2 of the translation). Wittels had suggested that Freud's hypothesis of the 'death drive' in *Beyond the Pleasure Principle* (1920*g*) occurred to him as the result of the death of his daughter. But Freud wrote: 'That seems to me most interesting, and I regard it as a warning. Beyond question, if I had myself been analysing another person in such circumstances, I should have presumed the existence of a connection between my daughter's death and the train of thought presented in *Beyond the Pleasure Principle*. But the inference that such a sequence exists would have been false. The book was written in 1919, when my daughter was still in excellent health. She died in January, 1920. In September, 1919, I had sent the manuscript of the little book to be read by some friends in Berlin [Eitingon and Abraham]. It was finished, except for the discussion concerning the mortality or immortality of the protozoa. What seems true is not always the truth.' – Recent research by Ilse Grubrich-Simitis (1993) has, however, revealed that Wittels's suggestion was more plausible than Freud recognized (see Editors' Note to *Beyond the Pleasure Principle*, *RSE*, **18**, 4).]

LETTER TO SEÑOR LUIS LÓPEZ-BALLESTEROS Y DE TORRES[1]

(1923)

When I was a young student, the desire to read the immortal *Don Quixote* in the original of Cervantes led me to learn, untaught, the lovely Castilian tongue. Thanks to this youthful enthusiasm, I am able today – at an advanced age – to test the accuracy of your Spanish version of my works, the reading of which invariably provokes in me a lively appreciation of your very correct interpretation of my thoughts and of the elegance of your style. I am above all astonished that one who, like you, is neither a doctor nor a psychiatrist by profession should have been able to obtain so absolute and precise a mastery over material which is intricate and at times obscure. [289]

1 [This letter, dated May 7, 1923, was addressed by Freud to the Spanish translator of his works. It was printed in Spanish in Volume IV of *Obras Completas del Professor S. Freud*, Madrid, 1923, 7. Reprinted *GS*, **11** (1928), 266, and *GW*, **13** (1940), 442. No German text is extant, and it is not impossible that Freud wrote it himself in Spanish, of which he had a good knowledge (cf. Jones, 1953, 180). The present translation by James Strachey is reprinted from *SE*, **19** (1961), 289.]

LETTER TO *LE DISQUE VERT*[1]

(1924)

[290] Of the many lessons lavished upon me in the past (1885–6) by the great Charcot at the Salpêtrière,[2] two left me with a deep impression: that one should never tire of considering the same phenomena again and again (or of submitting to their effects), and that one should not mind meeting with contradiction on every side provided one has worked sincerely.

FREUD

1 [In *Le Disque Vert*, **2** (3rd Series) (June), 3. This periodical, issued in Paris and Brussels by Franz Hellens (a pseudonym for Frédéric van Ermengem), published in 1924 a special number with the title 'Freud et la Psychanalyse'. It contained more than 200 pages and contributions of varying length by 36 authors. It was introduced by a short letter from Freud in French dated 'Vienna, February 26, 1924'. A detailed account of the contents of the special number can be found in *Int. Z. Psychoan.*, **10** (1924), 206–8, where the text of Freud's letter is also printed. It was reprinted in *GS*, **11** (1928), 266, and *GW*, **13** (1940), 446. No German text is extant, and the original was perhaps written in French. The present translation by James Strachey is reprinted from *SE*, **19** (1961), 290.]

2 [Cf. Freud's obituary of him (1893*f*), *NSW*, **4**; *RSE*, **3**.]

LETTER TO THE EDITOR OF THE *JEWISH PRESS CENTRE IN ZÜRICH*[1]

(1925)

. . . I can say that I stand as far apart from the Jewish religion as from all other religions: that is to say, they are of great significance to me as a subject of scientific interest, but I have no part in them emotionally. On the other hand I have always had a strong feeling of solidarity with my fellow people, and have always encouraged it in my children as well. We have all remained in the Jewish denomination. [291]

In the time of my youth our free-thinking religious instructors set no store by their pupils' acquiring a knowledge of the Hebrew language and literature. My education in this field was therefore extremely behindhand, as I have since often regretted.

1 [This was first published in the *Jüdische Presszentrale, Zürich* on February 26, 1925. Reprinted *GS*, **11** (1928), 298, and *GW*, **14** (1948), 556. There is no explanation of the apparent omission at the beginning. The present translation by James Strachey is reprinted from *SE*, **19** (1961), 291.]

ON THE OCCASION OF THE OPENING OF THE HEBREW UNIVERSITY[1]

(1925)

[292] Historians have told us that our small nation withstood the destruction of its independence as a State only because it began to transfer in its estimation of values the highest rank to its spiritual possessions, to its religion and its literature.

We are now living in a time when this people has a prospect of again winning the land of its fathers with the help of a Power that dominates the world, and it celebrates the occasion by the foundation of a university in its ancient capital city.

A university is a place in which knowledge is taught above all differences of religions and of nations, where investigation is carried on, which is to show mankind how far they understand the world around them and how far they can control it.

Such an undertaking is a noble witness to the development to which our people has forced its way in two thousand years of unhappy fortune.

I find it painful that my ill-health prevents me from being present at the opening festivities of the Jewish University in Jerusalem.

1 [This was originally published, along with similar messages from other well-known people, in the fortnightly periodical *The New Judaea*, **1** (14), 227, on March 27, 1925. Reprinted *GS*, **11** (1928), 298–9, and *GW*, **14** (1948), 556–7. No German text is extant, and the original English was therefore reprinted in *SE*, **19** (1961), 292 – as it is here – without alteration, except for a change in the title, which in the earlier versions read 'To the Opening of the Hebrew University'. – The University was inaugurated by Lord Balfour in April, 1925.]

EDITORIAL CHANGES IN THE *ZEITSCHRIFT*[1]

(1924)

Dr Otto Rank has acted as editor of this journal ever since its foundation in 1913, even though it is only since 1920 that he has been named on its title page as sole editor. During his period of military service in the war, his place was taken by Dr Hanns Sachs, who was at that time in Vienna. Since the beginning of the current volume Dr S. Ferenczi has also had a share in the editing. [293]

At Easter, 1924, Dr Rank accepted an invitation which took him to New York. On his return home he announced that he had decided to transfer his activity as a teaching and practising analyst to America – at least for a part of the year. Thus it became necessary to place the editorship of the *Zeitschrift* in other hands. It is not within the rights of the Director to give public expression to his opinion of the level and achievements of this journal. No-one who is inclined to appreciate them should overlook or forget how much of its success is due to the tireless devotion and exemplary work of the retiring editor.

Dr Rank's place will now be taken by Dr S. Radó of Berlin. He will be supported as advisers and collaborators by Dr M. Eitingon (Berlin) and Dr S. Ferenczi (Budapest). All communications and contributions for the editor should be addressed to Dr Sándor Radó, Berlin-Schöneberg, Am Park, 20. The business side of the *Zeitschrift* will be conducted as before at the offices of the Internationaler Psychoanalytischer Verlag in Vienna (Manager: A. J. Storfer).

1 ['Mitteilung des Herausgebers' ('Announcement by the Director'), *Int. Z. Psychoan.*, **10** (1924), 373. It was reprinted in *GW*, **Nachtr.** (1987), 713. The present translation by James Strachey is reprinted from *SE*, **19** (1961), 293.]

BIBLIOGRAPHY

[Titles of books and periodicals are in italics; titles of papers are in inverted commas. Abbreviations are in accordance with the *World List of Scientific Periodicals* (London, 1963–5). Further abbreviations used in this volume can be found in the List at the end of this bibliography. Numerals in bold type refer to volumes; ordinary numerals refer to pages. In the case of the Freud entries, the letters attached to the dates of publication are in accordance with the corresponding entries in the complete bibliography of Freud's writings in the last volume of the *Revised Standard Edition*.

Freud with his father Jakob in 1866

Freud with his father Jakob in 1866

'He told me a story to show me how much better things were now than they had been in his days. "When I was a young man", he said, "I went for a walk one Saturday in the streets of your birthplace; I was well dressed, and had a new fur cap on my head. A Christian came up to me and with a single blow knocked off my cap into the mud and shouted: 'Jew! get off the pavement!'" "And what did you do?" I asked. "I went into the roadway and picked up my cap," was his quiet reply. This struck me as unheroic conduct on the part of the big, strong man who was holding the little boy by the hand."' (*RSE*, **4**, 174.)

NOTE ON THE REVISED TRANSLATION

The translations in this *Revised Standard Edition* are supplemented by four sets of notes:

(1) Lengthy commentaries on the English renditions of technical terms that are considered controversial are provided in Volume 24. Usually at the first appearance of each such technical term in each text, but sometimes in other places where the issue seems relevant, the original German word is interpolated in square brackets and a superscript upper-case [T] indicates that the term is discussed in the 24th volume. There (on pp. 55–99) the commentaries appear, in alphabetical order, under the heading 'Notes on the Translation of Some Technical Terms'. If the technical term appears in a derivate form in the text, the root word (as it appears in Volume 24) is provided in the margin. For example, if the interpolated word is the derivative [*überträgt*], the root technical term *Übertragung* appears in the margin.

(2) Shorter commentaries on the English rendition of specific words or phrases appearing in particular places (as opposed to general technical terms) that have attracted comment in the secondary literature are also provided in Volume 24. These minor commentaries are distinguished from those concerning general technical terms by the use of a superscript lower-case [t] in the place where the controversial translation appears. The corresponding set of annotations appears on pp. 105–33 of Volume 24, in chronological order, under the heading 'Annotations to Individual Translations'.

(3) Further interpolations in the translations of German words in square brackets are provided *ad hoc*, without superscript letters, for reasons that should be self-explanatory in each instance. For example, if a technical term which was referenced and discussed in a Note in Volume 24 appears again shortly afterwards in a way that illuminates the points discussed there, then it is silently referenced again. Some of these interpolations might seem odd to German-speaking readers, since no attempt is made to 'adjust' Freud's grammar to conform with the English translation (see the Preface to the Revised Edition, *RSE*, **1**, xxvi *n*. 1). The words in square brackets interpolated in the text are always exactly what Freud wrote.

(4) In a good few places, commentaries (of both types 1 and 2) are also provided in the Editors' introductory notes, appendices and footnotes to the text itself. These are indexed in Volume 24, on pp. 601–6, under the heading 'Notes on Terms and Their Uses'. Such commentaries are usually reserved for matters of translation that are likely to be of interest or value to the general reader, as opposed to those with a special interest in such technical matters.

The pagination of the original *Standard Edition* is provided also in the margins, in square brackets, to assist cross-referencing.

For the reasons explained in the 'Preface to the Revised Edition' (*RSE*, **1**, xxix), all differences between the *SE* and *RSE* are identified through light underscoring of the text. This device was considered necessary to make readers aware of the subtle and pervasive revisions of the translations. The same applies to the revisions of the editorial apparatus. This underscoring will hopefully be removed in later editions of the *RSE*, once the revised edition has become established as the canonical one.

The overarching policy here has been to underscore all differences between the *SE* and *RSE*, with minimal exceptions, in order to ensure transparency. The three categories of exceptions (i.e. the differences that are *not* underscored) are (a) changes that are purely typographical and/or absolutely stereotyped across Volumes 1–23, (b) changes in the location of Freud texts within or between volumes, and (c) all the changes to Volume 24.

The rationale behind (a) is that we wanted to avoid any subjective judgements by the Editor of the *RSE* as to what is and what is not 'significant'. For example, some but not all readers might consider alterations to Strachey's spelling, grammar and punctuation to be trivial, but the potential significance – however subtle – varies with context. The rationale behind (b) is that these changes are indicated in the 'List of Relocated Freud Material in the Revised Edition', which is provided in Volume 24. These changes are also mentioned in the revised (and therefore underscored) editorial notes to the texts themselves. The rationale behind (c) is that the *RSE* version of Volume 24 is so utterly different from the *SE* version that readers can safely consider the volume as a whole to be new.

The following changes were deemed purely typographical and absolutely stereotyped, and are therefore exempted from underscoring:

(1) Changes in type-size, font and spacing (since they are objectively insignificant).

(2) The marginalia – including page numbers – and the superscript ^{T}s and ^{t}s (since they always represent changes).

(3) Changed page numbers in the cross-references and indexes (this follows logically from point 2).

(4) Altered footnote numbers (since new footnotes are always identified by the fact that the notes themselves are underscored, and the knock-on effects for numbering are objectively insignificant).

(5) Changes in running headings (since they repetitively echo changes that are underscored in the main body of text).

(6) Change from the singular possessive 'Editor's' to the plural 'Editors'' (since this applies throughout and follows logically from the fact that, unlike the *SE*, the *RSE* has two editors). In the few instances where the Editor is referred to in the singular, it is always clear from the context whether this means Strachey or Solms or, in the case of Freud (1985*a* [1915]), Grubrich-Simitis.

(7) This preliminary 'Note on the Revised Translation' (since it is obviously added; it applies only to the *RSE*).

(8) Captions to the illustrations (since they always represent changes).

(9) Changes in editorial style (since they are stereotyped and therefore need only be identified once, namely here):

- The word 'and' in two-author citations becomes '&', and a comma is inserted between author name/s and the publication date (e.g. Freud & Breuer, 1895*d*).
- Abbreviations of months (e.g. 'Oct.') and chapters ('Chap.') are spelt out ('October', 'Chapter').
- '*The*' is added to all editorial references to '*Interpretation of Dreams*'.
- Title abbreviations conform to modern usage (e.g. *G.W.* becomes *GW*).
- Punctuation is positioned inside closing quotation marks (e.g. 'The Latin word slipped your memory.').

(10) Modernized hyphenation of words is underscored, but not for those terms that occur very repetitively in the text (since they are stereotyped and the list is limited enough for readers to memorize). Here is the list, which implies also the plural and other grammatical forms of these terms:

anxiety-dream	*becomes*	anxiety dream
anxiety-hysteria	*becomes*	anxiety hysteria
day-dream	*becomes*	daydream
death-wish	*becomes*	death wish
dream-content	*becomes*	dream content
dream-interpretation	*becomes*	dream interpretation
dream-thought	*becomes*	dream thought
ego-cathexis	*becomes*	ego cathexis
ego-libido	*becomes*	ego libido
love-object	*becomes*	love object
object-cathexis	*becomes*	object cathexis
object-choice	*becomes*	object choice
object-libido	*becomes*	object libido
object-love	*becomes*	object love
object-presentation	*becomes*	object presentation
object-relation	*becomes*	object relation
psycho-analysis	*becomes*	psychoanalysis
sound-presentation	*becomes*	sound presentation
super-ego	*becomes*	superego
thing-presentation	*becomes*	thing presentation
to-day	*becomes*	today
wish-fulfilment	*becomes*	wish fulfilment
word-presentation	*becomes*	word presentation

An Autobiographical Study

(1925 [1924])

EDITORS' NOTE

SELBSTDARSTELLUNG

GERMAN EDITIONS

1925 In Grote's *Die Medizin der Gegenwart in Selbstdarstellungen*, **4**, 1–52. [3]
(Leipzig: Meiner.)
1928 *GS*, **11**, 119–82.
1934 In book form, under title *Selbstdarstellung*. Leipzig, Vienna and Zürich:
Internationaler Psychoanalytischer Verlag. Pp. 52.
1936 2nd ed. Vienna: Internationaler Psychoanalytischer Verlag. Pp. 107. With
new footnotes and other additional matter and including 'Nachschrift 1935'
(see below).
1946 London: Imago Publishing Co. Reprint of above with different illustrations.
Pp. 107.
1948 *GW*, **14**, 33–96. With the new footnotes from 2nd ed., but without the other
additional matter. (For 'Nachschrift 1935' see below.)

1935 'Nachschrift 1935.' *Almanach 1936*, 9–14.
1936 In *Selbstdarstellung*, 2nd ed. (see above), 102–7.
1946 In the London reprint of above.
1950 *GW*, **16**, 31–4.

ENGLISH TRANSLATIONS

An Autobiographical Study

1927 In *The Problem of Lay-Analyses*, New York: Brentano, 189–316.
(Tr. James Strachey.)
1935 London: Hogarth Press and Institute of Psycho-Analysis. Pp. 137. Same
translation, revised from 2nd German ed., with new footnotes and other
additional matter, and including 'Postscript (1935)'.

Autobiography

1935 New York: Norton. Pp. 153. Same as above, but with different title.
1959 *SE*, **20**, 7–70. (Tr. James Strachey, modified version of the 1935 translation,
including 'Postscript (1935)', reverting to previous title.)
1986 *PFL*, **15**, 185–259. (Reprint of the *SE* translation.)

[4] The present translation is a slightly revised and corrected reprint of the *SE* version.

The original (1925) German edition of this work included a substantial bibliography of Freud's works up to 1923, with brief introductory and concluding notes. The bibliography was not reprinted in any of the subsequent editions. The introductory and concluding notes are included in the present edition, however, in the form of an Appendix.

As Freud explains in his 1935 'Postscript' (p. 63 below), the English translation of this work, when it was first published in America in 1927, was included in the same volume as his discussion of 'lay analysis'; but the *Autobiographical Study* was not mentioned either on the title page or on the outer cover of the book. When the work was taken over by a new American publisher eight years later, he suggested to Freud that it should be revised and brought up to date. Thus the new material appeared in English before its publication in German. Volume 11 of the *Gesammelte Schriften*, published in 1928, of course only gives the text of the first edition. Volume 14 of the *Gesammelte Werke*, published in 1948, gives a photographic reproduction of that version, together with the new footnotes which had been added in the second edition. Unfortunately, however, the fact was overlooked that a considerable number of changes and additions had been made in the actual *text* of the work. These were consequently not initially included in the *Gesammelte Werke*, though they were added in the supplementary volume to the *GW* (**Nachtr.**, 1987). They can also naturally be found in the editions of the book issued separately (1936 and 1946). These revisions are noted in the English translation below. We learn from Grubrich-Simitis (1993) that Freud began writing this work in July, 1924, and Jones (1957, 123) tells us that the main work was written in August and September, and actually appeared in February, 1925; the 'Postscript' was completed by May, 1935.

This work is commonly, and quite misleadingly, referred to as Freud's 'Autobiography'. The title of the series to which it was originally contributed – *Die Medizin der Gegenwart in Selbstdarstellungen* (which might be translated 'Contemporary Medicine in Self-Portrayals') – shows clearly enough that the aim of its editors (it was published in eight volumes, 1923–9, with contributions from numerous leading medical authorities) was to present an account of the recent history of medical science from the pens of those who had played a chief part in making it. Thus Freud's study is essentially an account of his personal share in the *development of psychoanalysis*. As he himself points out in the opening paragraph, he was inevit-
[5] ably going over much of the ground which he had already traversed in his paper 'On the History of the Psychoanalytic Movement' (1914*d*), *RSE*, **14**, some ten years before. Nevertheless, as a comparison between the two works will show, his present mood was a very different one. The controversies that embittered the earlier paper had now faded into insignificance and he was able to give a cool and entirely objective account of the evolution of his scientific views.

Those who wish for the story of his *personal* life must once more be referred to the three volumes of Ernest Jones's biography.

AN AUTOBIOGRAPHICAL STUDY

I

Several of the contributors to this series of 'Autobiographical Studies' have begun by expressing their misgivings at the unusual difficulties of the task they have undertaken. The difficulties in my case are, I think, even greater; for I have already more than once published papers upon the same lines as the present one, papers which, from the nature of the subject, have dealt more with personal considerations than is usual or than would otherwise have been necessary. [7]

I gave my first account of the development and subject matter of psychoanalysis in five lectures which I delivered in 1909 before Clark University at Worcester, Mass., where I had been invited to attend the celebration of the twentieth anniversary of the foundation of that body.[1] Only recently I gave way to the temptation of making a contribution of a similar kind to an American collective publication dealing with the opening years of the twentieth century, since its editors had shown their recognition of the importance of psychoanalysis by allotting a special chapter to it.[2] Between these two dates appeared a paper, 'On the History of the Psychoanalytic Movement' [1914*d*], which, in fact, contains the essence of all that I can say on the present occasion. Since I must not contradict myself and since I have no wish to repeat myself exactly, I must endeavour to construct a narrative in which subjective and objective attitudes, biographical and historical interests, are combined in a new proportion.[3]

I was born on May 6, 1856, at Freiberg in Moravia, a small town in what is now Czechoslovakia. My parents were Jews, and I have remained a

1 The lectures were first published (in English) in the *American Journal of Psychology* (1910); the original German was issued under the title of *Über Psychoanalyse* [1910*a*; *RSE*, **11**].

2 *These Eventful Years* (New York, 1924). My essay, translated by Dr A. A. Brill, forms chapter lxxiii of the second volume [1924*f*; *RSE*, **19**].

3 [In the 1925, 1928 and 1948 editions the rest of this chapter was printed in small type.]

[8] Jew myself. I have reason to believe that my father's family were settled for a long time on the Rhine (at Cologne), that, as a result of a persecution of the Jews during the fourteenth or fifteenth century, they fled eastwards, and that, in the course of the nineteenth century, they migrated back from Lithuania through Galicia into German Austria. When I was a child of four I came to Vienna, and I went through the whole of my education there. At the 'Gymnasium' [grammar school][1] I was at the top of my class for seven years; I enjoyed special privileges there, and had scarcely ever to be examined in class. Although we lived in very limited circumstances, my father insisted that, in my choice of a profession, I should follow my own inclinations alone. Neither at that time, nor indeed in my later life, did I feel any particular predilection for the career of a doctor.[2] I was moved, rather, by a sort of curiosity, which was, however, directed more towards human concerns than towards natural objects; nor had I grasped the importance of observation as one of the best means of gratifying it. My deep engrossment in the Bible story[3] (almost as soon as I had learnt the art of reading) had, as I recognized much later, an enduring effect upon the direction of my interest. Under the powerful influence of a school friendship with a boy rather my senior who grew up to be a well-known politician,[4] I developed a wish to study law like him and to engage in social activities. At the same time, the theories of Darwin, which were then of topical interest, strongly attracted me, for they held out hopes of an extraordinary advance in our understanding of the world; and it was hearing Goethe's beautiful essay on Nature read aloud at a popular lecture by Professor Carl Brühl[5] just before I left school that decided me to become a medical student.

[9] When, in 1873, I first joined the university, I experienced some appreciable disappointments. Above all, I found that I was expected to feel myself inferior and an alien because I was a Jew. I refused absolutely to do the first of these things. I have never been able to see why I should

1 [The so-called 'Sperlgymnasium'. Cf. 'Some Reflections on Schoolboy Psychology' (1914*f*), *RSE*, **13**, 233.]

2 [This is enlarged upon in Freud's Postscript to *The Question of Lay Analysis* (1927*a*), below, p. 226 f.]

3 [This sentence and the following one were added in 1935.]

4 [This was Heinrich Braun (1854–1927), a leading figure in the social-democratic movement.]

5 [This name was inserted in 1935. – According to Pestalozzi (1956) the real author of the essay (written in 1780) was G. C. Tobler, a Swiss writer. Goethe came across it half a century later, and, by a paramnesia, included it among his own works. – The essay, 'Fragment über die Natur', figures in one of Freud's dreams (*RSE*, **5**, 393–4). – It is said that Freud wrote a review of the lecture for a Vienna newspaper; but this has not been traced. See Jones, 1953, 31 *n*.]

feel ashamed of my descent or, as people were beginning to say, of my 'race'. I put up, without much regret, with my non-acceptance into the community; for it seemed to me that in spite of this exclusion an active fellow worker could not fail to find some nook or cranny in the framework of humanity. These first impressions at the university, however, had one consequence which was afterwards to prove important; for at an early age I was made familiar with the fate of being in the Opposition and of being put under the ban of the 'compact majority'.[1] The foundations were thus laid for a certain degree of independence of judgement.

I was compelled, moreover, during my first years at the university, to make the discovery that the peculiarities and limitations of my gifts denied me all success in many of the departments of science into which my youthful eagerness had plunged me. Thus I learnt the truth of Mephistopheles' warning:

> Vergebens, dass ihr ringsum wissenschaftlich schweift,
> Ein jeder lernt nur, was er lernen kann.[2]

At length, in Ernst Brücke's[3] physiological laboratory, I found rest and full satisfaction – and men, too, whom I could respect and take as my models: the great Brücke himself, and his assistants, Sigmund Exner[4] and Ernst Fleischl von Marxow.[5] With the last of these, a brilliant man, [10]
I was privileged to be upon terms of friendship.[6] Brücke gave me a problem to work out in the histology of the nervous system; I succeeded in solving it to his satisfaction and in carrying the work further on my own account. I worked at this Institute, with short interruptions, from 1876 to 1882, and it was generally thought that I was marked out to fill the next post of Assistant that might fall vacant there.[7] The various branches of medicine proper, apart from psychiatry, had no attraction for me. I was decidedly negligent in pursuing my medical studies, and it was not until 1881 that I took my somewhat belated degree as a Doctor of Medicine.

1 [The reference is to Ibsen's *Enemy of the People*. Cf. below, p. 260.]

2 ['It is in vain that you range around from science to science: each man learns only what he can learn.' – Goethe, *Faust*, Part I, Scene 4.]

3 [Ernst Wilhelm von Brücke (1819–92), Professor of Physiology.]

4 [Sigmund Exner (1846–1926) succeeded Brücke as Professor of Physiology.]

5 [Ernst Fleischl von Marxow (1840–91) was distinguished both as physicist and physiologist.]

6 [This sentence and the last clause of the preceding one were added in 1935.]

7 [There are many references to this period in *The Interpretation of Dreams* (1900*a*). See, in particular, *RSE*, **5**, 429 ff.]

The turning point came in 1882, when my teacher, for whom I felt the highest possible esteem, corrected my father's generous improvidence by strongly advising me, in view of my bad financial position, to abandon my theoretical career. I followed his advice, left the physiological laboratory and entered the General Hospital as an *Aspirant* [clinical assistant]. I was soon afterwards promoted to being a *Sekundararzt* [junior or house physician], and worked in various departments of the hospital, among others for more than six months under Meynert,[1] by whose work and personality I had been greatly struck while I was still a student.

In a certain sense I nevertheless remained faithful to the line of work upon which I had originally started. The subject which Brücke had proposed for my investigations had been the spinal cord of one of the lowest of the fishes (*Ammocoetes Petromyzon*);[2] and I now passed on to the human central nervous system. Just at this time Flechsig's[3] discoveries of the non-simultaneity of the formation of the myelin sheaths were throwing a revealing light upon the intricate course of its tracts. The fact that I began by choosing the medulla oblongata as the one and only
[11] subject of my work was another sign of the continuity of my development. In complete contrast to the diffuse character of my studies during my earlier years at the university, I was now developing an inclination to concentrate my work exclusively upon a single subject or problem. This inclination has persisted and has since led to my being accused of one-sidedness.

I now became as active a worker in the Institute of Cerebral Anatomy as I had previously been in the physiological one. Some short papers upon the course of the tracts and the origins of nuclei in the medulla oblongata[4] date from these hospital years, and some notice was taken of my findings by Edinger.[5] One day Meynert, who had given me access to the laboratory even during the times when I was not actually working under him, proposed that I should definitely devote myself to the anatomy of the brain, and promised to hand over his lecturing work to me, as he felt he was too old to manage the newer methods. This I declined, in alarm at the magnitude of the task; it is possible, too, that I had

1 [Theodor Meynert (1833–92), Professor of Psychiatry.]

2 [The larval form of the brook lamprey. Freud, 1877*a* and 1878*a*, included in *NSW*, **1**. Cf. also *RSE*, **3**, 231.]

3 [Paul Flechsig (1847–1929), Professor of Psychiatry in Leipzig.]

4 [Freud, 1885*d*, 1886*b* and 1886*c*, included in *NSW*, **1**.]

5 [Ludwig Edinger (1855–1918), Professor of Neuroanatomy in Berlin.]

guessed already that this great man was by no means kindly disposed towards me.

From the material point of view, brain anatomy was certainly no better than physiology, and, with an eye to pecuniary considerations, I began to study nervous diseases. There were, at that time, few specialists in that branch of medicine in Vienna, the material for its study was distributed over a number of different departments of the hospital, there was no satisfactory opportunity of learning the subject, and one was forced to be one's own teacher. Even Nothnagel,[1] who had been appointed a short time before, on account of his book upon cerebral localization,[2] did not single out neuropathology from among the other subdivisions of medicine. In the distance shone the great name of Charcot;[3] so I formed a plan of first obtaining an appointment as University Lecturer [*Dozent*] on Nervous Diseases in Vienna and of then going to Paris to continue my studies.

In the course of the following years, while I continued to work as a [12] junior physician, I published a number of clinical observations on organic diseases of the nervous system. I gradually became familiar with the ground; I was able to localize the site of a lesion in the medulla oblongata so accurately that the pathological anatomist had no further information to add; I was the first person in Vienna to send a case for autopsy with a diagnosis of polyneuritis acuta.[4]

The fame of my diagnoses and of their post-mortem confirmation brought me an influx of American physicians, to whom I lectured upon the patients in my department in a sort of pidgin English. About the neuroses I understood nothing. On one occasion I introduced to my audience a neurotic suffering from a persistent headache as a case of chronic localized meningitis; they all quite rightly rose in revolt and deserted me, and my premature activities as a teacher came to an end. By way of excuse I may add that this happened at a time when greater authorities than myself in Vienna were in the habit of diagnosing neurasthenia as cerebral tumour.

In the spring of 1885 I was appointed Lecturer in Neuropathology on the ground of my histological and clinical publications. Soon afterwards, as the result of a warm testimonial from Brücke, I was awarded a

4 [Freud, 1886*a*, included in *NSW*, **1**.]

Travelling Bursary of considerable value.[1] In the autumn of the same year I made the journey to Paris.

I became a student [*élève*] at the Salpêtrière, but, as one of the crowd of foreign visitors, I had little attention paid me to begin with. One day in my hearing Charcot expressed his regret that since the war he had heard nothing from the German translator of his lectures; he went on to say that he would be glad if someone would undertake to translate the new volume of his lectures into German. I wrote to him and offered to do so; I can still remember a phrase in the letter, to the effect that I suffered only from '*l'aphasie motrice*' and not from '*l'aphasie sensorielle du français*'. Charcot accepted the offer, I was admitted to the circle of his personal acquaintances, and from that time forward I took a full part in all that went on at the Clinic.

[13] As I write these lines, a number of papers and newspaper articles have reached me from France, which give evidence of a violent objection to the acceptance of psychoanalysis, and which often make the most inaccurate assertions in regard to my relations with the French school. I read, for instance, that I made use of my visit to Paris to familiarize myself with the theories of Pierre Janet and then made off with my booty. I should therefore like to say explicitly that during the whole of my visit to the Salpêtrière Janet's name was never so much as mentioned.

What impressed me most of all while I was with Charcot were his latest investigations upon hysteria, some of which were carried out under my own eyes. He had proved, for instance, the genuineness of hysterical phenomena and their conformity to laws ('*introite et hic dii sunt*'),[2] the frequent occurrence of hysteria in men, the production of hysterical paralyses and contractures by hypnotic suggestion and the fact that such artificial products showed, down to their smallest details, the same features as spontaneous attacks, which were often brought on traumatically. Many of Charcot's demonstrations began by provoking in me and in other visitors a sense of astonishment and an inclination to scepticism, which we tried to justify by an appeal to one of the theories of the day. He was always friendly and patient in dealing with such doubts, but he was also most decided; it was in one of these discussions

1 [The amount was 600 florins. Freud's official report on his visits to Paris and Berlin is available (Freud, 1956*a* [1886]; *NSW*, **4**; *RSE*, **1**, 5 ff.).]

2 [In a letter to Fliess of December 4, 1896 (Freud, 1950*a*, Letter 51), Freud quoted these words as a 'proud motto' for a chapter on the psychology of hysteria in a book that he was planning (but never wrote). The phrase is more usually quoted as: '*Introite, nam et hic dii sunt*'. ('Enter, for here too are gods.') It was used by Lessing as a motto for his play *Nathan der Weise*. Aristotle, in *De partib. animal.*, I, 5, attributes it in its Greek form to Heraclitus.]

that (speaking of theory) he remarked, '*Ça n'empêche pas d'exister*', a *mot* which left an indelible mark upon my mind.[1]

No doubt not the whole of what Charcot taught us at that time holds good today: some of it has become doubtful, some has definitely failed to withstand the test of time. But enough is left over that has found a permanent place in the storehouse of science. Before leaving Paris I discussed with the great man a plan for a comparative study of hysterical [14]
and organic paralyses. I wished to establish the thesis that in hysteria paralyses and anaesthesias of the various parts of the body are demarcated according to the popular idea of their limits and not according to anatomical facts. He agreed with this view, but it was easy to see that in reality he took no special interest in penetrating more deeply into the psychology of the neuroses.[2] When all is said and done, it was from pathological anatomy that his work had started.

Before I returned to Vienna I stopped for a few weeks in Berlin, in order to gain a little knowledge of the general disorders of childhood. Kassowitz,[3] who was at the head of a public institute in Vienna for the treatment of children's diseases, had promised to put me in charge of a department for the nervous diseases of children. In Berlin I was given assistance and a friendly reception by Baginsky.[4] In the course of the next few years I published, from the Kassowitz Institute, several monographs of considerable size on unilateral and bilateral cerebral palsies in children.[5] And for that reason, at a later date (in 1897), Nothnagel made me responsible for dealing with the same subject in his great *Handbuch der allgemeinen und speziellen Therapie*.[6]

In the autumn of 1886 I settled down in Vienna as a physician, and married the girl who had been waiting for me in a distant city for more than four years. I may here go back a little and explain how it was the fault of my fiancée that I was not already famous at that youthful age.[7] A side interest, though it was a deep one, had led me in 1884 to obtain

1 [A footnote by Freud to one of his translations of Charcot (Freud, 1892–94*a*; *RSE*, **1**, 167) shows that this remark was addressed to him himself.]

2 [Some seven years later Freud published his paper on the subject, in French (1893*c*), *NSW*, **4**; *RSE*, **1**, 187 ff.]

3 [Max Kassowitz (1842–1913), a Vienna paediatrician.]

4 [Adolf Baginsky (1843–1918) was the editor of a paediatric journal to which Freud contributed neurological abstracts, included in *NSW*.]

5 [Freud, 1891*a* and 1893*b*, included in *NSW*, **2**.]

7 [This episode is discussed at length in Chapter VI of Jones, 1953. Freud's cocaine papers are included in *NSW*, **1**.]

from Merck[1] some of what was then the little-known alkaloid cocaine and to study its physiological action. While I was in the middle of this work, an opportunity arose for making a journey to visit my fiancée, from whom I had been parted for two years. I hastily wound up
[15] my investigation of cocaine and contented myself in my monograph on the subject [1884*e*; *NSW*, **1**] with prophesying that further uses for it would soon be found. I suggested, however, to my friend Königstein,[2] the ophthalmologist, that he should investigate the question of how far the anaesthetizing properties of cocaine were applicable in diseases of the eye. When I returned from my holiday I found that not he, but another of my friends, Carl Koller[3] (now in New York), whom I had also spoken to about cocaine, had made the decisive experiments upon animals' eyes and had demonstrated them at the Ophthalmological Congress at Heidelberg. Koller is therefore rightly regarded as the discoverer of local anaesthesia by cocaine, which has become so important in minor surgery; but I bore my fiancée no grudge for the interruption.[4]

I will now return to the year 1886, the time of my settling down in Vienna as a specialist in nervous diseases. The duty devolved upon me of giving a report before the 'Gesellschaft der Ärzte' [Society of Medicine] upon what I had seen and learnt with Charcot. But I met with a bad reception. Persons of authority, such as the chairman (Bamberger, the physician), declared that what I said was incredible. Meynert challenged me to find some cases in Vienna similar to those which I had described and to present them before the Society. I tried to do so; but the senior physicians in whose departments I found any such cases refused to allow me to observe them or to work at them. One of them, an old surgeon, actually broke out with the exclamation: 'But, my dear sir, how can you talk such nonsense? *Hysteron* (*sic*) means the uterus. So how can a man be hysterical?' I objected in vain that what I wanted was not to have my diagnosis approved, but to have the case put at my disposal. At length, outside the hospital, I came upon a case of classical hysterical hemianaesthesia in a man, and demonstrated it before the 'Gesellschaft der Ärzte' [1886*d*; *NSW*, **4**]. This time I was applauded, but

1 A chemical firm in Darmstadt.

2 [Leopold Königstein (1850–1924), Professor of Ophthalmology, was a lifelong friend of Freud's.]

3 [Then a house surgeon at the Vienna General Hospital.]

4 [In 1924 this read '*mein damaliges Versäumnis* (my omission at the time)'. This was changed in 1935 to '*die damalige Störung* (the interruption at the time)'. This change was not made in the 1948 edition.]

no further interest was taken in me. The impression that the high authorities had rejected my innovations remained unshaken; and, with my hysteria in men and my production of hysterical paralyses by sug- [16] gestion, I found myself forced into the Opposition. As I was soon afterwards excluded from the laboratory of cerebral anatomy[1] and for terms on end had nowhere to deliver my lectures, I withdrew from academic life and ceased to attend the learned societies. It is a whole generation since I have visited the 'Gesellschaft der Ärzte'.

Anyone who wants to make a living from the treatment of nervous patients must clearly be able to do something to help them. My therapeutic arsenal contained only two weapons, electrotherapy and hypnotism, for prescribing a visit to a hydropathic establishment after a single consultation was an inadequate source of income. My knowledge of electrotherapy was derived from W. Erb's textbook [1882], which provided detailed instructions for the treatment of all the symptoms of nervous diseases. Unluckily I was soon driven to see that following these instructions was of no help whatever and that what I had taken for an epitome of exact observations was merely the construction of phantasy. The realization that the work of the greatest name in German neuropathology had no more relation to reality than some 'Egyptian' dream book, such as is sold in cheap bookshops, was painful, but it helped to rid me of another shred of the innocent faith in authority from which I was not yet free. So I put my electrical apparatus aside, even before Moebius[2] had saved the situation by explaining that the successes of electric treatment in nervous disorders (insofar as there were any) were the effect of suggestion on the part of the physician.

With hypnotism the case was better. While I was still a student I had attended a public exhibition given by Hansen the 'magnetist',[3] and had noticed that one of the experimental subjects had become deathly pale at the onset of cataleptic rigidity and had remained so as long as that condition lasted. This firmly convinced me of the genuineness of the phenomena of hypnosis. Scientific support was soon afterwards given to this view by Heidenhain;[4] but that did not restrain the professors of [17]

1 [Freud's relations with Meynert are discussed among the associations to one of his dreams in *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 390–1. Cf. also ibid., **4**, 148.]

2 [Paul Moebius (1853–1907), Professor of Neuropathology in Leipzig.]

3 [See ibid., **1**, 66 *n*. 1.]

4 [Rudolf Heidenhain (1834–97), Professor of Physiology and Histology in Breslau.]

psychiatry from declaring for a long time to come that hypnotism was not only fraudulent but dangerous and from regarding hypnotists with contempt. In Paris I had seen hypnotism used freely as a method for producing symptoms in patients and then removing them again. And now the news reached us that a school had arisen at Nancy which made an extensive and remarkably successful use of suggestion, with or without hypnosis, for therapeutic purposes. It thus came about, as a matter of course, that in the first years of my activity as a physician my principal instrument of work, apart from haphazard and unsystematic psychotherapeutic methods, was hypnotic suggestion.

This implied, of course, that I abandoned the treatment of organic nervous diseases; but that was of little importance. For on the one hand the prospects in the treatment of such disorders were in any case never promising, while, on the other hand, in the private practice of a physician working in a large town, the quantity of such patients was nothing compared to the crowds of neurotics, whose number seemed further multiplied by the way in which they hurried, with their troubles unsolved, from one physician to another. And, apart from this, there was something positively seductive in working with hypnotism. For the first time there was a sense of having overcome one's helplessness; and it was highly flattering to enjoy the reputation of being a miracle-worker. It was not until later that I was to discover the drawbacks of the procedure. At the moment there were only two points to complain of: first, that I could not succeed in hypnotizing every patient, and secondly, that I was unable to put individual patients into as deep a state of hypnosis as I should have wished. With the idea of perfecting my hypnotic technique, I made a journey to Nancy in the summer of 1889 and spent several weeks there. I witnessed the moving spectacle of old Liébeault working among the poor women and children of the labouring classes. I was a spectator of Bernheim's astonishing experiments upon his hospital patients, and I received the profoundest impression of the possibility that there could be powerful mental [*seelischer*][T] processes which nevertheless remained hidden from the consciousness of men. Thinking it would be instructive, I had persuaded one of my patients to follow me to Nancy. This patient was a very highly gifted hysteric, a woman of good birth, who had been handed over to me because no-one knew what to do with her. By hypnotic influence I had made it possible for her to lead a tolerable existence and I was always able to take her out of the misery of her condition. But she always relapsed again after a short time, and in my ignorance I attributed this to the fact that her

Seele

[18]

hypnosis had never reached the stage of somnambulism with amnesia. Bernheim now attempted several times to bring this about, but he too failed. He frankly admitted to me that his great therapeutic successes by means of suggestion were achieved only in his hospital practice and not with his private patients. I had many stimulating conversations with him, and undertook to translate into German his two works upon suggestion and its therapeutic effects.[1]

During the period from 1886 to 1891 I did little scientific work, and published scarcely anything. I was occupied with establishing myself in my new profession and with assuring my own material existence as well as that of a rapidly increasing family. In 1891 there appeared the first of my studies on the cerebral palsies of children, which was written in collaboration with my friend and assistant, Dr Oskar Rie.[2] An invitation which I received in the same year to contribute to an encyclopaedia of medicine[3] led me to investigate the theory of aphasia. This was at the time dominated by the views of Wernicke and Lichtheim, which laid stress exclusively upon localization. The fruit of this enquiry was a small critical and speculative book, *Zur Auffassung der Aphasien* [1891*b*; *NSW*, **4**].

But I must now show how it happened that scientific research once more became the chief interest of my life.

1 [This must be a mistake, since the first of Freud's translations of Bernheim was published *before* his visit to Nancy (Freud, 1888–89*a*). The second appeared in 1892.]

2 [See above, p. 11 and *n*. 5.]

3 [The first volume of Villaret's *Handwörterbuch*, to which Freud contributed some unsigned and not certainly identifiable articles, was in fact published in 1888. The second volume appeared in 1891, but the article on aphasia was in the first volume (1888*b*). The articles most likely attributable to Freud are included in *NSW*, **4**, as is the (1891*b*) book mentioned a few lines down.]

II

[19] I must supplement what I have just said by explaining that from the very first I made use of hypnosis in *another* manner, apart from hypnotic suggestion. I used it for questioning the patient upon the origin of his symptom, which in his waking state he could often describe only very imperfectly or not at all. Not only did this method seem more effective than mere suggestive commands or prohibitions, but it also satisfied the curiosity of the physician, who, after all, had a right to learn something of the origin of the phenomenon which he was striving to remove by the monotonous procedure of suggestion.

The manner in which I arrived at this other procedure was as follows. While I was still working in Brücke's laboratory I had made the acquaintance of Dr Josef Breuer,[1] who was one of the most respected family physicians in Vienna, but who also had a scientific past, since he had produced several works of permanent value upon the physiology of respiration and upon the organ of equilibrium. He was a man of striking intelligence and fourteen years older than myself. Our relations soon became more intimate and he became my friend and helper in my difficult circumstances. We grew accustomed to share all our scientific interests with each other. In this relationship the gain was naturally mine. The development of psychoanalysis afterwards cost me his friendship. It was not easy for me to pay such a price, but I could not escape it.

Even before I went to Paris, Breuer had told me about a case of hysteria which, between 1880 and 1882, he had treated in a peculiar manner which had allowed him to penetrate deeply into the causation and significance of hysterical symptoms. This was at a time, therefore, when Janet's works still belonged to the future. He repeatedly read me pieces of the case history, and I had an impression that it accomplished more towards an understanding of neuroses than any previous observation. I determined to inform Charcot of these discoveries when I reached Paris, and I actually did so. But the great
[20] man showed no interest in my first outline of the subject, so that I never returned to it and allowed it to pass from my mind.

When I was back in Vienna I turned once more to Breuer's

1 [1842–1925. Freud wrote more fully about him on the occasion of his death very shortly after the publication of the present work (1925*g*), *RSE*, **19**, 287.]

observation and made him tell me more about it. The patient had been a young girl of unusual education and gifts, who had fallen ill while she was nursing her father, of whom she was devotedly fond. When Breuer took over her case it presented a variegated picture of paralyses with contractures, inhibitions [*Hemmungen*][T] and states of mental confusion. A chance observation showed her physician that she could be relieved of these clouded states of consciousness if she was induced to express in words the affective phantasy [*Phantasie*] by which she was at the moment dominated. From this discovery, Breuer arrived at a new method of treatment. He put her into deep hypnosis and made her tell him each time what it was that was oppressing her mind. After the attacks of depressive confusion had been overcome in this way, he employed the same procedure for removing her inhibitions and physical disorders. In her waking state the girl could no more describe than other patients how her symptoms had arisen, and she could discover no link between them and any experiences of her life. In hypnosis she immediately discovered the missing connection. It turned out that all her symptoms went back to moving events which she had experienced while nursing her father; that is to say, her symptoms had a meaning and were residues or reminiscences of those emotional situations. It was found in most instances that there had been some thought or impulse which she had had to suppress while she was by her father's sick-bed, and that, in place of it, as a substitute for it, the symptom had afterwards appeared. But as a rule the symptom was not the precipitate of a single such 'traumatic' scene, but the result of a summation of a number of similar situations. When the patient recalled a situation of this kind in a hallucinatory way under hypnosis and belatedly[1] [*nachträglich*] carried through to its conclusion, with a free expression of emotion, the mental act which she had originally suppressed, the symptom was abolished and did not return. By this procedure Breuer succeeded, after long and painful efforts, in relieving his patient of all her symptoms.

The patient had recovered and had remained well and, in fact, had become capable of doing serious work. But over the final stage of this [21]
hypnotic treatment there rested a veil of obscurity, which Breuer never raised for me; and I could not understand why he had so long kept secret what seemed to me an invaluable discovery instead of making science the richer by it. The immediate question, however, was whether it was possible to generalize from what he had found in a single case. The state of things which he had discovered seemed to me to be of so

1 [This word was omitted in the *SE* translation.]

fundamental a nature that I could not believe it could fail to be present in any case of hysteria if it had been proved to occur in a single one. But the question could only be decided by experience. I therefore began to repeat Breuer's investigations with my own patients and eventually, especially after my visit to Bernheim in 1889 had taught me the limitations of hypnotic suggestion, I worked at nothing else. After observing for several years that his findings were invariably confirmed in every case of hysteria that was accessible to such treatment, and after having accumulated a considerable amount of material in the shape of observations analogous to his, I proposed to him that we should issue a joint publication. At first he objected vehemently, but in the end he gave way, especially since, in the meantime, Janet's works had anticipated some of his results, such as the tracing back of hysterical symptoms to events in the patient's life, and their removal by means of hypnotic reproduction *in statu nascendi*. In 1893 we issued a preliminary communication, 'On the Psychical Mechanism of Hysterical Phenomena', and in 1895 there followed our book, *Studies on Hysteria*.

If the account I have so far given has led the reader to expect that the *Studies on Hysteria* must, in all essentials of their material content, be the product of Breuer's mind, that is precisely what I myself have always maintained and what it has been my aim to repeat here. As regards the *theory* put forward in the book, I was partly responsible, but to an extent which it is today no longer possible to determine.[1] That theory was in any case unpretentious and hardly went beyond the direct description of the observations. It did not seek to establish the nature
[22] of hysteria but merely to throw light upon the origin of its symptoms. Thus it laid stress upon the significance of the life of the emotions and upon the importance of distinguishing between mental acts which are unconscious and those which are conscious (or rather capable of being conscious); it introduced a dynamic factor, by supposing that a symptom arises through the damming up of an affect, and an economic factor, by regarding that same symptom as the product of the transformation of an amount of energy which would otherwise have been employed in some other way. (This latter process was described as *conversion*.) Breuer spoke of our method as *cathartic*; its therapeutic aim was explained as being to provide that the quota of affect used for maintaining the symptom, which had got on to the wrong lines and had, as it were, become strangulated there, should be directed on to the

1 [The subject of this paragraph and the next is discussed at some length in the Editors' Introduction to *Studies on Hysteria* (1895*d*), *RSE*, **2**, xxi ff.]

normal path along which it could obtain discharge [*Abfuhr*][T] (or *abreaction*). The practical results of the cathartic procedure were excellent. Its defects, which became evident later, were those of all forms of hypnotic treatment. There are still a number of psychotherapists who have not gone beyond catharsis as Breuer understood it and who still speak in its favour. Its value as an abridged method of treatment was shown afresh by Simmel [1918] in his treatment of war neuroses in the German army during the Great War. The theory of catharsis had not much to say on the subject of sexuality [*Sexualität*][T]. In the case histories which I contributed to the *Studies* sexual factors played a certain part, but scarcely more attention was paid to them than to other emotional excitations. Breuer wrote of the girl, who has since become famous as his first patient, that her sexual side was extraordinarily undeveloped.[1] It would have been difficult to guess from the *Studies on Hysteria* what an importance sexuality has in the aetiology of the neuroses.

abführen

Sex

The stage of development which now followed, the transition from catharsis to psychoanalysis proper, has been described by me several times already in such detail that I shall find it difficult to bring forward any new facts. The event which formed the opening of this period was Breuer's retirement from our common work, so that I became the sole administrator of his legacy. There had been differences of opinion between us at quite an early stage, but they had not been a ground for our separating. In answering the question of when it is that a mental process becomes pathogenic – that is, when it is that it becomes impossible for it to be dealt with normally – Breuer preferred what might be called a physiological theory: he thought that the processes which could not find a normal outcome [*Schicksal*][T] were such as had originated during unusual, 'hypnoid', mental states. This opened the further question of the origin of these hypnoid states. I, on the other hand, was inclined to suspect the existence of an interplay of forces [*Kräftespiel*][T] and the operation of intentions and purposes such as are to be observed in normal life. Thus it was a case of 'hypnoid hysteria' versus 'neuroses of defence' ['*Abwehrneurose*'][T]. But such differences as this would scarcely have alienated him from the subject if there had not been other factors at work. One of these was undoubtedly that his work as a physician and family doctor took up much of his time, and that he could not, like me, devote his whole strength to the work of catharsis. Again, he was affected by the reception which our book had received both in Vienna and in Germany. His self-confidence and powers of resistance were not

[23]

Kraft

Abwehr

1 [*RSE*, **2**, 19.]

developed so fully as the rest of his mental organization. When, for instance, the *Studies* met with a severe rebuff from Strümpell,[1] I was able to laugh at the lack of comprehension which his criticism showed, but Breuer felt hurt and grew discouraged. But what contributed chiefly to his decision was that my own further work led in a direction to which he found it impossible to reconcile himself.

The theory which we had attempted to construct in the *Studies* remained, as I have said, very incomplete; and in particular we had scarcely touched on the problem of aetiology, on the question of the ground in which the pathogenic process takes root. I now learnt from my rapidly increasing experience that it was not *any* kind of emotional excitation that was in action behind the phenomena of neurosis but habitually one of a sexual nature, whether it was a current sexual con-
[24] flict or the effect of earlier sexual experiences. I was not prepared for this conclusion and my expectations played no part in it, for I had begun my investigation of neurotics quite unsuspectingly. While I was writing my 'History of the Psychoanalytic Movement' in 1914, there recurred to my mind some remarks that had been made to me by Breuer, Charcot and Chrobak, which might have led me to this discovery earlier.[2] But at the time I heard them I did not understand what these authorities meant; indeed they had told me more than they knew themselves or were prepared to defend. What I heard from them lay dormant and inactive within me, until the chance of my cathartic experiments brought it out as an apparently original discovery. Nor was I then aware that in deriving hysteria from sexuality I was going back to the very beginnings of medicine and following up a thought of Plato's. It was not until later that I learnt this from an essay by Havelock Ellis.[3]

Under the influence of my surprising discovery, I now took a momentous step. I went beyond the domain of hysteria and began to investigate the sexual life of the so-called neurasthenics who used to visit me in numbers during my consultation hours. This experiment cost me, it is true, my popularity as a doctor, but it brought me convictions which today, almost thirty years later, have lost none of their force. There was

1 [Adolf von Strümpell (1853–1925), a well-known German neurologist, reviewed the book very critically (*Deutsch. Z. Nervenheilk*, **8** [1896], 159).]

2 [*RSE*, **14**, 10–11.]

3 [In a letter to Fliess of January 3, 1899 (Freud, 1950*a*, Letter 101), Freud mentioned an article by Havelock Ellis (1898*b*) which had appeared the previous October in the *St. Louis Alienist and Neurologist* on 'Hysteria in Relation to the Sexual Emotions' and which 'begins with Plato and ends with Freud'.]

a great deal of equivocation and mystery-making to be overcome, but, once that had been done, it turned out that in all of these patients grave abuses of the sexual function were present. Considering how extremely widespread are these abuses on the one hand and neurasthenia on the other, a frequent coincidence between the two would not have proved much; but there was more in it than that one bald fact. Closer observation suggested to me that it was possible to pick out from the confused jumble of clinical pictures covered by the name of neurasthenia two fundamentally different types, which might appear in any degree of mixture but which were nevertheless to be observed in their pure forms. [25]
In the one type the central phenomenon was the anxiety attack [*Angstanfall*]^{T} with its equivalents, rudimentary forms and chronic substitutive symptoms; I consequently gave it the name of *anxiety neurosis*, and limited the term *neurasthenia* to the other type.[1] Now it was easy to establish the fact that each of these types had a different abnormality of sexual life as its corresponding aetiological factor: in the former, *coitus interruptus*, unconsummated excitation [*Erregung*]^{T} and sexual abstinence, and in the latter, excessive masturbation and too numerous nocturnal emissions. In a few specially instructive cases, which had shown a surprising alteration in the clinical picture from one type to the other, it could be proved that there had been a corresponding change in the underlying sexual regime. If it was possible to put an end to the abuse and allow its place to be taken by normal sexual activity, a striking improvement in the condition was the reward. *Angst*

I was thus led into regarding the neuroses as being without exception disturbances of the sexual function, the so-called *actual neuroses* [*Aktualneurosen*]^{T} being the direct toxic expression of such disturbances and the *psychoneuroses* their mental expression. My medical conscience felt pleased at my having arrived at this conclusion. I hoped that I had filled in a gap in medical science, which, in dealing with a function of such great biological importance, had failed to take into account any injuries beyond those caused by infection or by gross anatomical lesions. The medical aspect [*Auffassung*]^{T} of the matter was, moreover, supported by the fact that sexuality was not something purely mental. It had a somatic side as well, and it was possible to assign special chemical processes to it and to attribute sexual excitation [*Sexualerregung*] to the presence of some particular, though at present unknown, substances.[2] There must also have been some good reason why the true spontaneous

1 [Freud, 1895*b*; *RSE*, **3**.]

2 [Cf. *Three Essays* (1905*d*), ibid., **7**, 190 and 191 *n*. 1; also Editors' Note, ibid., **7**, 112.]

neuroses resembled no group of diseases more closely than the phenomena of intoxication and abstinence, which are produced by the administration or privation of certain toxic substances, or than exophthalmic goitre, which is known to depend upon the product of the thyroid gland.

[26] Since that time I have had no opportunity of returning to the investigation of the 'actual neuroses';[1] nor has this part of my work been continued by anyone else. If I look back today at my early findings, they strike me as being the first rough outlines of what is probably a far more complicated subject. But on the whole they seem to me still to hold good. I should have been very glad if I had been able, later on, to make a psychoanalytic examination of some more cases of simple juvenile neurasthenia, but unluckily the occasion did not arise. To avoid misconceptions, I should like to make it clear that I am far from denying the existence of mental conflicts and of neurotic complexes in neurasthenia. All that I am asserting is that the symptoms of these patients are not mentally determined or removable by analysis, but that they must be regarded as direct toxic consequences of disturbed sexual chemical processes.

During the years that followed the publication of the *Studies*, having reached these conclusions upon the part played by sexuality in the aetiology of the neuroses, I read some papers on the subject before various medical societies, but was met with only incredulity and contradiction. Breuer did what he could for some time longer to throw the great weight of his personal influence into the scales in my favour, but he effected nothing and it was easy to see that he too shrank from recognizing the sexual aetiology of the neuroses. He might have crushed me or at least disconcerted me by pointing to his own first patient, in whose case sexual factors had ostensibly played no part whatever. But he never did so, and I could not understand why this was, until I came *Deutung* to interpret [*zu deuten*]^{T} the case correctly and to reconstruct, from some remarks which he had made, the conclusion of his treatment of it. After the work of catharsis had seemed [*schien*]^{t} to be completed, the girl had suddenly developed [*eingestellt*] a condition of 'transference love' ['*Übertragungsliebe*']^{T}; he had not [*nicht mehr*] connected this with her illness, and had therefore retired in dismay.[2] It was obviously painful to him to be reminded of this apparent *contretemps*. His attitude towards

1 [Freud discussed the question further soon after writing this – in *Inhibitions, Symptoms and Anxiety* (1926*d*), p. 97 f. below. A list of some of his other references to the subject can be found in an Editors' footnote to his paper on 'wild' psychoanalysis (1910*k*), *RSE*, **11**, 216 *n.* 1.]

2 [The full story is told by Ernest Jones (1953, 246 ff.).]

me oscillated for some time between appreciation and sharp criticism; [27]
then accidental difficulties arose, as they never fail to do in a strained situation, and we parted.

Another result of my taking up the study of nervous disorders in general was that I altered the technique of catharsis. I abandoned hypnotism and sought to replace it with some other method, because I was anxious not to be restricted to treating hysteriform conditions. Increasing experience had also given rise to two grave doubts in my mind as to the use of hypnotism even as a means to catharsis. The first was that even the most brilliant results were liable to be suddenly wiped away if my personal relation with the patient became disturbed. It was true that they would be re-established if a reconciliation could be effected; but such an occurrence proved that the personal emotional relation between doctor and patient was after all stronger than the whole cathartic process, and it was precisely that factor which escaped every effort at control. And one day I had an experience which showed me in the crudest light what I had long suspected. It related to one of my most acquiescent patients, with whom hypnotism had enabled me to bring about the most marvellous results, and whom I was engaged in relieving of her suffering by tracing back her attacks of pain to their origins. As she woke up on one occasion, she threw her arms round my neck. The unexpected entrance of a servant relieved us of an embarrassing discussion, but from that time onwards there was a tacit understanding between us that the hypnotic treatment should be discontinued. I was modest enough not to attribute the event to my own irresistible personal attraction, and I felt that I had now grasped the nature of the mysterious element that was at work behind hypnotism. In order to exclude it, or at all events to isolate it, it was necessary to abandon hypnotism.

But hypnotism had been of immense help in the cathartic treatment, by widening the field of the patient's consciousness and putting within his reach knowledge which he did not possess in his waking life. It seemed no easy task to find a substitute for it. While I was in this perplexity there came to my help the recollection of an experiment which I had often witnessed while I was with Bernheim. When the subject awoke from the state of somnambulism, he seemed to have lost all memory of what had happened while he was in that state. But Bernheim [28]
maintained that the memory was present all the same; and if he insisted on the subject remembering, if he asseverated that the subject knew it all and had only to say it, and if at the same time he laid his hand on the

subject's forehead, then the forgotten memories used in fact to return, hesitatingly at first, but eventually in a flood and with complete clarity.[1] I determined that I would act in the same way. My patients, I reflected, must in fact 'know' all the things which had hitherto only been made accessible to them in hypnosis; and assurances and encouragement on my part, assisted perhaps by the touch of my hand, would, I thought, have the power of forcing the forgotten facts and connections into consciousness. No doubt this seemed a more laborious process than putting the patients into hypnosis, but it might prove highly instructive. So I abandoned hypnotism, only retaining my practice of requiring the patient to lie upon a sofa while I sat behind him, seeing him, but not seen myself.

1 [Freud gave a detailed account of this episode in one of his very last pieces of writing, the unfinished fragment bearing the English title 'Some Elementary Lessons in Psycho-Analysis' (1940*b* [1938]), *RSE*, **23**, 267.]

III

My expectations were fulfilled; I was set free from hypnotism. But along [29]
with the change in technique the work of catharsis took on a new complexion. Hypnosis had screened from view an interplay of forces which now came in sight and the understanding of which gave a solid foundation to my theory.

How had it come about that the patients had forgotten so many of the facts of their external and internal lives but could nevertheless recollect them if a particular technique was applied? Observation supplied an exhaustive answer to these questions. Everything that had been forgotten had in some way or other been distressing; it had been either alarming or painful or shameful by the standards of the subject's personality. It was impossible not to conclude that that was precisely why it had been forgotten – that is, why it had not remained conscious. In order to make it conscious again in spite of this, it was necessary to overcome something that fought against one in the patient; it was necessary to make efforts on one's own part so as to urge and compel him to remember. The amount of effort required of the physician varied in different cases; it increased in direct proportion to the difficulty of what had to be remembered. The expenditure of force on the part of the physician was evidently the measure of a *resistance* on the part of the patient. It was only necessary to translate into words what I myself had observed, and I was in possession of the theory of *repression* [*Verdrängung*]^{T}.

It was now easy to reconstruct the pathogenic process. Let us keep to a simple example, in which a particular impulsion [*Strebung*] had arisen in the subject's mind but was opposed by other powerful impulsions. We should have expected the mental *conflict* which now arose to take the following course. The two dynamic quantities – for our present purposes let us call them 'the drive' [*Trieb*]^{T} and 'the resistance' – would struggle with each other for some time in the fullest light of consciousness, until the drive was repudiated and the cathexis of energy [*Energiebesetzung*]^{T} withdrawn from its impulsion. This would have *Besetzung*
been the normal solution. In a neurosis, however (for reasons which were still unknown), the conflict found a different outcome. The ego [*Ich*]^{T} drew back, as it were, on its first collision with the objectionable [30]
drive impulse [*Triebregung*]^{T}; it debarred the impulse from access to *Regung*

consciousness and to direct motor discharge, but at the same time the impulse retained its full cathexis of energy. I named this process *repression*; it was a novelty, and nothing like it had ever before been recognized in mental life. It was obviously a primary mechanism of defence [*Abwehrmechanismus*], comparable to an attempt at flight, and was only a forerunner of the later-developed normal condemning judgement. The first act of repression involved further consequences. In the first place the ego was obliged to protect itself against the constant threat of a renewed advance on the part of the repressed impulse by making a permanent expenditure of energy, an *anticathexis* [*Gegenbesetzung*], and it thus impoverished itself. On the other hand, the repressed impulse, which was now *unconscious*, was able to find means of discharge and of substitutive satisfaction by circuitous routes and thus to bring the whole purpose of the repression to nothing. In the case of conversion hysteria the circuitous route led to the somatic innervation; the repressed impulse broke its way through at some point or other and produced *symptoms*. The symptoms were thus results of a compromise, for although they were substitutive satisfactions they were nevertheless distorted and deflected from their aim owing to the resistance of the ego.

The theory of repression became the cornerstone of our understanding of the neuroses. A different view had now to be taken of the task of therapy. Its aim was no longer to 'abreact' an affect which had got on to the wrong lines but to uncover repressions and replace them with acts of judgement which might result either in the accepting or in the condemning of what had formerly been repudiated. I showed my recognition of the new situation by no longer calling my method of investigation and treatment *catharsis* but *psychoanalysis*.

It is possible[1] to take repression as a centre and to bring all the elements of psychoanalytic theory into relation with it. But before doing so I have a further comment of a polemical nature to make. According to Janet's view a hysterical woman was a wretched creature who, on account of a constitutional weakness, was unable to hold her mental acts together,
[31] and it was for that reason that she fell victim to a splitting of her mind and to a restriction of the field of her consciousness. The outcome of psychoanalytic investigations, on the other hand, showed that these phenomena were the result of dynamic factors – of mental conflict and of repression. This distinction seems to me to be far-reaching enough to put an end to the glib repetition of the view that whatever is of value in

1 [This paragraph was printed in small type in the 1925, 1928 and 1948 editions.]

psychoanalysis is merely borrowed from the ideas of Janet. The reader will have learnt from my account that historically psychoanalysis is completely independent of Janet's discoveries, just as in its content it diverges from them and goes far beyond them. Janet's works would never have had the implications which have made psychoanalysis of such importance to the human sciences [*Geisteswissenschaften*] and have made it attract such universal interest. I always treated Janet himself with respect, since his discoveries coincided to a considerable extent with those of Breuer, which had been made earlier but were published later than his. But when in the course of time psychoanalysis became a subject of discussion in France, Janet behaved ill, showed ignorance of the facts and used ugly arguments. And finally he revealed himself to my eyes and destroyed the value of his own work by declaring that when he had spoken of 'unconscious' mental acts he had meant nothing by the phrase – it had been no more than a *façon*[1] *de parler*.

But the study of pathogenic repressions and of other phenomena which have still to be mentioned compelled psychoanalysis to take the concept of the 'unconscious' seriously. Psychoanalysis regarded everything mental as being in the first instance unconscious; the further quality of 'consciousness' might also be present, or again it might be absent. This of course provoked a denial from the philosophers, for whom 'conscious' and 'mental' were identical, and who protested that they could not conceive of such an absurdity as the 'unconscious mental'. There was no help for it, however, and this idiosyncrasy of the philosophers could only be disregarded with a shrug. Experience (gained from pathological material, of which the philosophers were ignorant) of the frequency and power of impulses of which one knew nothing directly, and whose existence had to be inferred like any fact about the external [32]
world, left no alternative open. It could be pointed out, incidentally, that this was only treating one's own mental life as one had always treated other people's. One did not hesitate to ascribe mental processes to other people, although one had no immediate consciousness of them and could only infer them from their words and actions. But what held good for other people must be applicable to oneself. Anyone who tried to push the argument further and to conclude from it that one's own hidden processes belonged actually to a second *consciousness* would be faced with the concept of a consciousness of which one knew nothing, of an 'unconscious consciousness' – and this would scarcely be

1 [In the 1928 and 1948 editions this word was altered to '*manière*'.]

preferable to the assumption of an 'unconscious mental'. If on the other hand one declared, like some other philosophers, that one was prepared to take pathological phenomena into account, but that the processes underlying them ought not to be described as mental but as 'psychoid', the difference of opinion would degenerate into a barren dispute about words, though even so expediency would decide in favour of keeping the expression 'unconscious mental'. The further question as to the ultimate nature of this unconscious is no more sensible or profitable than the older one as to the nature of the conscious.

It would be more difficult to explain concisely how it came about that psychoanalysis made a further distinction in the unconscious, and separated it into a *preconscious* and an unconscious proper. It will be sufficient to say that it appeared a legitimate course to supplement the theories that were a direct expression of experience with hypotheses that were designed to facilitate the handling of the material and related to matters which could not be a subject of immediate observation. The very same procedure is adopted by the older sciences. The subdivision of the unconscious is part of an attempt to picture the apparatus of the mind as being built up of a number of *agencies* [*Instanzen*] or *systems* whose relations to one another are expressed in spatial terms, without, however, implying any connection with the actual anatomy of the brain. (I have described this as the *topographical* method of approach.) Such ideas as these are part of a speculative superstructure [*Überbau*] of psychoanalysis, any portion of which can be abandoned or changed
[33] without loss or regret the moment its inadequacy has been proved.[1] But there is still plenty to be described that lies closer to actual experience.

I have already mentioned that my investigation of the precipitating and underlying causes of the neuroses led me more and more frequently to conflicts between the subject's sexual impulses and his resistances to sexuality. In my search for the pathogenic situations in which the repressions of sexuality had set in and in which the symptoms, as substitutes for what was repressed, had had their origin, I was carried further and further back into the patient's life and ended by reaching the first years of his childhood. What poets and students of human nature had always asserted turned out to be true: the impressions of that early period of life, though they were for the most part buried in amnesia, left ineradicable traces upon the individual's development and in particular laid down the disposition to any nervous disorder that was to

1 [See below, p. 51 f.]

follow. But since these experiences of childhood were always concerned with sexual excitations and the reaction against them, I found myself faced with the fact of *infantile sexuality* – once again a novelty and a contradiction of one of the strongest of human prejudices. Childhood was looked upon as 'innocent' and free from the lusts of sex [*geschlechtlichen Gelüsten*][T], and the fight with the demon of 'sensuality' *Lust* was not thought to begin until the troubled age [*dem Sturm und Drang*][1] of puberty. Such occasional sexual activities as it had been impossible to overlook in children were put down as signs of degeneracy or premature depravity or as a curious freak of nature. Few of the findings of psychoanalysis have met with such universal contradiction or have aroused such an outburst of indignation as the assertion that the sexual function starts at the beginning of life and reveals its presence by important signs even in childhood. And yet no other finding of analysis can be demonstrated so easily and so completely.

Before going further into the question of infantile sexuality I must mention an error into which I fell for a while and which might well have had fatal consequences for the whole of my work. Under the influence of the technical procedure which I used at that time, the majority of my patients reproduced from their childhood scenes in which they were sexually seduced by some grown-up person. With female patients [34] the part of seducer was almost always assigned to their father. I believed these stories, and consequently supposed that I had discovered the roots of the subsequent neurosis in these experiences of sexual seduction in childhood. My confidence was strengthened by a few cases in which relations of this kind with a father, uncle or elder brother had continued up to an age at which memory was to be trusted. If the reader feels inclined to shake his head at my credulity, I cannot altogether blame him; though I may plead that this was at a time when I was intentionally keeping my critical faculty in abeyance so as to preserve an unprejudiced and receptive attitude towards the many novelties which were coming to my notice every day. When, however, I was at last obliged to recognize that these scenes of seduction had never taken place, and that they were only phantasies which my patients had made up or which I myself had perhaps forced on them, I was for some time completely at a loss.[2] My confidence alike in my technique and in its

1 [An allusion to the drama *Sturm und Drang* by Friedrich Maximilian Klinger, and thereby to the atmosphere of violence and irrationality that reigned in late eighteenth-century Germany.]

2 [Freud's first announcement of the discovery of his mistake was in a letter to Fliess of September 21, 1897 (Freud, 1950*a*, Letter 69). He intimated his change of opinion publicly in a paper on the part played by sexuality in the aetiology of the neuroses (1906*a*), *RSE*, 7, 283–5. It

results suffered a severe blow; it could not be disputed that I had arrived at these scenes by a technical method which I considered correct, and their subject matter was unquestionably related to the symptoms from which my investigation had started. When I had pulled myself together, I was able to draw the right conclusions from my discovery: namely, that the neurotic symptoms were not related directly to actual events but to wishful phantasies, and that as far as the neurosis was concerned psychical reality was of more importance than material reality. I do not believe even now that I forced the seduction phantasies on my patients, that I 'suggested' them. I had, in fact, stumbled for the first time upon the *Oedipus complex*, which was later to assume such an overwhelming importance, but which I did not recognize as yet in its disguise of phantasy. Moreover, seduction during childhood retained a certain share, [35] though a humbler one, in the aetiology of neuroses. But the seducers turned out as a rule to have been older children.

It will be seen, then, that my mistake was of the same kind as would be made by someone who believed that the legendary story of the early kings of Rome (as told by Livy) was historical truth instead of what it is in fact – a reaction against the memory of times and circumstances that were insignificant and occasionally, perhaps, inglorious. When the mistake had been cleared up, the path to the study of the sexual life of children lay open. It thus became possible to apply psychoanalysis to another field of science and to use its data as a means of discovering a new piece of biological knowledge.

The sexual function, as I found, is in existence from the very beginning of the individual's life, though at first it is attached to [*lehnte sich an*][T] the other vital functions and does not become independent of them until later; it has to pass through a long and complicated process of development before it becomes what we are familiar with as the normal sexual life of the adult. It begins by manifesting itself in the activity of a whole number of *component drives*. These are dependent upon *erotogenic zones* in the body; some of them make their appearance in pairs of opposite impulses (such as sadism and masochism or the *Schaulust* impulses to look [*Schautrieb*][T] and to be looked at [*Exhibitionslust*]); they operate independently of one another in a search for pleasure [*Lustgewinn*], and they find their object for the most part in the subject's own body. Thus at first the sexual function is non-centralized and

was not until nearly the end of his life that Freud (in Section III of his paper on 'Female Sexuality' (1931*b*), ibid., **21**, 227) explained that these phantasies of his patients had, in fact, originally been connected not with their father but with their mother.]

predominantly *auto-erotic*. Later, syntheses begin to appear in it; a first stage of organization is reached under the dominance of the *oral* components, an *anal-sadistic* stage follows, and it is only after the third stage has at last been reached that the primacy of the *genitals* is established and that the sexual function begins to serve the ends of reproduction. In the course of this process of development a number of elements of the various component drives turn out to be unserviceable for this last end and are therefore left on one side or turned to other uses, while others are diverted from their aims and carried over into the genital organization. I gave the name of *libido* to the energy of the sexual drives and to that form of energy alone. I was next driven to suppose that the libido does not always pass through its prescribed course of development smoothly. As a result either of the excessive strength of certain of [36]
the components or of experiences involving premature satisfaction, *fixations* [*Fixierungen*][T] of the libido may occur at various points in the course of its development. If subsequently a repression takes place, the libido flows back to these points (a process described as *regression*), and it is from them that the energy breaks through in the form of a symptom. Later on it further became clear that the localization of the point of fixation is what determines the *choice of neurosis*, that is, the form in which the subsequent illness makes its appearance.

The process of arriving at an *object*, which plays such an important part in mental life, takes place alongside of the organization of the libido. After the stage of *auto-erotism*, the first love object in the case of both sexes is the mother; and it seems probable that to begin with a child does not distinguish its mother's organ of nutrition from its own body. Later, but still in the first years of infancy, the relation known as the *Oedipus complex* becomes established: boys concentrate their sexual wishes upon their mother and develop hostile impulses against their father as being a rival, while girls adopt an analogous attitude.[1] All of the different variations and consequences of the Oedipus complex are

1 [*Footnote added* 1935:] The information about infantile sexuality was obtained from the study of men and the theory deduced from it was concerned with male children. It was natural enough to expect to find a complete parallel between the two sexes; but this turned out not to hold. Further investigations and reflections revealed profound differences between the sexual development of men and women. The first sexual object of a baby girl (just as of a baby boy) is her mother; and before a woman can reach the end of her normal development she has to change not only her sexual object but also her leading genital zone. From this circumstance difficulties arise and possibilities of inhibition which are not present in the case of men. [Freud had, in fact, begun to express doubts about the symmetry of the sexual development of the two sexes before the publication of the present work, notably in 'The Dissolution of the Oedipus Complex' (1924*d*), *RSE*, **19**, 167 ff.; and in another paper written only a very little later than this one, on the effects of the distinction between the sexes (1925*j*), ibid., **19**, 249 ff., he began fully to develop his new views. Cf. the Editors' Note to this last paper, ibid., **19**, 245 ff.]

important; and the innately bisexual constitution of human beings makes itself felt and increases the number of simultaneously active tendencies. Children do not become clear for quite a long time about the
[37] differences between the sexes; and during this period of *sexual researches* they produce typical *sexual theories* which, being circumscribed by the incompleteness of their authors' own physical development, are a mixture of truth and error and fail to solve the problems of sexual life (the riddle of the Sphinx – that is, the question of where babies come from). We see, then, that a child's first object choice is an *incestuous* one. The whole course of development that I have described is run through rapidly. For the most remarkable feature of the sexual life of man is its *diphasic* onset, its onset in two waves, with an interval between them. It reaches a first climax in the fourth or fifth year of a child's life. But thereafter this early efflorescence of sexuality passes off; the sexual impulses which have shown such liveliness are overcome by repression, and a *period of latency* follows, which lasts until puberty and during which the *reaction-formations* of morality, shame and disgust are built up.[1] Of all living creatures man alone seems to show this diphasic onset of sexual growth, and it may perhaps be the biological determinant of his predisposition to neuroses. At puberty the impulses and object relations of a child's early years become reanimated, and among them the emotional ties of its Oedipus complex. In the sexual life of puberty there is a struggle between the urges of early years and the inhibitions of the latency period. Before this, and while the child is at the highest point of its infantile sexual development, a genital organization of a sort is established; but only the male genitals play a part in it, and the female ones remain undiscovered. (I have described this as the period of *phallic* primacy.) At this stage the contrast between the sexes is not stated in terms of 'male' or 'female' but of 'possessing a penis' or 'castrated'. The *castration complex* which arises in this connection is of the profoundest importance in the formation alike of character and of neuroses.

In order to make this condensed account of my discoveries upon the sexual life of man more intelligible, I have brought together conclusions which I reached at different dates and incorporated by way of supple-
[38] ment or correction in the successive editions of my *Three Essays on the Theory of Sexuality* (1905*d*). I hope it will have been easy to gather the

1 [*Footnote added* 1935:] The period of latency is a physiological phenomenon. It can, however, only give rise to a complete interruption of sexual life in cultural organizations which have made the suppression of infantile sexuality a part of their system. This is not the case with the majority of primitive peoples.

nature of my extension (on which so much stress has been laid and which has excited so much opposition) of the concept of sexuality. That extension is of a twofold kind. In the first place sexuality is divorced from its too close connection with the genitals and is regarded as a more comprehensive bodily function, having pleasure as its goal and only secondarily coming to serve the ends of reproduction. In the second place the sexual impulses are regarded as including all of those merely affectionate and friendly impulses to which usage applies the exceedingly ambiguous word 'love'. I do not, however, consider that these extensions are innovations but rather restorations: they signify the removal of inexpedient limitations of the concept into which we had allowed ourselves to be led.

The detaching of sexuality from the genitals has the advantage of allowing us to bring the sexual activities of children and of perverts into the same scope as those of normal adults. The sexual activities of children have hitherto been entirely neglected and, though those of perverts have been recognized, it has been with moral indignation and without understanding. Looked at from the psychoanalytic standpoint [*Auffassung*], even the most eccentric and repellent perversions are explicable as manifestations of component drives of sexuality which have freed themselves from the primacy of the genitals and are now in pursuit of pleasure on their own account as they were in the very early days of the libido's development. The most important of these perversions, homosexuality, scarcely deserves the name. It can be traced back to the constitutional bisexuality of all human beings and to the after-effects of the phallic primacy. Psychoanalysis enables us to point to some trace or other of a homosexual object choice in everyone. If I have described children as 'polymorphously perverse',[1] I was only using a terminology that was generally current; no moral judgement was implied by the phrase. Psychoanalysis has no concern whatever with such judgements of value.

The second of my alleged extensions of the concept of sexuality finds its justification in the fact revealed by psychoanalytic investigation that all of these affectionate impulses were originally of a completely sexual [39] nature but have become *inhibited in their aim* or *sublimated*. The manner in which the sexual drives can thus be influenced and diverted enables them to be employed for cultural activities of every kind, to which indeed they bring the most important contributions.

My surprising discoveries as to the sexuality of children were made

1 [*RSE*, 7, 169.]

in the first instance through the analysis of adults. But later (from about 1908 onwards) it became possible to confirm them fully and in every detail by direct observations upon children.[1] Indeed, it is so easy to convince oneself of the regular sexual activities of children that one cannot help asking in astonishment how the human race can have succeeded in overlooking the facts and in maintaining for so long the wishful legend of the asexuality of childhood. This surprising circumstance must be connected with the amnesia which, with the majority of adults, hides their own infancy.

1 [Cf. the analysis of 'Little Hans' (1909*b*), *RSE*, **10**.]

IV

The theories of resistance and of repression, of the unconscious, of the [40]
aetiological significance of sexual life and of the importance of infantile experiences – these form the principal constituents of the theoretical structure of psychoanalysis. In these pages, unfortunately, I have been able to describe only the separate elements and not their interconnections and their bearing upon one another. But I am obliged now to turn to the alterations which gradually took place in the technique of the analytic method.

The means which I first adopted for overcoming the patient's resistance, by insistence and encouragement, had been indispensable for the purpose of giving me a first general survey of what was to be expected. But in the long run it proved to be too much of a strain on both sides, and further, it seemed open to certain obvious criticisms. It therefore gave place to another method which was in one sense its opposite. Instead of urging the patient to say something upon some particular subject, I now asked him to abandon himself to a process of *free association* [*freien 'Assoziation'*][T] – that is, to say whatever came into his head, while ceasing to give any conscious direction [*Zielvorstellung*] to his thoughts. It was essential, however, that he should bind himself to report literally everything that occurred to his self-perception and not to give way to critical objections which sought to put certain associations [*Einfälle*] on one side on the ground that they were not sufficiently important or that they were irrelevant or that they were altogether meaningless. There was no necessity to repeat explicitly the demand for candour on the patient's part in reporting his thoughts, for it was the precondition of the whole analytic treatment.

It may seem surprising that this method of free association, carried out subject to the observation of the *fundamental rule of psychoanalysis*, should have achieved what was expected of it, namely the bringing into consciousness of the repressed material which was held back by resistances. We must, however, bear in mind that free association is not really free. The patient remains under the influence of the analytic situation even though he is not directing his mental activities on to a particular subject. We shall be justified in assuming that nothing will occur to him that has not some reference to that situation. His resist- [41]
ance against reproducing the repressed material will now be expressed

in two ways. Firstly, it will be shown by critical objections; and it was to deal with these that the fundamental rule of psychoanalysis was invented. But if the patient observes that rule and so overcomes his reticences, the resistance will find another means of expression. It will so arrange it that the repressed material itself will never occur to the patient but only something which approximates to it in an allusive way; and the greater the resistance, the more remote from the actual idea that the analyst is in search of will be the substitutive association which the patient has to report. The analyst, who listens composedly but without any constrained effort to the stream of associations and who, from his experience, has a general notion of what to expect, can make use of the material brought to light by the patient according to two possibilities. If the resistance is slight he will be able from the patient's allusions to infer the unconscious material itself; or if the resistance is stronger he will be able to recognize its character from the associations, as they seem to become more remote from the topic in hand, and will explain it to the patient. Uncovering the resistance, however, is the first step towards overcoming it. Thus the work of analysis involves an *art of interpretation* [*Deutungskunst*], the successful handling of which may require tact and practice but which is not hard to acquire. But it is not only in the saving of labour that the method of free association has an advantage over the earlier method. It exposes the patient to the least possible amount of compulsion, it never allows of contact being lost with the actual current situation, it guarantees to a great extent that no factor in the structure [*Struktur*]^{T} of the neurosis will be overlooked and that nothing will be introduced into it by the expectations of the analyst. It is left to the patient in all essentials to determine the course of the analysis and the arrangement of the material; any systematic handling of particular symptoms or complexes thus becomes impossible. In complete contrast to what happened with hypnotism and with the pressure method, interrelated material makes its appearance at different times and at different points in the treatment. To a spectator, therefore – though, in fact, there must be none – an analytic treatment would seem completely obscure.

[42] Another advantage of the method is that it need never break down. It must theoretically always be possible to have an association, provided that no conditions are made as to its character. Yet there is one case in which, in fact, a breakdown [*Versagen*]^{T} occurs with absolute regularity; from its very uniqueness, however, this case too can be interpreted.

Versagung

I now come to the description of a factor which adds an essential

feature to my picture of analysis and which can claim, alike technically and theoretically, to be regarded as of the first importance. In every analytic treatment there arises, without the physician's agency, an intense emotional relationship between the patient and the analyst which is not to be accounted for by the actual situation. It can be of a positive or of a negative character and can vary between the extremes of a passionate, completely sensual love and the unbridled expression of an embittered defiance and hatred. This *transference* ['*Übertragung*'] – to give it its short name – soon replaces in the patient's mind the desire to be cured, and, so long as it is affectionate and moderate, becomes the agent of the physician's influence and neither more nor less than the mainspring of the joint work of analysis. Later on, when it has become passionate or has been converted into hostility, it becomes the principal tool of the resistance. It may then happen that it will paralyse the patient's powers of associating and endanger the success of the treatment. Yet it would be senseless to try to evade it; for an analysis without transference is an impossibility. It must not be supposed, however, that transference is created by analysis and does not occur apart from it. Transference is merely uncovered and isolated by analysis. It is a universal phenomenon of the human mind, it decides the success of all medical influence, and in fact dominates the whole of each person's relations to his human environment. We can easily recognize it as the same dynamic factor which the hypnotists have named 'suggestibility', which is the agent of hypnotic rapport and whose incalculable behaviour led to difficulties with the cathartic method as well. When there is no inclination to a transference of emotion such as this, or when it has become entirely negative, as happens in dementia praecox or paranoia, then there is also no possibility of influencing the patient by psychological means.

It is perfectly true that psychoanalysis, like other psychotherapeutic [43]
methods, employs the instrument of suggestion (or transference). But the difference is this: that in analysis it is not allowed to play the decisive part in determining the therapeutic results. It is used instead to induce the patient to perform a piece of psychical work – the overcoming of his transference resistances – which involves a permanent alteration in his mental economy. The transference is made conscious to the patient by the analyst, and it is resolved by convincing him that in his transference attitude he is *re-experiencing* emotional relations which had their origin in his earliest object attachments [*Objektbesetzungen*] during the repressed period of his childhood. In this way

the transference is changed from the strongest weapon of the resistance into the best instrument of the analytic treatment. Nevertheless its handling remains the most difficult as well as the most important part of the technique of analysis.

With the help of the method of free association and of the related art of interpretation, psychoanalysis succeeded in achieving one thing which appeared to be of no practical importance but which, in fact, necessarily led to a totally fresh attitude and a fresh scale of values in scientific thought. It became possible to prove that *dreams* have a meaning, and to discover it. In classical antiquity great importance was attached to dreams as foretelling the future; but modern science would have nothing to do with them, it handed them over to superstition, declaring them to be purely 'somatic' processes – a kind of twitching of a mind that is otherwise asleep. It seemed quite inconceivable that anyone who had done serious scientific work could make his appearance as an 'interpreter of dreams'. But by disregarding the excommunication pronounced upon dreams, by treating them as unexplained neurotic symptoms, as delusional or obsessional ideas, by neglecting their apparent content and by making their separate component images into subjects for free association, psychoanalysis arrived at a different conclusion. The numerous associations produced by the dreamer led to the discovery of a thought structure [*Gedankengebilde*] which could no longer be described as absurd or confused, which ranked as a completely valid psychical product, and of which the *manifest* dream was no more than a distorted, abbreviated and misunderstood translation
[44] [*Übersetzung*][T], and for the most part a translation into visual images. These *latent dream thoughts* contained the meaning of the dream, while its manifest content was simply a make-believe, a façade, which could serve as a starting point for the associations but not for the interpretation.

There were now a whole series of questions to be answered, among the most important of them being whether the formation of dreams had a motive [*Motiv*][T], under what conditions it took place, by what methods the dream thoughts (which are invariably full of sense) become converted into the dream (which is often senseless), and others besides. I attempted to solve all of these problems in *The Interpretation of Dreams*, which I published in the year 1900. I can find space here for only the briefest abstract of my investigation. When the latent dream thoughts that are revealed by the analysis of a dream are examined, one

of them is found to stand out from among the rest, which are intelligible and well known to the dreamer. These latter thoughts are residues of waking life (the *day's residues*, as they are called technically); but the isolated thought is found to be a wishful impulse, often of a very repellent kind, which is foreign to the waking life of the dreamer and is consequently disavowed by him with surprise or indignation. This impulse is the actual constructor of the dream: it provides the energy for its production and makes use of the day's residues as material. The dream which thus originates represents a situation of satisfaction for the impulse, it is the fulfilment of its wish. It would not be possible for this process to take place without being favoured by the presence of something in the nature of a state of sleep. The necessary mental precondition of sleep is the concentration of the ego upon the wish to sleep and the withdrawal of psychical energy from all the interests of life. Since at the same time all the paths of approach to motility are blocked, the ego is also able to reduce the expenditure [of energy] by which at other times it maintains the repressions. The unconscious impulse makes use of this nocturnal relaxation of repression in order to push its way into consciousness with the dream. But the repressive resistance of the ego is not abolished in sleep but merely reduced. Some of it remains in the shape of a *censorship of dreams* and forbids the unconscious impulse to express itself in the forms which it would properly assume. In consequence of the severity of the censorship of dreams, the latent dream thoughts are [45]
obliged to submit to being altered and softened so as to make the forbidden meaning of the dream unrecognizable. This is the explanation of *dream distortion*, which accounts for the most striking characteristics of the manifest dream. We are therefore justified in asserting that *a dream is the (disguised) fulfilment of a (repressed) wish*. It will now be seen that dreams are constructed like a neurotic symptom: they are compromises between the demands of a repressed impulse and the resistance of a censoring force [*Macht*][T] in the ego. Since they have a similar origin they are equally unintelligible and stand in equal need of interpretation.

There is no difficulty in discovering the general function of dreaming. It serves the purpose of fending off [*abzuwehren*], by a kind of soothing action, external or internal stimuli which would tend to arouse the sleeper, and thus of securing sleep against interruption. External stimuli are fended off by being given a new interpretation and by being woven into some harmless situation; internal stimuli, caused by drive demands, are given free play by the sleeper and allowed to find satisfaction in the formation of dreams, so long as the latent dream thoughts submit to the

control of the censorship. But if they threaten to break free and the meaning of the dream becomes too plain, the sleeper cuts short the dream and wakes in a fright. (Dreams of this class are known as *anxiety dreams*.) A similar failure in the function of dreaming occurs if an external stimulus becomes too strong to be fended off. (This is the class of *arousal dreams*.) I have given the name of *dream-work* to the process which, with the cooperation of the censorship, converts the latent thoughts into the manifest content of the dream. It consists of a peculiar way of treating the preconscious material of thought, so that its component parts become *condensed* [*verdichtet*][T], its psychical emphasis becomes *displaced* [*verschoben*][T], and the whole of it is translated into visual images or *dramatized*, and completed by a deceptive *secondary revision*. The dream-work is an excellent example of the processes occurring in the deeper, unconscious layers of the mind, which differ considerably from the familiar normal processes of thought. It also displays a number of archaic characteristics, such as the use of a *symbolism* (in this case of a predominantly sexual kind) which it has since also been possible to discover in other spheres of mental activity.

Verschiebung

[46] We have explained that the unconscious drive impulse of the dream connects itself with a residue of the day, with some interest of waking life which has not been disposed of; it thus gives the dream which it constructs a double value for the work of analysis. For, on the one hand, a dream that has been analysed reveals itself as the fulfilment of a repressed wish; but, on the other hand, it may be a continuation of some preconscious activity of the day before and may contain every kind of subject matter and give expression to an intention, a warning, a reflection, or once more to the fulfilment of a wish. Analysis exploits the dream in both directions, as a means of obtaining knowledge alike of the patient's conscious and of his unconscious processes. It also profits from the fact that dreams have access to the forgotten material of childhood, and so it happens that infantile amnesia is for the most part overcome in connection with the interpretation of dreams. In this respect dreams achieve a part of what was previously the task of hypnotism. On the other hand, I have never maintained the assertion which has so often been ascribed to me that dream interpretation shows that all dreams have a sexual content or are derived from sexual driving forces [*Triebkräfte*]. It is easy to see that hunger, thirst, or the need to excrete, can produce dreams of satisfaction just as well as any repressed sexual or egoistic [*egoistische*] impulse. The case of young children affords us a convenient test of the validity of our theory of dreams. In them the various psychical systems

are not yet sharply divided and the repressions have not yet grown deep, so that we often come upon dreams which are nothing more than undisguised fulfilments of wishful impulses left over from waking life. Under the influence of imperative needs, adults may also produce dreams of this infantile type.[1]

In the same way that psychoanalysis makes use of dream interpretation, it also profits by the study of the numerous little slips and mistakes [*Fehlleistungen*][T] which people make – symptomatic actions, as they are called. I investigated this subject in a series of papers which were published for the first time in book form in 1904 under the title of *The Psychopathology of Everyday Life* [Freud, 1901*b*; *RSE*, **6**, 1 ff.]. In this widely circulated work I have pointed out that these phenomena are not accidental, that they require more than physiological explanations, that they have a meaning and can be interpreted, and that one is justified in inferring from them the presence of restrained or repressed impulses and intentions. But what constitutes the enormous importance of dream interpretation, as well as of this latter study, is not the assistance they give to the work of analysis but another of their attributes. Previously psychoanalysis had been concerned only with solving pathological phenomena and in order to explain them it had often been driven into making assumptions whose comprehensiveness was out of all proportion to the importance of the actual material under consideration. But when it came to dreams, it was no longer dealing with a pathological symptom, but with a phenomenon of normal mental life which might occur in any healthy person. If dreams turned out to be constructed like symptoms, if their explanation required the same assumptions – the repression of impulses, substitutive formation, compromise formation, the dividing of the conscious and the unconscious into various psychical systems – then psychoanalysis was no longer an auxiliary science in the field of psychopathology, it was rather the starting point of a new and deeper science of the mind which would be equally indispensable for the understanding of the normal. Its postulates and findings could be carried over to other regions of mental happening; a path lay open to it that led far afield, into spheres of universal interest. [47]

1 [*Footnote added* 1935:] When it is considered how frequently the function of dreaming miscarries, the dream may aptly be characterized as an *attempt* at the fulfilment of a wish. Aristotle's old definition of the dream as mental life during sleep still holds good. There was a reason for my choosing as the title of my book not *The Dream* but *The Interpretation of Dreams*.

V

[48] I must interrupt my account of the internal growth of psychoanalysis and turn to its external history. What I have so far described of its discoveries has related for the most part to the results of my own work; but I have also filled in my story with material from later dates and have not distinguished between my own contributions and those of my pupils and followers.

For more than ten years after my separation from Breuer I had no followers. I was completely isolated. In Vienna I was shunned; abroad no notice was taken of me. My *Interpretation of Dreams*, published in 1900, was scarcely reviewed in the technical journals. In my paper 'On the History of the Psychoanalytic Movement' [1914*d*; *RSE*, **14**, 5 ff.] I mentioned as an instance of the attitude adopted by psychiatric circles in Vienna a conversation with an assistant at the clinic [at which I lectured], who had written a book against my theories but had never read my *Interpretation of Dreams*. He had been told at the clinic that it was not worthwhile. The man in question, who has since become a professor, has gone so far as to repudiate my report of the conversation and to throw doubts in general upon the accuracy of my recollection. I can only say that I stand by every word of the account I then gave.[1]

As soon as I realized the inevitable nature of what I had come up against, my sensitiveness greatly diminished. Moreover, my isolation gradually came to an end. To begin with, a small circle of pupils gathered round me in Vienna; and then, after 1906, came the news that the psychiatrists at Zürich, E. Bleuler,[2] his assistant, C. G. Jung, and others, were taking a lively interest in psychoanalysis. We got into personal touch with one another, and at Easter 1908 the friends of the young science met at Salzburg, agreed upon the regular repetition of similar informal congresses and arranged for the publication of a journal which was edited by Jung and was given the title of *Jahrbuch für psychoanalytische und psychopathologische Forschungen* [*Yearbook for*
[49] *Psychoanalytic and Psychopathological Research*]. It was brought out under the direction of Bleuler and myself and ceased publication at the beginning of the [First] World War. At the same time that the Swiss

1 [Cf. *RSE*, **14**, 19.]

2 [Eugen Bleuler (1857–1939) was at the head of the Burghölzli, the Zürich public mental hospital.]

psychiatrists joined the movement, interest in psychoanalysis began to be aroused all over Germany as well; it became the subject of a large number of written comments and of lively discussions at scientific congresses. But its reception was nowhere friendly or even benevolently non-committal. After the briefest acquaintance with psychoanalysis German science was united in rejecting it.

Even today it is of course impossible for me to foresee the final judgement of posterity upon the value of psychoanalysis for psychiatry, psychology and the human sciences in general. But I fancy that, when the history of the phase we have lived through comes to be written, German science will not have cause to be proud of those who represented it. I am not thinking of the fact that they rejected psychoanalysis or of the decisive way in which they did so; both of these things were easily intelligible, they were only to be expected and at any rate they threw no discredit on the character of the opponents of analysis. But for the degree of arrogance which they displayed, for their conscienceless contempt of logic, and for the coarseness and bad taste of their attacks there could be no excuse. It may be said that it is childish of me to give free rein to such feelings as these now, after fifteen years have passed; nor would I do so unless I had something more to add. Years later, during the World War, when a chorus of enemies were bringing against the German nation the charge of barbarism, a charge which sums up all that I have written above, it nonetheless hurt deeply to feel that my own experience would not allow me to contradict it.[1]

One of my opponents[2] boasted of silencing his patients as soon as they began to talk of anything sexual and evidently thought that this technique gave him a right to judge the part played by sexuality in the aetiology of the neuroses. Apart from emotional resistances, which were so easily explicable by the psychoanalytic theory that it was impossible to be misled by them, it seemed to me that the main obstacle to agreement lay in the fact that my opponents regarded psychoanalysis as a product of my speculative imagination and were unwilling to believe in the long, patient and unbiased work which had gone to its making. Since in their opinion analysis had nothing to do with observation or experience, they believed that they themselves were justified in rejecting it without experience. Others again, who did not feel so strongly convinced of this, repeated in their resistance the classical manoeuvre [50]

1 [Cf. a paragraph in 'Thoughts for the Times on War and Death', written during the war (1915*b*), *RSE*, **14**, 278–9.]

2 [This paragraph was printed in small type in the 1925, 1928 and 1948 editions.]

of not looking through the microscope so as to avoid seeing what they had denied. It is remarkable, indeed, how incorrectly most people act when they are obliged to form a judgement of their own on some new subject. For years I have been told by 'benevolent' critics – and I hear the same thing even today – that psychoanalysis is right up to such-and-such a point but that there it begins to exaggerate and to generalize without justification. And I know that, though nothing is more difficult than to decide where such a point lies, these critics had been completely ignorant of the whole subject only a few weeks or days earlier.

The result of the official anathema against psychoanalysis was that the analysts began to come closer together. At the second Congress, held at Nuremberg in 1910, they formed themselves, on the proposal of Ferenczi, into an 'International Psycho-Analytical Association' divided into a number of local societies but under a common president. The Association survived the Great War and still exists, consisting today of branch societies in Austria, Germany, Hungary, Switzerland, Great Britain, Holland, Russia and India, as well as two in the United States.[1] I arranged that C. G. Jung should be appointed as the first president, which turned out later to have been a most unfortunate step. At the same time a second journal devoted to psychoanalysis was started, the *Zentralblatt für Psychoanalyse* [*Central Journal for Psychoanalysis*], edited by Adler and Stekel, and a little later a third, *Imago*, edited by
[51] two non-medical analysts, H. Sachs and O. Rank, and intended to deal with the application of analysis to the human sciences. Soon afterwards Bleuler [1910*a*] published a paper in defence of psychoanalysis. Though it was a relief to find honesty and straightforward logic for once taking part in the dispute, yet I could not feel completely satisfied by Bleuler's essay. He strove too eagerly for an appearance of impartiality; nor is it a matter of chance that it is to him that our science owes the valuable concept of *ambivalence*. In later papers Bleuler adopted such a critical attitude towards the theoretical structure of analysis and rejected or threw doubts upon such essential parts of it that I could not help asking myself in astonishment what could be left of it for him to admire. Yet not only has he subsequently uttered the strongest pleas in favour of 'depth psychology' but he based his comprehensive study of schizophrenia [Bleuler, 1911] upon it. Nevertheless Bleuler did not for long remain a member of the International Psychoanalytical

1 [In the German this reads '. . . local groups in Vienna, Berlin, Budapest, Zürich, London, Holland, New York, Pan-America, Moscow and Calcutta'. The author specifically approved the change for the English translation.]

Association; he resigned from it as a result of misunderstandings with Jung, and the Burghölzli[1] was lost to analysis.

Official disapproval could not hinder the spread of psychoanalysis either in Germany or in other countries. I have elsewhere [1914*d*] followed the stages of its growth and given the names of those who were its first representatives. In 1909 G. Stanley Hall invited Jung and me to America to go to Clark University, Worcester, Mass., of which he was president, and to spend a week giving lectures (in German) at the celebration of the twentieth anniversary of that body's foundation. Hall was justly esteemed as a psychologist and educationalist, and had introduced psychoanalysis into his courses several years earlier; there was a touch of the 'king-maker' about him, a pleasure in setting up authorities and in then deposing them. We also met James J. Putnam there, the Harvard neurologist, who in spite of his age was an enthusiastic supporter of psychoanalysis and threw the whole weight of a personality that was universally respected into the defence of the cultural value of analysis and the purity of its aims. He was an estimable man, in whom, as a reaction against a predisposition to obsessional neurosis, an ethical bias predominated; and the only thing in him that was disquieting was his inclination to attach psychoanalysis to a particular philosophical system and to make it the servant of moral aims.[2] Another event of this time [52] which made a lasting impression on me was a meeting with William James, the philosopher. I shall never forget one little scene that occurred as we were on a walk together. He stopped suddenly, handed me a bag he was carrying and asked me to walk on, saying that he would catch me up as soon as he had got through an attack of angina pectoris which was just coming on. He died of that disease a year later; and I have always wished that I might be as fearless as he was in the face of approaching death.

At that time I was only fifty-three. I felt young and healthy, and my short visit to the new world encouraged my self-respect in every way. In Europe I felt as though I were despised; but over there I found myself received by the foremost men as an equal. As I stepped on to the platform at Worcester to deliver my *Five Lectures on Psychoanalysis* [1910*a*; *RSE*, **11**, 11 ff.] it seemed like the realization of some incredible daydream: psychoanalysis was no longer a product of delusion, it had become a valuable part of reality. It has not lost ground in America since

1 [See footnote 2, p. 42 above.]

2 [Cf. Freud's obituary of him (1919*b*), *RSE*, **17**, 263, and his Preface to a collection of his writings (1921*a*), ibid., **18**, 259.]

our visit; it is extremely popular among the lay public and is recognized by a number of official psychiatrists as an important element in medical training. Unfortunately, however, it has suffered a great deal from being watered down. Moreover, many abuses which have no relation to it find a cover under its name, and there are few opportunities for any thorough training in technique or theory. In America, too, it has come into conflict with Behaviourism, a theory which is naive enough to boast that it has put the whole problem of psychology completely out of court.

In Europe during the years 1911–13 two secessionist movements from psychoanalysis took place, led by men who had previously played a considerable part in the young science, Alfred Adler and C. G. Jung. Both movements seemed most threatening and quickly obtained a large following. But their strength lay, not in their own content, but in the temptation which they offered of being freed from what were felt as the repellent findings of psychoanalysis even though its actual material was
[53] no longer rejected. Jung attempted to give to the facts of analysis a fresh interpretation of an abstract, impersonal and non-historical character, and thus hoped to escape the need for recognizing the importance of infantile sexuality and of the Oedipus complex as well as the necessity for any analysis of childhood. Adler seemed to depart still further from psychoanalysis; he entirely repudiated the importance of sexuality, traced back the formation both of character and of the neuroses solely to men's desire for power and to their need to compensate for their constitutional inferiorities, and threw all the psychological discoveries of psychoanalysis to the winds. But what he had rejected forced its way back into his closed system under other names; his 'masculine protest' is nothing else than repression unjustifiably sexualized. The criticism with which the two heretics were met was a mild one; I insisted only that both Adler and Jung should cease to describe their theories as 'psychoanalysis'. After a lapse of ten years it can be asserted that both of these attempts against psychoanalysis have blown over without doing any harm.

If a community is based on agreement upon a few cardinal points, it is obvious that people who have abandoned that common ground will cease to belong to it. Yet the secession of former pupils has often been brought up against me as a sign of my intolerance or has been regarded as evidence of some special fatality that hangs over me. It is a sufficient answer to point out that in contrast to those who have left me, like Jung, Adler, Stekel, and a few besides, there are a great number of men, like Abraham, Eitingon, Ferenczi, Rank, Jones, Brill, Sachs, Pfister, van

Emden, Reik, and others, who have worked with me for some fifteen years in loyal collaboration and for the most part in uninterrupted friendship. I have mentioned only the oldest of my pupils, who have already made a distinguished name for themselves in the literature of psychoanalysis; if I have passed over others, that is not to be taken as a slight, and indeed among those who are young and have joined me lately talents are to be found on which great hopes may be set. But I think I can say in my defence that an intolerant man, dominated by an arrogant belief in his own infallibility, would never have been able to maintain his hold upon so large a number of intellectually eminent people, especially if he had at his command as few practical attractions as I had.

The World War, which broke up so many other organizations, could [54] do nothing against our 'International'. The first meeting after the war took place in 1920, at The Hague, on neutral ground. It was moving to see how hospitably the Dutch welcomed the starving and impoverished subjects of the Central European states; and I believe this was the first occasion in a ruined world on which Englishmen and Germans sat at the same table for the friendly discussion of scientific interests. Both in Germany and in the countries of Western Europe the war had actually stimulated interest in psychoanalysis. The observation of war neuroses had at last opened the eyes of the medical profession to the importance of psychogenesis in neurotic disturbances, and some of our psychological conceptions, such as the 'gain from illness' and the 'flight into illness', quickly became popular. The last Congress before the German collapse, which was held at Budapest in 1918, was attended by official representatives of the allied governments of the Central European powers, and they agreed to the establishment of psychoanalytic centres for the treatment of war neuroses. But this point was never reached. Similarly, too, the comprehensive plans made by one of our leading members, Dr Anton von Freund, for establishing in Budapest a centre for analytic study and treatment came to grief as a result of the political upheavals that followed soon afterwards and of the premature death of their irreplaceable author.[1] At a later date some of his ideas were put into execution by Max Eitingon, who in 1920 founded a psychoanalytical clinic in Berlin. During the brief period of Bolshevik rule in Hungary, Ferenczi was still able to carry on a successful course of instruction as the official representative of psychoanalysis at the University of Budapest. After the war our opponents were pleased to announce that events had produced a conclusive argument against the validity of the theses

1 [Freud wrote his obituary (1920*c*), *RSE*, **18**, 257.]

of analysis. The war neuroses, they said, had proved that sexual factors were unnecessary to the aetiology of neurotic disorders. But their triumph was frivolous and premature. For, on the one hand, no-one had been able to carry out a thorough analysis of a case of war neurosis, so that, in fact, nothing whatever was known for certain as to their motivation and no conclusions could be drawn from this uncertainty; while,
[55] on the other hand, psychoanalysis had long before arrived at the concept of narcissism and of narcissistic neuroses, in which the subject's libido is attached to his own ego instead of to an object.[1] Though on other occasions, therefore, the charge was brought against psychoanalysis of having made an unjustifiable extension of the concept of sexuality, yet, when it became convenient for controversial ends, this crime was forgotten and we were once more held down to the narrowest meaning of the word.

If the preliminary cathartic period is left on one side, the history of psychoanalysis falls from my point of view into two phases. In the first of these I stood alone and had to do all the work myself: this was from 1895–6 until 1906 or 1907. In the second phase, lasting from then until the present time, the contributions of my pupils and collaborators have been growing more and more in importance, so that today, when a grave illness warns me of the approaching end, I can think with a quiet mind of the cessation of my own labours.[2] For that very reason, however, it is impossible for me in this *Autobiographical Study* to deal as fully with the progress of psychoanalysis during the second phase as I did with its gradual rise during the first phase, which was concerned with my own activity alone. I feel that I should be justified in mentioning here only those new discoveries in which I still played a prominent part, in particular, therefore, those made in the sphere of narcissism, of the theory of the drives, and of the application of psychoanalysis to the psychoses.

I must begin by adding that increasing experience showed more and more plainly that the Oedipus complex was the nucleus of the neurosis. It was at once the climax of infantile sexual life and the point of junction from which all of its later developments proceeded. But if so, it was no longer possible to expect analysis to discover a factor that was specific in the aetiology of the neuroses. It must be true, as Jung expressed it so

1 [Cf. Freud's Introduction to a book on the war neuroses (1919*d*), *RSE*, **17**, 202 ff.]

2 [Freud had, in fact, more than a dozen years of active life before him when he wrote this. See below, p. 63.]

well in the early days when he was still an analyst, that neuroses have no peculiar content which belongs exclusively to them but that neurotics break down at the same difficulties that are successfully overcome by normal people. This discovery was very far from being a disappointment. It was in complete harmony with another one: that the depth psychology revealed by psychoanalysis was in fact the psychology of the normal mind. Our path had been like that of chemistry: the great qualitative differences between substances were traced back to quantitative variations in the proportions in which the same elements were combined. [56]

In the Oedipus complex the libido was seen to be attached to the image of the parental figures. But earlier there was a period in which there were no such objects. There followed from this fact the concept (of fundamental importance for the libido theory) of a state in which the subject's libido filled his own ego and had that for its object. This state could be called *narcissism* or self-love. A moment's reflection showed that this state never completely ceases. All through the subject's life his ego remains the great reservoir of his libido, from which object cathexes are sent out and into which the libido can stream back again from the objects.[1] Thus narcissistic libido is constantly being transformed into object libido, and *vice versa*. An excellent instance of the length to which this transformation can go is afforded by the state of being in love, whether in a sexual or sublimated manner, which goes so far as involving a sacrifice of the self. Whereas hitherto in considering the process of repression attention had been paid to only what was repressed, these ideas made it possible to form a correct estimate of the repressing forces too. It had been said that repression was set in action by the drives to self-preservation [*Selbsterhaltungstrieben*][T] operating in the ego (the 'ego drives' [*Ichtrieben*]) and that it was brought to bear upon the libidinal drives. But since the drives to self-preservation were now recognized as also being of a libidinal nature, as being narcissistic libido, the process of repression was seen to be a process occurring within the libido itself; narcissistic libido was opposed to object libido, the interest of self-preservation was defending itself against the demands of object love, and therefore against the demands of sexuality in the narrower sense as well. *Selbsterhaltung*

There is no more urgent need in psychology than for a securely founded theory of the drives on which it might then be possible to build [57]

1 [A discussion of this can be found in Appendix B to *The Ego and the Id* (1923*b*), *RSE*, **19**, 56 ff.]

further.[1] Nothing of the sort exists, however, and psychoanalysis is driven to making tentative efforts towards some such theory. It began by drawing a contrast between the ego drives (the drive to self-preservation, hunger) and the libidinal drives (love), but later replaced it with a new contrast between narcissistic and object libido. This was clearly not the last word on the subject; biological considerations seemed to make it impossible to remain content with assuming the existence of only a single class of drives.

In the works of my later years (*Beyond the Pleasure Principle* [1920*g*], *Group Psychology and the Analysis of the Ego* [1921*c*] and *The Ego and the Id* [1923*b*]), I have given free rein to the inclination, which I kept down for so long, to speculation, and I have also contemplated a new solution to the problem of the drives. I have combined the drives to self-preservation and to the preservation of the species under the concept of *Eros* and have contrasted with it a *drive to death* or *destruction* [*Todes– oder Destruktionstrieb*] which works in silence. Drive in general is regarded as a kind of elasticity of living things, an impulsion towards the restoration of a situation which once existed but was brought to an end by some external disturbance. This essentially conservative character of drives is exemplified by the phenomena of the *compulsion to repeat* [*Wiederholungszwanges*][T]. The picture which life presents to us is the result of the concurrent and mutually opposing action of Eros and the death drive.

Zwang

It remains to be seen whether this construction will turn out to be serviceable. Although it arose from a desire to fix some of the most important theoretical ideas of psychoanalysis, it goes far beyond psychoanalysis. I have repeatedly heard it said contemptuously that it is impossible to take a science seriously whose most general concepts are as lacking in precision as those of libido and of drive in psychoanalysis. But this reproach rests on a complete misconception of the facts. Clear basic concepts and sharply drawn definitions are only possible in the human sciences[2] insofar as the latter seek to fit a region of facts into the frame of a logical system. In the natural sciences, of which psychology
[58] is one, such clear-cut general concepts are superfluous and indeed impossible. Zoology and botany did not start from correct and adequate definitions of an animal and a plant; to this very day biology has been unable to give any certain meaning to the concept of life. Physics itself,

1 [Some account of the development of Freud's views on the drives can be found in the Editors' Note to 'Drives and their Vicissitudes' (1915*c*), *RSE*, **14**, 100 ff.]

2 [*Geisteswissenschaften*. The term is roughly equivalent to the 'Humanities'.]

indeed, would never have made any advance if it had had to wait until its concepts of matter, force, gravitation, and so on, had reached the desirable degree of clarity and precision. The basic ideas or most general concepts in any of the disciplines of science are always left indeterminate at first and are only explained to begin with by reference to the realm of phenomena from which they were derived; it is only by means of a progressive analysis of the material of observation that they can be made clear and can find a significant and consistent meaning.[1] I have always felt it as a gross injustice that people have refused to treat psychoanalysis like any other science. This refusal found an expression in the raising of the most obstinate objections. Psychoanalysis was constantly reproached for its incompleteness and insufficiencies; though it is plain that a science based upon observation has no alternative but to work out its findings piecemeal and to solve its problems step by step. Again, when I endeavoured to obtain for the sexual function the recognition which had so long been withheld from it, psychoanalytic theory was branded as 'pan-sexualism'. And when I laid stress on the hitherto neglected importance of the part played by the accidental impressions of early youth, I was told that psychoanalysis was denying constitutional and hereditary factors – a thing which I had never dreamt of doing. It was a case of contradiction at any price and by any methods.

I had already made attempts at earlier stages of my work to arrive at some more general points of view on the basis of psychoanalytic observation. In a short essay, 'Formulations on the Two Principles of Mental Functioning' [1911*b*], I drew attention (and there was, of course, nothing original in this) to the domination of the *pleasure–unpleasure principle* in mental life and to its displacement by what is called the *reality principle*. Later on [in 1915] I made an attempt to produce a 'metapsychology'. By this I meant a method of approach according to which every mental process is considered in relation to three coordinates, which I described [59]
as *dynamic*, *topographical* and *economic* respectively; and this seemed to me to represent the furthest goal that psychology could attain. The attempt remained no more than a torso; after writing two or three papers – 'Drives and their Vicissitudes' [1915*c*], 'Repression' [1915*d*], 'The Unconscious' [1915*e*], 'Mourning and Melancholia' [1916–17*g* [1915]], etc. – I broke off, wisely perhaps, since the time for theoretical predications of this kind had not yet come.[2] In my latest speculative works I have set

1 [The whole of the remainder of this paragraph was added in 1935.]

2 [As has been shown by Ernest Jones (1955, 209), all these papers were, in fact, written in 1915, together with seven others which have disappeared (apart from a draft version of one of them, Freud, 1985*a* [1915]). See the Editors' Introduction to *Papers on Metapsychology*, *RSE*, **14**, 93 ff.]

about the task of dissecting our mental apparatus [*seelischen Apparat . . . zu gliedern*] on the basis of the analytic view of pathological facts and have divided it into an *ego* [*Ich*], an *id* [*Es*] and a *superego* [*Über-Ich*][T].[1] The superego is the heir to the Oedipus complex and represents the ethical standards of mankind.

I should not like[2] to create an impression that during this last period of my work I have turned my back upon patient observation and have abandoned myself entirely to speculation. I have on the contrary always remained in the closest touch with the analytic material and have never ceased working at detailed points of clinical or technical importance. Even when I have moved away from observation, I have carefully avoided any contact with philosophy proper. This avoidance has been greatly facilitated by constitutional incapacity. I was always open to the ideas of G. T. Fechner and have followed that thinker upon many important points.[3] The large extent to which psychoanalysis coincides with the philosophy of Schopenhauer – not only did he assert the dominance of the emotions and the supreme importance of sexuality but he was even aware of the mechanism of repression – is not to be traced to
[60] my acquaintance with his teaching. I read Schopenhauer very late in my life. Nietzsche, another philosopher whose guesses and intuitions often agree in the most astonishing way with the laborious findings of psychoanalysis, was for a long time avoided by me on that very account; I was less concerned with the question of priority than with keeping my mind unembarrassed [*meiner Unbefangenheit*][t].

The neuroses were the first subject of analysis, and for a long time they were the only one. No analyst could doubt that medical practice was wrong in separating those disorders from the psychoses and in attaching them to the organic nervous diseases. The theory of the neuroses belongs to psychiatry and is indispensable as an introduction to it. It would seem, however, that the analytic study of the *psychoses* is impracticable owing to its lack of therapeutic results. Mental patients are as a rule without the capacity for forming a positive transference, so that the principal instrument of analytic technique is inapplicable to them. There are nevertheless a number of methods of approach to be found. Transference is often not so completely absent but that it can be

1 *The Ego and the Id* [1923*b*; *RSE*, **19**, 11 ff.].

2 [This paragraph was printed in small type in the 1925, 1928 and 1948 editions.]

3 [In particular Fechner's influence appears in the 'principle of constancy' (cf. *Beyond the Pleasure Principle*, 1920*g*; ibid., **18**, 8–9) and in the concept of mental topography (cf. *The Interpretation of Dreams*, 1900*a*; ibid., **5**, 478–9). See also some passages in Chapter IV of Freud's book on *Jokes* (1905*c*), ibid., **8**.]

used to a certain extent; and analysis has achieved undoubted successes with cyclical depressions, light paranoic modifications and partial schizophrenias. It has at least been a benefit to science that in many cases the diagnosis can oscillate for quite a long time between assuming the presence of a psychoneurosis or of a dementia praecox; for therapeutic attempts initiated in such cases have resulted in valuable discoveries before they have had to be broken off. But the chief consideration in this connection is that so many things that in the neuroses have to be laboriously fetched up from the depths are found in the psychoses on the surface, visible to every eye. For that reason the best subjects for the demonstration of many of the assertions of analysis are provided by the psychiatric clinic. It was thus bound to happen before long that analysis would find its way to the objects of psychiatric observation. I was able very early (1896) to establish in a case of paranoid dementia the presence of the same aetiological factors and the same emotional complexes as in the neuroses.[1] Jung [1907] explained some most puzzling stereotypies in dements by bringing them into relation with the patients' life histories; [61]
Bleuler [1906*b*] demonstrated the existence in various psychoses of mechanisms like those which analysis had discovered in neurotics. Since then analysts have never relaxed their efforts to come to an understanding of the psychoses. Especially since it has been possible to work with the concept of narcissism, they have managed, now in this place and now in that, to get a glimpse beyond the wall. Most of all, no doubt, was achieved by Abraham [1912] in his elucidation of the melancholias. It is true that in this sphere all our knowledge is not yet converted into therapeutic power; but the mere theoretical gain is not to be despised, and we may be content to wait for its practical application. In the long run even the psychiatrists cannot resist the convincing force of their own clinical material. At the present time German psychiatry is undergoing a kind of 'peaceful penetration' by analytic views. While they continually declare that they will never be psychoanalysts, that they do not belong to the 'orthodox' school or agree with its exaggerations, and in particular that they do not believe in the predominance of the sexual factor, nevertheless the majority of the younger workers take over one piece or another of analytic theory and apply it in their own fashion to the material. All the signs point to the proximity of further developments in the same direction.

1 [In Section III of Freud's second paper on 'The Neuropsychoses of Defence' (1896*b*), *RSE*, **3**, 185 ff.]

VI

[62] I now watch from a distance the symptomatic reactions that are accompanying the introduction of psychoanalysis into the France which was for so long refractory. It seems like a reproduction of something I have lived through before, and yet it has peculiarities of its own. Objections of incredible simplicity are raised, such as that French sensitiveness is offended by the pedantry and crudity of psychoanalytic terminology. (One cannot help being reminded of Lessing's immortal Chevalier Riccaut de la Marlinière.[1]) Another comment has a more serious ring (a professor of psychology at the Sorbonne did not think it beneath him): the whole mode of thought of psychoanalysis, so he declared, is inconsistent with the *génie latin*. Here the Anglo-Saxon allies of France, who count as supporters of analysis, are explicitly thrown over. Anyone hearing the remark would suppose that psychoanalysis had been the favourite child of the *génie teutonique* and had been clasped to its heart from the moment of birth.

In France the interest in psychoanalysis began among the men of letters. To understand this, it must be borne in mind that from the time of the writing of *The Interpretation of Dreams* psychoanalysis ceased to be a purely medical subject. Between its appearance in Germany and in France lies the history of its numerous applications to departments of literature and of aesthetics, to the history of religions and to prehistory, to mythology, to folklore, to education, and so on. None of these things has much to do with medicine; in fact, it is only through psychoanalysis that they are connected with it. I have no business, therefore, to go into them in detail in these pages.[2]

[63] I cannot pass them over completely in silence, however, for, on the one hand, they are essential to a correct appreciation [*Vorstellung*] of the nature and value of psychoanalysis, and, on the other hand, I have, after all, undertaken to give an account of my life-work. The beginnings of the majority of these applications of psychoanalysis can be found in

1 [The comic French soldier of fortune in *Minna von Barnhelm* who is amazed when his sharp practice at cards is described as cheating: 'Comment, Mademoiselle? Vous appelez cela "cheating"? Corriger la fortune, l'enchaîner sous ses doigts, être sûr de son fait – ('What, Mademoiselle? You call that "cheating"? Correcting Fortune, having it at one's finger ends, knowing just what one is about') – do the Germans call that "cheating"? Cheating! Oh, what a poor language, what a crude language German must be!']

2 [The present work, it may be remembered, originally formed part of a series of *medical* autobiographies.]

my works. Here and there I have gone a little way along the path in order to gratify my non-medical interests. Later on, others (not only doctors, but specialists in the various fields as well) have followed in my tracks and penetrated far into the different subjects. But since my programme limits me to a mention of my own share in these applications of psychoanalysis, I can give only a quite inadequate picture of their extent and importance.

A number of suggestions came to me out of the Oedipus complex, the ubiquity of which gradually dawned on me. The poet's choice, or his invention, of such a terrible subject seemed puzzling; and so too did the overwhelming effect of its dramatic treatment, and the general nature of such tragedies of destiny [*Schicksalstragödie*]. But all of this became intelligible when one realized that a universal law of mental life had here been captured in all its emotional significance. Fate and the oracle were no more than materializations of an internal necessity; and the fact of the hero's sinning without his knowledge and against his intentions was evidently a right expression of the *unconscious* nature of his criminal tendencies. From understanding this tragedy of destiny it was only a step further to understanding a tragedy of character – *Hamlet*, which had been admired for three hundred years without its meaning being discovered or its author's motives guessed. It could scarcely be a chance that this neurotic creation of the poet should have come to grief, like his countless fellows in the real world, over the Oedipus complex. For Hamlet was faced with the task of taking vengeance on another for the two deeds which are the subject of the Oedipus desires; and before that task his arm was paralysed by his own obscure sense of guilt. Shakespeare wrote *Hamlet* very soon after his father's death.[1] The

1 [*Footnote added 1935:*] This is a construction which I should like explicitly to withdraw. I no longer believe that William Shakespeare the actor from Stratford was the author of the works which have so long been attributed to him. Since the publication of J. T. Looney's volume '*Shakespeare' Identified* [1920], I am almost convinced that in fact Edward de Vere, Earl of Oxford, is concealed behind this pseudonym. – [When, in 1935, the English translator received the draft of this additional footnote, he was so much taken aback that he wrote to Freud asking him to reconsider it – not on the ground of the truth or otherwise of the theory, but of the effect the note was likely to have on the average English reader, particularly in view of the unfortunate name of the author of the book referred to. Freud's reply was most forbearing, as an excerpt from a translation of his letter will show. The letter (addressed to James Strachey) is dated August 29, 1935. '. . . As regards the Shakespeare–Oxford note, your proposal puts me in the unusual situation of showing myself as an opportunist. I cannot understand the English attitude to this question: Edward de Vere was certainly as good an Englishman as Will Shakspere [*sic*]. But since the matter is so remote from analytic interest, and since you set so much store on my being reticent, I am ready to cut out the note, or merely to insert a sentence such as "For particular reasons I no longer wish to lay emphasis on this point". Decide on this yourself. On the other hand, I should be glad to have the whole note retained in the American edition. The same sort

[64] suggestions made by me for the analysis of this tragedy[1] were fully worked out later on by Ernest Jones [1910*a*]. And the same example was afterwards used by Otto Rank as the starting point for his investigation of the choice of material made by dramatists [*dramatischen Dichter*]. In his large volume on the incest theme (Rank, 1912*c*) he was able to show how often imaginative writers [*Dichter*] have taken as their subject the themes of the Oedipus situation, and traced in the different literatures of the world the way in which the material has been transformed, modified and softened.

It was tempting to go on from there to an attempt at an analysis of poetic [*dichterischen*] and artistic creation in general. The realm of imagination was seen to be a 'reservation' made during the painful transition from the pleasure principle to the reality principle in order to provide a substitute for drive satisfactions which had to be given up in real life. The artist, like the neurotic, had withdrawn from an unsatisfying reality into this world of imagination; but, unlike the neurotic, he knew how to find a way back from it and once more to get a firm foothold in reality. His creations, works of art, were the imaginary

Phantasie [65] satisfactions [*Phantasiebefriedigungen*][T] of unconscious wishes, just as dreams are; and like them they were in the nature of compromises, since they too were forced to avoid any open conflict with the forces of repression [*mit den Mächten der Verdrängung*]. But they differed from the asocial, narcissistic products of dreaming in that they were calculated to arouse sympathetic interest in other people and were able to evoke and to satisfy the same unconscious wishful impulses in them too. Besides this, they made use of the perceptual pleasure of formal beauty as what I have called an 'incentive bonus'. What psychoanalysis was able to do was to take the interrelations between the impressions of the artist's life, his chance experiences and his works, and from them to construct his [mental] constitution and the drive impulses at work in it – that is to say, that part of him which he shared with all men.[2] With this aim in view, for instance, I made Leonardo da Vinci the subject of a study [1910*c*; *RSE*, **11**, 61 ff.], which is based on a single memory of childhood related by him and which aims chiefly at explaining his picture of 'The Madonna and

of narcissistic defence need not be feared over there. . . .' Accordingly, in the English edition of 1935 the footnote reads: 'I have particular reasons for no longer wishing to lay any emphasis upon this point.']

1 [Freud put them forward in the first edition of *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 234 ff. Cf. a footnote to the *Outline* (1940*a*), ibid., **23**, 173 *n.* 1, where an editorial addition gives further references.]

2 [Cf. 'Creative Writers and Daydreaming' (1908*e*), ibid., **9**, 123.]

Child with St Anne'. Since then my friends and pupils have undertaken numerous analyses of artists and their works. It does not appear that the enjoyment of a work of art is spoilt by the knowledge gained from such an analysis. The layman may perhaps expect too much from analysis in this respect, for it must be admitted that it throws no light on the two problems which probably interest him the most. It can do nothing towards elucidating the nature of the artistic gift, nor can it explain the means by which the artist works – artistic technique.

I was able to show from a short story by W. Jensen called *Gradiva* [1907*a*; *RSE*, **9**, 5 ff.], which has no particular merit in itself, that invented dreams can be interpreted in the same way as real ones and that the unconscious mechanisms familiar to us in the 'dream-work' are thus also operative in the processes of imaginative writing. My book on *Jokes and their Relation to the Unconscious* [1905*c*] was a side-issue directly derived from *The Interpretation of Dreams*. The only friend of mine who was at that time interested in my work remarked to me that my interpretations of dreams often impressed him as being like jokes.[1] In order to throw some light on this impression, I began to investigate [66] jokes and found that their essence lay in the technical methods employed in them, and that these were the same as the means used in the 'dream-work' – that is to say, condensation [*Verdichtung*], displacement [*Verschiebung*], the representation of a thing by its opposite or by something very small, and so on. This led to an economic enquiry into the origin of the high degree of pleasure obtained from hearing a joke. And to this the answer was that it was due to the momentary suspension of the expenditure of energy upon maintaining repression [*Verdrängung*], owing to the attraction exercised by the offer of a bonus of pleasure (*fore-pleasure*).

I myself set a higher value on my contributions to the psychology of religion, which began with the establishment of a remarkable similarity between obsessive actions [*Zwangshandlungen*] and religious practices or ritual (1907*b*). Without as yet understanding the deeper connections, I described the obsessional neurosis [*Zwangsneurose*] as a distorted private religion and religion as a kind of universal obsessional neurosis. Later on, in 1912, Jung's forcible indication of the far-reaching analogies between the mental products of neurotics and of primitive peoples led me to turn my attention to that subject. In four essays, which were collected into a book with the title of *Totem and Taboo* [1912–13*a*], I showed

1 [This was Wilhelm Fliess. See a footnote to *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 265.]

that the horror of incest was even more marked among primitive than among civilized races and had given rise to very special measures of defence against it. I examined the relations between taboo prohibitions (the earliest form in which moral restrictions make their appearance) and emotional ambivalence; and I discovered under the primitive scheme of the universe known as 'animism' the principle of the over-estimation of the importance of psychical reality – the belief in 'the omnipotence of thoughts' – which lies at the root of magic as well. I developed the comparison with the obsessional neurosis at every point, and showed how many of the postulates of primitive mental life are still in force in that remarkable illness. Above all, however, I was attracted by totemism, the first system of organization in primitive tribes, a system in which the beginnings of social order are united with a rudimentary religion and the implacable domination of a small number of taboo prohibitions. The being that is revered is ultimately always an animal, from which the clan also claims to be descended. Many indications
[67] pointed to the conclusion that every race, even the most highly developed, had once passed through the stage of totemism.

The chief literary sources[1] of my studies in this field were the well-known works of J. G. Frazer (*Totemism and Exogamy* and *The Golden Bough*), a mine of valuable facts and opinions. But Frazer effected little towards elucidating the problems of totemism; he had several times fundamentally altered his views on the subject, and the other ethnologists and prehistorians seemed in equal uncertainty and disagreement. My starting point was the striking correspondence between the two taboo ordinances of totemism (not to kill the totem and not to have sexual relations with any woman of the same totem clan) and the two elements of the Oedipus complex (getting rid of the father and taking the mother to wife). I was therefore tempted to equate the totem animal with the father; and, in fact, primitive peoples themselves do this explicitly, by honouring it as the forefather of the clan. There next came to my help two facts from psychoanalysis, a lucky observation of a child made by Ferenczi [1913*a*], which enabled me to speak of an 'infantile return of totemism', and the analysis of early animal phobias in children, which so often showed that the animal was a substitute for the father, a substitute on to which the fear of the father derived from the Oedipus complex had been displaced. Not much was lacking to enable me to recognize the killing of the father as the nucleus of totemism and the starting point in the formation of religion.

1 [This paragraph and the following one were printed in small type in the 1925, 1928 and 1948 editions.]

This missing element was supplied when I became acquainted with W. Robertson Smith's work, *The Religion of the Semites* [1894]. Its author (a man of genius who was both a physicist and an expert in biblical researches) introduced the so-called 'totem meal' as an essential part of the totemic religion. Once a year the totem animal, which was at other times regarded as sacred, was solemnly killed in the presence of all the members of the clan, was devoured and was then mourned over. The mourning was followed by a great festival. When I further took into account Darwin's conjecture that men originally lived in hordes, each under the domination of a single powerful, violent and jealous male, there rose before me out of all these components the following hypothesis, or, I would rather say, vision. The father of the primal horde, since he was an unlimited despot, had seized all the women for himself; his sons, being dangerous to him as rivals, had been killed or driven away. One day, however, the sons came together and united to overwhelm, kill and devour their father, who had been their enemy but also their ideal. After the deed they were unable to take over their heritage since they stood in one another's way. Under the influence of failure and remorse they learnt to come to an agreement among themselves; they banded themselves into a clan of brothers by the help of the ordinances of totemism, which aimed at preventing a repetition of such a deed, and they jointly undertook to forgo the possession of the women on whose account they had killed their father. They were then driven to finding strange women, and this was the origin of the exogamy which is so closely bound up with totemism. The totem meal was the festival commemorating the fearful deed from which sprang man's sense of guilt (or 'original sin') and which was the beginning at once of social organization, of religion and of ethical restrictions. [68]

Now whether or not we suppose that such a possibility was a historical event, it brings the formation of religion within the circle of the father complex and bases it upon the ambivalence which dominates that complex. After the totem animal had ceased to serve as a substitute for him, the primal father, at once feared and hated, revered and envied, became the prototype of God himself. The son's rebelliousness and his affection for his father struggled against each other through a constant succession of compromises [*Kompromissbildungen*], which sought on the one hand to atone for the act of parricide and on the other to consolidate the advantages it had brought. This view of religion throws a particularly clear light upon the psychological basis of Christianity, in which, as we know, the ceremony of the totem meal still survives with but little

distortion, in the form of Communion. I should like explicitly to mention that this last observation was not made by me but is to be found in the works of Robertson Smith and Frazer.

Theodor Reik and G. Róheim, the ethnologist, have taken up the line of thought which I developed in *Totem and Taboo* and, in a series of
[69] important works, have extended it, deepened it, or corrected it. I myself have since returned to it more than once, in the course of my investigations into the 'unconscious sense of guilt' [*unbewusste Schuldgefühl*] (which also plays such an important part among the motives of neurotic suffering) and in my attempts at forming a closer connection between social psychology and the psychology of the individual.[1] I have moreover made use of the idea of an archaic heritage from the 'primal horde' epoch of mankind's development in explaining susceptibility to hypnosis.[2]

I have taken but little direct part in certain other applications of psychoanalysis, though they are nonetheless of general interest. It is only a step from the phantasies of individual neurotics to the imaginative creations [*Phantasieschopfüngen*] of groups [*Massen*][T] and peoples as we find them in myths, legends and fairy tales. Mythology became the special province of Otto Rank; the interpretation of myths, the tracing of them back to the familiar unconscious complexes of early childhood, the replacing of astral explanations with a discovery of human motives, all of this is to a large extent due to his analytic efforts. The subject of symbolism, too, has found many students among my followers. Symbolism has brought psychoanalysis many enemies; many enquirers with unduly prosaic minds have never been able to forgive it the recognition of symbolism, which followed from the interpretation of dreams. But analysis is guiltless of the discovery of symbolism, for it had long been known in other regions of thought (such as folklore, legends and myths) and plays an even larger part in them than in the 'language of dreams'.

I myself have contributed nothing to the application of analysis to education. It was natural, however, that the analytic discoveries about the sexual life and mental development of children should attract the attention of educators and make them see their problems in a new light. Dr Oskar Pfister,[3] a Protestant pastor at Zürich, led the way as a tireless pioneer along these lines, nor did he find the practice of analysis

1 *The Ego and the Id* [1923*b*; *RSE*, **19**, 11 ff.] and *Group Psychology and the Analysis of the Ego* [1921*c*; ibid., **18**, 67].

2 [See ibid., **18**, 116 ff.]

3 [Cf. Freud's Introduction to a book of his (1913*b*), ibid., **12**, 327.]

incompatible with the retention of his religion, though it is true that this [70]
was of a sublimated kind. Among the many others who worked alongside of him I may mention Frau Dr Hug-Hellmuth and Dr S. Bernfeld, both of Vienna.[1] The application of analysis to the prophylactic upbringing of healthy children and to the correcting of those who, though not actually neurotic, have deviated from the normal course of development has led to one consequence which is of practical importance. It is no longer possible to restrict the practice of psychoanalysis to doctors and to exclude laymen from it. In fact, a doctor who has not been through a special training [*Ausbildung*] is, in spite of his diploma, a layman in analysis, and a non-doctor who has been suitably trained can, with occasional reference [*Anlehnung*] to a doctor, carry out the analytic treatment not only of children but also of neurotics.[2]

By a process of development against which it would have been useless to struggle, the word 'psychoanalysis' has itself become ambiguous. While it was originally the name of a particular therapeutic method, it has now also become the name of a science – the science of unconscious mental processes. By itself this science is seldom able to deal with a problem completely, but it seems destined to give valuable contributory help in the most varied regions of knowledge. The sphere of application of psychoanalysis extends as far as that of psychology, to which it forms a complement of the greatest moment.

Looking back, then, over the patchwork of my life's labours, I can say that I have made many beginnings and thrown out many suggestions. Something will come of them in the future, though I cannot myself tell whether it will be much or little. I can, however, express a hope that I have opened up a pathway for an important advance in our knowledge.[3]

1 [*Footnote added 1935:*] Since these words were written child analysis in particular has gained a powerful momentum owing to the work of Mrs Melanie Klein and of my daughter, Anna Freud.

2 [See *The Question of Lay Analysis* (*1926e*), below, p. 163 ff.]

3 [This last sentence was added in 1935.]

APPENDIX

BIBLIOGRAPHIC NOTES[1]

I pass over the histological and clinical works from the period when I was a student and *Dozent*. The later publications in book form are enumerated in chronological order:

[. . .]

My many papers on psychoanalysis and its application were published in book form in 1906–22, in five volumes, in the *Sammlung kleiner Schriften zur Neurosenlehre*.[2] They originate mostly from the journals that I myself publish (*Internationale Zeitschrift für Psychoanalyse* and *Imago*).

In recent years the Internationaler Psychoanalytischer Verlag in Vienna undertook a complete edition of my works [*Gesammelte Schriften*], four volumes of which are currently available (in 1924). A Spanish edition of my complete works (*Obras completas*), prepared by López-Ballesteros of R. Castillo's publishing house in Madrid, already consists of six volumes. The majority of the books listed in this Bibliography, and many papers, have become accessible to non-German readers through translations (e.g. *Everyday Life* [Freud, 1901*b*]: Russian, English, Dutch, Polish, Hungarian, French, Spanish; *Introductory Lectures* [Freud, 1916–17*a*]: American, English, Dutch, French, Italian, Spanish, Russian).

1 [We owe to Ilse Grubrich-Simitis the realization that the original German edition of Freud's *Autobiographical Study* included a select 'Bibliography' of his works (circa 1924) which was not included in any of the subsequent editions. The Bibliography, which appeared at the end of Freud's article (p. 52), included brief discursive notes. These notes were reprinted in the German edition of Grubrich-Simitis's (1993) book, *Zurück zu Freuds Texten*, p. 290. The present translation, by Mark Solms, is the first into English.

The Bibliography itself was never reprinted. It begins with the 1884 monograph 'Über Coca' and ends with *The Ego and the Id*, in some cases including several editions. Freud's brief notes introduce and conclude the listing.]

2 ['Collection of Shorter Writings on the Theory of the Neuroses'.]

POSTSCRIPT

(1935)

The editor of this series of autobiographical studies did not, so far as I know, consider the possibility that after a certain lapse of time a sequel might be written to any of them; and it may be that such an event has occurred only in the present instance. I am undertaking the task since my American publisher[1] desires to issue the little work in a new edition. It first appeared in America in 1927 (published by Brentano) under the title of *An Autobiographical Study*, but it was injudiciously brought out in the same volume as another essay of mine which gave its title, *The Problem of Lay-Analyses*, to the whole book and so obscured the present work. [71]

Two themes run through these pages: the story of my life and the history of psychoanalysis. They are intimately interwoven. This *Autobiographical Study* shows how psychoanalysis came to be the whole content of my life and rightly assumes that no personal experiences of mine are of any interest in comparison to my relations with that science.

Shortly before I wrote this study it seemed as though my life would soon be brought to an end by the recurrence of a malignant disease; but surgical skill saved me in 1923 and I was able to continue my life and my work, though no longer in freedom from pain. In the period of more than ten years that has passed since then, I have never ceased my analytic work nor my writing – as is proved by the completion of the twelfth volume of the German edition of my collected works.[2] But I myself find that a significant change has come about. Threads which in the course of my development had become intertangled have now begun to separate; interests which I had acquired in the later part of my life have receded, while the older and original ones become prominent once more. It is true that in this last decade I have carried out some important pieces of analytic work, such as the revision of the problem of anxiety

1 [W. W. Norton & Co., of New York.]

2 [The *Gesammelte Schriften* (1924–34).]

[*Angstproblems*] in my book *Inhibitions, Symptoms and Anxiety* (1926*d*)
[72] or the simple explanation of sexual 'fetishism' which I was able to make a year later (1927*e*). Nevertheless, it would be true to say that, since I put forward my hypothesis of the existence of two classes of drives (Eros and the death drive) and since I proposed a division of the mental personality into an ego, a superego and an id (1923*b*), I have made no further decisive contributions to psychoanalysis: what I have written on the subject since then either has been unessential or would soon have been supplied by someone else. This circumstance is connected with an alteration in myself, with what might be described as a phase of regressive development. My interest, after making a lifelong detour through the natural sciences, medicine and psychotherapy, returned to the cultural problems which had fascinated me long before, when I was a youth scarcely old enough for thinking. At the very climax of my psychoanalytic work, in 1912, I had already attempted in *Totem and Taboo* to make use of the newly discovered findings of analysis in order to investigate the origins of religion and morality. I now carried this work a stage further in two later essays, *The Future of an Illusion* (1927*c*) and *Civilization and its Discontents* (1930*a*). I perceived ever more clearly that the events of human history, the interactions between human nature, cultural development and the precipitates of primaeval experiences (the most prominent example of which is religion) are no more than a reflection of the dynamic conflicts between the ego, the id and the superego, which psychoanalysis studies in the individual – are the very same processes repeated upon a wider stage. In *The Future of an Illusion* I expressed an essentially negative valuation of religion. Later, I found a formula which did better justice to it: while granting that its power lies in the truth which it contains, I showed that that truth was not a material but a historical truth. [1939*a*; Essay III, Part II (G); *RSE*, **23**.]

These studies, which, though they originate in psychoanalysis, stretch far beyond it, have perhaps awakened more public sympathy than psychoanalysis itself. They may have played a part in creating the short-lived illusion that I was among the writers to whom a great nation like Germany was ready to listen. It was in 1929 that, with words no less pregnant than friendly, Thomas Mann, one of the acknowledged spokes-
[73] men of the German people, found a place for me in the history of modern thought.[1] A little later my daughter Anna, acting as my proxy,

1 [Mann gave a lecture at the University of Munich with the title '*Die Stellung Freuds in der modernen Geistesgeschichte*', which may be translated 'Freud's Place in the History of Modern Thought'.]

was given a civic reception in the Rathaus at Frankfurt-am-Main on the occasion of my being awarded the Goethe Prize for 1930.[1] This was the climax of my life as a citizen. Soon afterwards the boundaries of our country narrowed and the nation would know no more of us.

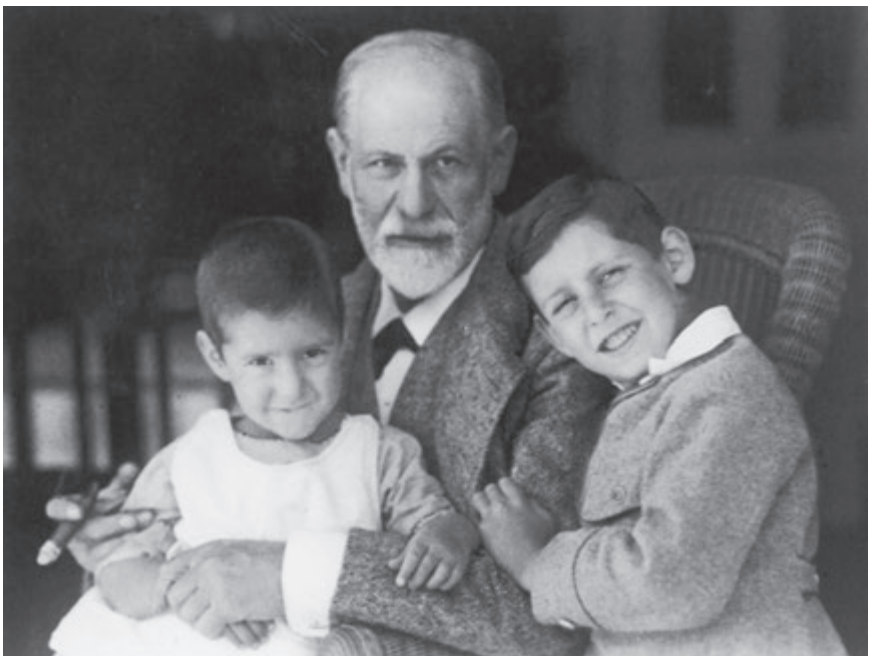
And here I may be allowed to break off these autobiographical notes. The public has no claim to learn any more of my personal affairs – of my struggles, my disappointments and my successes. I have, in any case, been more open and frank in some of my writings (such as *The Interpretation of Dreams* and *The Psychopathology of Everyday Life*) than people usually are who describe their lives for their contemporaries or for posterity. I have had small thanks for it, and from my experience I cannot recommend anyone to follow my example.

I must add a few more words on the history of psychoanalysis during the last decade. There can no longer be any doubt that it will continue; it has proved its capacity to survive and to develop both as a branch of knowledge and as a therapeutic method. The number of its supporters (organized into the International Psychoanalytical Association) has considerably increased. In addition to the older local groups (in Vienna, Berlin, Budapest, London, Holland, Switzerland and Russia[2]), societies have since been formed in Paris and Calcutta, two in Japan, several in the United States, and quite recently one each in Jerusalem and South Africa and two in Scandinavia. Out of their own funds these local societies support (or are in process of forming) training institutes, in which instruction in the practice of psychoanalysis is given according to a uniform plan, and out-patient clinics in which experienced analysts as well as students give free treatment to patients of limited means. Every other year the members of the International Psychoanalytical Association hold a Congress at which scientific papers are read and questions of organization decided. The thirteenth of these congresses (which I myself can no longer attend) took place at Lucerne in 1934. From a core of interests that are common to all members of the Association, their [74]
work radiates in many different directions. Some lay most stress upon clarifying and deepening our knowledge of psychology, while others are concerned with keeping in contact with medicine and psychiatry. From the practical point of view, some analysts have set themselves the task of bringing about the recognition of psychoanalysis at the universities and its inclusion in the medical curriculum, whereas others are content

1 [Cf. Freud, 1930*d* and 1930*e*; *RSE*, **21**.]

2 [In the German editions Russia was, no doubt accidentally (cf. p. 44 *n.* above), omitted from this list. The author approved of its inclusion in the English translation.]

to remain outside these institutions and will not allow that psychoanalysis is less important in the field of education than in that of medicine. It happens from time to time that an analytic worker may find himself isolated in an attempt to emphasize some single one of the findings or views of psychoanalysis at the expense of all the rest. Nevertheless, the whole impression is a satisfactory one – of serious scientific work carried on at a high level.



Freud with grandsons Heinz and Ernst in 1922

Freud with grandsons Heinz and Ernst in 1922

These were the sons of his deceased daughter, Sophie. In a letter to Katá and Lajos Lévy, shortly after the younger boy Heinz's death, Freud wrote: 'An enchanting little fellow, and I myself was aware of never having loved a human being, certainly never a child, so much. Unfortunately he was very weak, never entirely free of a temperature, one of those children whose mental development grows at the expense of its physical strength.'

2003 *PMC*, *Beyond the Pleasure Principle and Other Writings*, 151–240. (Tr. John Reddick.)

An extract from Chapter I of the original appeared in the Vienna *Neue Freie Presse* of February 21, 1926. A part of the first American translation was reprinted in the *Archives of Psychoanalysis*, **1** (1927), 461–521. All three of the translations were authorized by Freud, and, as Ernest Jones points out (1957, 139–40), the translators

of the last two prepared their work simultaneously, and in complete ignorance of each other's activities.

The present translation is a revised and corrected reprint of the *SE* version. On the translation of the terms '*Angst*' and '*Hemmung*', see *RSE*, **24**, 56–7 and 68.

[78] We know from Ernest Jones that this book was written in July, 1925, and that it was revised in December of the same year and published in the third week of the following February.

The topics with which it deals range over a wide field, and there are signs that Freud found an unusual difficulty in unifying the work. This is shown, for instance, in the way in which the same subject often comes up for discussion at more than one point in very similar terms, in the necessity under which Freud found himself of tidying up a number of separate questions in his 'Addenda', in the multiple revisions of the organization of the text in the original manuscript, and even in the actual title of the book. It is nevertheless true that – in spite of such important side-issues as the different classes of resistance, the distinction between repression and defence, and the relations between anxiety, pain and mourning – the problem of anxiety is its main theme. A glance at the list given in Appendix B (p. 155 below) will be enough to show how constantly present it was to Freud's mind from the beginning to the end of his psychological studies. Though on some aspects of the subject his opinions underwent little modification, on others, as he tells us in these pages, they were considerably altered. It may perhaps be of interest to trace, if only roughly, the history of these changes in two or three of the more important issues involved.

(*a*) ANXIETY AS TRANSFORMED LIBIDO

It was in the course of investigating the 'actual' neuroses that Freud first came upon the problem of anxiety, and his earliest discussions of it can be found in his first paper on the anxiety neurosis (1895*b*), *RSE*, **3**, and in the memorandum on the subject which he sent to Fliess a little earlier, probably in the summer of 1894 (Freud, 1950*a*, Draft E). At that time he was still largely under the influence of his neurological studies and he was deep in his attempt at expressing the data of psychology in physiological terms. In particular, following Fechner, he had taken as a fundamental postulate the 'principle of constancy', according to which there was an inherent tendency in the nervous system to reduce, or at least to keep constant, the amount of excitation present in it. When, therefore, he made the clinical discovery that in cases of anxiety neurosis it was always possible to discover some interference with the discharge of sexual tension, it was natural for him to conclude that the
[79] accumulated excitation was finding its way out in the transformed shape of anxiety. He regarded this as a purely physical process without any psychological determinants.

From the first the anxiety occurring in phobias or in obsessional neuroses raised a complication, for here the presence of psychological events could not be excluded. But, as regards the emergence of anxiety, the explanation remained the same. In these cases – in the psychoneuroses – the *reason* for the accumulation of undischarged excitation was a psychological one: repression. But what followed

was the same as in the 'actual' neuroses: the accumulated excitation (or libido) was transformed directly into anxiety.

Some quotations will show how loyally Freud maintained this view. In 'Draft E' (*c.* 1894), referred to above, he wrote: Anxiety arises 'by *transformation* out of the accumulated sexual tension'. In *The Interpretation of Dreams* (1900*a*): 'Anxiety is a libidinal impulse which has its origin in the unconscious and is inhibited by the preconscious.' (*RSE*, **4**, 300–1.) In *Gradiva* (1907*a*): 'The anxiety in anxiety dreams, like neurotic anxiety in general, . . . arises out of libido by the process of repression.' (Ibid., **9**, 47.) In the metapsychological paper on 'Repression' (1915*d*): After repression 'the quantitative portion [of the drive impulse – i.e. its energy] has not vanished, but has been transformed into anxiety'. (Ibid., **14**, 137.) Finally, as late as in 1920, Freud added in a footnote to the fourth edition of the *Three Essays*: 'One of the most important results of psychoanalytic research is this discovery that neurotic anxiety arises out of libido, that it is the product of a transformation of it, and that it is thus related to it in the same kind of way as vinegar is to wine.' (Ibid., **7**, 198 *n.* 1.) It is curious to note, however, that at quite an early stage Freud seems to have been assailed by doubts on the subject. In a letter to Fliess of November 14, 1897 (Freud, 1950*a*, Letter 75), he remarks, without any apparent connection with the rest of what he has been writing about: 'I have decided, then, henceforth to regard as separate factors what causes libido and what causes anxiety.' No further evidence is anywhere to be found of this isolated recantation. In the work before us Freud gave up the theory he had held for so long. He no longer regarded anxiety as transformed libido, but as a reaction on a particular model to situations of danger. [80]
But even here he still maintained (p. 125 below) that it was very possible that in the case of the anxiety neurosis 'what finds discharge in the generating of anxiety is precisely the surplus of unutilized libido'. This last relic of the old theory was to be abandoned a few years later. In a passage near the end of his discussion of anxiety in Lecture XXXII of his *New Introductory Lectures* (1933*a*), *RSE*, **22**, 83–4, he wrote that in the anxiety neurosis, too, the appearance of anxiety was a reaction to a traumatic situation: 'we shall no longer maintain that it is the libido itself that is turned into anxiety in such cases.'

(*b*) REALISTIC AND NEUROTIC ANXIETY

In spite of his theory that neurotic anxiety was merely transformed libido, Freud was from the first at pains to insist on the close relation between anxiety due to external and to internal (drive) dangers. In his first paper on the anxiety neurosis (1895*b*) he wrote: 'The psyche finds itself in the *affect* of anxiety if it feels unable to deal by appropriate reaction with a task (a danger) *approaching from outside*; it finds itself in the *neurosis* of anxiety if it notices that it is unable to even out the (sexual) excitation originating *from within* – that is to say, *it behaves as though it were projecting that excitation outwards*. The affect and its corresponding neurosis are firmly related to each other. The first is a reaction to an exogenous excitation, the second a reaction to the analogous endogenous one.' (Ibid., **3**, 100.)

This position, especially in connection with phobias, was elaborated later in many of Freud's writings – for instance, in the metapsychological papers on 'Repression' (1915*d*) and 'The Unconscious' (1915*e*), ibid., **14**, 137–9 and 161–3, and in

Lecture XXV of the *Introductory Lectures* (1916–17*a*), ibid., **16**. But it was difficult to maintain the sameness of the anxiety in the two classes of case so long as the direct derivation of anxiety from libido was insisted upon for the 'actual' neuroses. With the abandonment of this view and with the new distinction between automatic anxiety and anxiety as a signal, the whole situation was clarified and there ceased to be any reason for seeing a generic difference between neurotic and realistic anxiety.

(*c*) THE TRAUMATIC SITUATION AND SITUATIONS OF DANGER

[81] It adds to the difficulties of this book that the distinction between anxiety as a direct and automatic reaction to a trauma and anxiety as a signal of the danger of the approach of such a trauma, although touched on at several earlier points, is clinched only in the very last chapter. (A later and shorter account, given in Lecture XXXII of the *New Introductory Lectures* (1933*a*), *RSE*, **22**, may perhaps be found easier to grasp.)

The fundamental determinant of automatic anxiety is the occurrence of a traumatic situation; and the essence of this is an experience of helplessness on the part of the ego in the face of an accumulation of excitation, whether of external or of internal origin, which cannot be dealt with (pp. 121 f. and 146 f. below). Anxiety 'as a signal' is the response of the ego to the threat of the occurrence of a traumatic situation. Such a threat constitutes a situation of danger. Internal dangers change with the period of life (pp. 130–1), but they have a common characteristic, namely that they involve separation from, or loss of, a loved object, or a loss of its love (pp. 133–4) – a loss or separation which might in various ways lead to an accumulation of unsatisfied desires and so to a situation of helplessness. Though Freud had not brought all these factors together before, each of them has a long previous history.

The traumatic situation itself is clearly the direct descendant of the state of accumulated and undischarged tension in Freud's earliest writings on anxiety. Some of the accounts of it given here might be quotations from 1894 or 1895. For instance, 'suffering from a pain which will not stop or experiencing an accumulation of drive needs which cannot obtain satisfaction' on p. 149 below may be compared with 'a physical accumulation of excitation [. . . in] consequence of discharge being prevented', from 'Draft E' (Freud, 1950*a*). At this early period the accumulated excitations, it is true, were almost invariably thought of as libidinal, but not *quite* invariably. Later on in the same 'Draft E' is a sentence which points out that anxiety may be 'the sensation of the accumulation of another endogenous stimulus, the stimulus to breathing . . .; anxiety might therefore be employed for accumulated physical tension in general'. Again, in the 'Project' of 1895 (Freud, 1950*a*, Part I, Section 1) Freud enumerates the major needs which give rise to endogenous stimuli [82] calling for discharge – 'hunger, respiration, sexuality', and in a later passage (Part I, Section 11) remarks that in some conditions this discharge 'calls for an alteration in the external world (supply of nourishment, proximity of the sexual object)' which at early stages 'the human organism is incapable of bringing about'. To achieve that, 'extraneous help' is needed, which the child attracts by his screams. And here Freud comments on the 'initial helplessness of human beings'. There is a

similar reference in Part III, Section 1, of the same work to the necessity of attracting 'the attention of the helpful person (usually the wished-for object itself) to the child's longing and distressful state'. These passages seem to be an early hint at the situation of helplessness described here (pp. 120–3 below), in which the infant misses his mother – a situation that had been clearly stated in the footnote to the *Three Essays* (1905*d*) in which Freud explained a child's anxiety in the dark as being due to 'the absence of someone he loved' (*RSE*, **7**, 198 *n.* 1).

But this has taken us on to the question of the various specific dangers which are liable to precipitate a traumatic situation at different times of life. These are briefly: birth, loss of the mother as an object, loss of the penis, loss of the object's love, loss of the superego's love. The question of birth is dealt with in the next section and we have just mentioned some early references to the importance of separation from the mother. The danger of castration with its devastating effects is no doubt the most familiar of all these dangers. But it is worth recalling a footnote added in 1923 to the case history of 'Little Hans' (1909*b*), in which Freud deprecates the application of the name 'castration complex' to the other kinds of separation which the child must inevitably experience (ibid., **10**, 7 *n.* 3). We may possibly see in that passage a first hint at the concept of anxiety due to separation which comes into prominence here. The stress laid on the danger of losing the love of the loved object is explicitly related (on pp. 126–7 below) to the characteristics of female sexuality, which had only recently begun to occupy Freud's mind.[1] Finally, the danger of losing the love of the superego carries us back to the long-debated problems of the [83]
sense of guilt, which had been restated only shortly before in *The Ego and the Id* (1923*b*), *RSE*, **19**.

(*d*) ANXIETY AS A SIGNAL

As applied to unpleasure in general, this notion was a very old one of Freud's. In Section 6 of Part II of the 'Project' of 1895 (Freud, 1950*a*) there is an account of a mechanism by which the ego restricts the generation of painful experiences: 'By that means the release of unpleasure was quantitatively restricted, and its start was precisely a signal for the ego to set normal defence in action.' Similarly in *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 539, it is laid down that thinking must aim 'at restricting the development of affect in thought activity to the minimum required for acting as a signal'. In 'The Unconscious' (1915*e*), ibid., **14**, 162, the idea is already applied to anxiety. Discussing the appearance of 'substitutive ideas' in phobia, Freud writes: 'Excitation of any point in this outer structure must inevitably, on account of its connection with the substitutive idea, give rise to a slight development of anxiety; and this is now used as a signal to inhibit . . . the further progress of the development of anxiety.' Similarly, in Lecture XXV of the *Introductory Lectures*, the state of 'anxious expectancy' is described in one or two places as offering a 'signal' to prevent an outbreak of severe anxiety. From this it was not a long step

1 In his papers on 'The Dissolution of the Oedipus Complex' (1924*d*), *RSE*, **19**, 167 ff., and on the anatomical distinction between the sexes (1925*j*), ibid., **19**, 249 ff., Freud had begun to emphasize the differences between the sexual development of boys and girls and at the same time to insist on the fact that in both sexes the mother is the first love object. The history of this shift of emphasis in his views can be found discussed in the Editors' Note to the second of these two papers.

to the illuminating exposition in these pages. It may be remarked that in the present work too the concept is first introduced as a signal of 'unpleasure' (p. 82 below) and only subsequently as one of 'anxiety'.

(*e*) ANXIETY AND BIRTH

There remains the question of what it is that determines the *form* in which anxiety is manifested. This, too, was discussed by Freud in his early writings. To begin with (consistently with his view of anxiety as transformed libido) he regarded the most
[84] striking of its symptoms – the breathlessness and palpitations – as elements in the act of copulation, which, in the absence of the normal means of discharging the excitation, made their appearance in an isolated and exaggerated shape. This account can be found in Draft E of the Fliess papers, referred to above, and probably dating from June, 1894, and at the end of Section III of the first paper on anxiety neurosis (1895*b*), *RSE*, **3**; and it is repeated in the 'Dora' case history (1905*e* [1901]), where Freud wrote: 'I maintained years ago that the dyspnoea and palpitations that occur in hysteria and anxiety neurosis are only detached fragments of the act of copulation.' (Ibid., **7**, 71.) It is not clear how all this fitted in with Freud's views on the expression of the emotions in general. These seem certainly to have been ultimately derived from Darwin. In the *Studies on Hysteria* (1895*d*) he twice quoted Darwin's volume on the subject (Darwin, 1872), and on the second occasion recalled that Darwin has taught us that the expression of the emotions 'consists of actions which originally had a meaning and served a purpose' (*RSE*, **2**, 161). In a discussion before the Vienna Psychoanalytical Society in 1909, Freud is reported by Jones (1955, 494) as having said that 'every affect . . . is but the reminiscence of an experience'. Much later, in Lecture XXV of the *Introductory Lectures* (1916–17*a*), he took up this point again, and expressed his belief that the 'nucleus' of an affect is 'the repetition of some particular significant experience' (*RSE*, **16**, 349). He recalled, too, the explanation he had earlier given of hysterical attacks (1909*a*; ibid., **9**, 203) as revivals of events in infancy, and added his conclusion that 'a hysterical attack may thus be likened to a freshly constructed individual affect, and a normal affect to the expression of a general hysteria which has become a heritage' (ibid., **16**, 349). He repeats this theory in almost the same terms in the present work (pp. 83 and 118 below).

Whatever part this theory of the affects played in Freud's *earlier* explanation of the form taken by anxiety, it played an essential one in his *new* explanation, which emerged, apparently without warning, in a footnote added to the second edition of *The Interpretation of Dreams* (*RSE*, **5**, 358).[1] At the end of some discussion of phantasies about life in the womb, he went on (and printed the sentence in spaced type): 'Moreover, the act of birth is the first experience of anxiety, and thus the source
[85] and prototype of the affect of anxiety.' The edition was published in 1909, but the Preface is dated 'Summer, 1908'. A possible clue to the sudden emergence at that moment of this revolutionary notion is to be found in the fact that Freud had only recently contributed a Preface (dated 'March, 1908') to Stekel's book on anxiety states (Freud, 1908*f*; ibid., **9**, 221). The Preface, it is true, contains not the faintest

1 It appears that this hypothesis of Freud's was known to the Vienna Psychoanalytical Society some two years before its first publication. See an Editors' footnote to the *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 351 *n.* 1.

hint at the new theory, while Stekel's book itself seems explicitly to accept Freud's earlier one of the connection between anxiety and copulation. Nonetheless, Freud's interest must no doubt have been focused once again on the problem, and it may be that at that point an old memory may have been revived of an event which he described later, in the course of his discussion of anxiety in the *Introductory Lectures*. This memory was of what had been intended as a comic anecdote, told to him when he was a house physician by another young doctor, of how a midwife had declared that there is a connection between birth and being frightened. The memory must have gone back to about 1884, though Freud seems not to have mentioned it till this lecture in 1917. It seems possible that it had, in fact, been stirred up by his reading of Stekel's book and had provoked the appearance of the new theory in 1908. Thereafter that theory was never dropped. He gave it special prominence in the first of his papers on the psychology of love (1910*h*), *RSE*, **11**, 160. Though this was not published till 1910, the gist of it was given before the Vienna Psychoanalytical Society in May, 1909; while in November of the same year the *Minutes* of the Society report him as having remarked that children begin their experience of anxiety in the act of birth itself.

After the lecture in 1917 the subject lay fallow for some years, till it suddenly reappeared in *The Ego and the Id* (1923*b*), *RSE*, **19**, 52, where Freud spoke of birth as 'the first great anxiety state'. This carries us up to the time of the publication of Rank's book *The Trauma of Birth*. The chronological relation between this sentence of Freud's and Rank's book is not entirely clear. *The Ego and the Id* was published in April, 1923. The title page of Rank's book bears the date '1924'; but on its last page appear the words 'written in April, 1923', and the dedication declares that the book was 'presented' to Freud on May 6, 1923 (Freud's birthday). Although Ernest Jones [86]
(1957, 60) says specifically that Freud had not read it before its publication in December, 1923, he had nevertheless been aware of the general line of Rank's ideas as early as in September, 1922 (ibid., 61), and this is no doubt enough to account for the reference to birth in *The Ego and the Id*.[1]

Rank's book was far more than an adoption of Freud's explanation of the *form* taken by anxiety. He argued that all later attacks of anxiety were attempts at 'abreacting' the trauma of birth. He accounted for all neuroses on similar lines, incidentally dethroning the Oedipus complex, and proposed a reformed therapeutic technique based on the overcoming of the birth trauma. Freud's published references to the book seemed at first to be favourable.[2] But the present work shows a complete and final reversal of that opinion. His rejection of Rank's views, however, stimulated him to a reconsideration of his own, and *Inhibitions, Symptoms and Anxiety* was the result.

1 It may be remarked, incidentally, that this same sentence in *The Ego and the Id* includes a hint at the importance attributed here (pp. 120–3 below) to anxiety due to separation from the mother. This had already been emphasized in Lecture XXV of the *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 359.

2 See, for instance, a footnote added to the 'Little Hans' analysis in 1923 (ibid., **10**, 89 *n.* 2) and another added to the *Three Essays* at about the same date (ibid., **7**, 199–200 *n.* 3). A full account of Freud's fluctuating attitude appears in Jones, 1957, 61 ff.

INHIBITIONS, SYMPTOMS AND ANXIETY

I

In the description of pathological phenomena, linguistic usage enables us to distinguish symptoms from inhibitions [*Hemmungen*][T], without, however, attaching much importance to the distinction. Indeed, we might hardly think it worthwhile to differentiate exactly between the two, were it not for the fact that we meet with illnesses in which we observe the presence of inhibitions but not of symptoms and are curious to know the reason for this. [87]

The two concepts are not upon the same plane. Inhibition has a special relation to function. It does not necessarily have a pathological implication. One can quite well call a normal restriction of a function an inhibition of it. A symptom, on the other hand, actually denotes the presence of some pathological process. Thus, an inhibition may be a symptom as well. Linguistic usage, then, employs the word *inhibition* when there is a simple lowering of function, and *symptom* when a function has undergone some unusual change or when a new phenomenon [*Leistung*] has arisen out of it. Very often it seems to be quite an arbitrary matter whether we emphasize the positive side of a pathological process and call its outcome a symptom, or its negative side and call its outcome an inhibition.[t] But all this is really of little interest; and the problem as we have stated it does not carry us very far.

Since the concept of inhibition is so intimately associated with that of function, it might be helpful to examine the various functions of the ego [*Ichfunktionen*][T] with a view to discovering the forms which any disturbance of those functions assumes in each of the different neurotic affections. Let us pick out for a comparative study of this kind the sexual function [*Sexualfunktion*][T] and those of eating, of locomotion and of professional work. *Ich* *Sex*

(*a*) The sexual function is liable to a great number of disturbances, most of which exhibit the characteristics of simple inhibitions. These are classed together as psychical impotence. The normal performance of the
[88] sexual function can come about only as the result of a very complicated process, and disturbances may appear at any point in it. In men the chief stages at which inhibition occurs are shown by: a turning away of the libido at the very beginning of the process (psychical unpleasure [*Unlust*][T]); an absence of the physical preparation for it (lack of erection); an abridgement of the sexual act (*ejaculatio praecox*), an occurrence which might equally well be regarded as a symptom; an arrest of the act before it has reached its natural conclusion (absence of ejaculation); or a non-appearance of the psychical outcome (lack of the feeling of pleasure in orgasm). Other disturbances arise from the sexual function becoming dependent on special conditions of a perverse or fetishist nature.

That there is a relationship between inhibition and anxiety [*Angst*][T] is pretty evident. Some inhibitions obviously represent a relinquishment of a function because its exercise would produce anxiety. Many women are openly afraid of the sexual function. We class this anxiety under
Abwehr hysteria, just as we do the defensive symptom [*Abwehrsymptom*][T] of
Nachträglichkeit disgust which, arising originally as a deferred [*nachträgliche*][T] reaction to the experiencing of a passive sexual act, appears later whenever the *idea* [*Vorstellung*][T] of such an act is presented. Furthermore, many
Zwang obsessional acts [*Zwangshandlungen*][T] turn out to be measures of precaution and security against sexual experiences and are thus of a phobic character.

This is not very illuminating. We can note only that disturbances of the sexual function are brought about by a great variety of means. (1) The libido may simply be turned away (this seems most readily to produce what we regard as an inhibition pure and simple); (2) the function may be less well carried out; (3) it may be hampered by having conditions attached to it, or modified by being diverted to other aims; (4) it may be prevented by security measures; (5) if it cannot be prevented from starting, it may be immediately interrupted by the appearance of anxiety; and (6), if it is nevertheless carried out, there may be a subsequent [*nachträgliche*] reaction of protest against it and an attempt to undo what has been done.

(*b*) The function of nutrition is most frequently disturbed by a disinclination to eat, brought about by a withdrawal of libido. An increase in the desire to eat is also a not uncommon thing. The compulsion to

eat [*Esszwang*] is attributed to a fear of starving; but this is a subject which has been but little studied. The symptom of vomiting is known to us as a hysterical defence against eating. Refusal to eat owing to anxiety is a concomitant of psychotic states (delusions of being poisoned). [89]

(*c*) In some neurotic conditions locomotion is inhibited by a disinclination to walk or a weakness in walking. In hysteria there will be a paralysis of the motor apparatus, or this one special function of the apparatus will be abolished (abasia). Especially characteristic are the increased difficulties that appear in locomotion owing to the introduction of certain stipulations whose non-observance results in anxiety (phobia).

(*d*) In inhibition in work – a thing which we so often have to deal with as an isolated symptom in our therapeutic work – the subject feels a decrease in his pleasure [*Lust*] in it or becomes less able to do it well; or he has certain reactions to it, like fatigue, giddiness or sickness, if he is obliged to go on with it. If he is a hysteric he will have to give up his work owing to the appearance of organic and functional paralyses which make it impossible for him to carry it on. If he is an obsessional neurotic he will be perpetually being distracted from his work or losing time over it through the introduction of delays and repetitions.

Our survey might be extended to other functions as well; but there would be nothing more to be learnt by doing so. For we should not penetrate below the surface of the phenomena presented to us. Let us then proceed to conceptualize [*Auffassung*][T] inhibition in such a way as to leave very little doubt about what is meant by it, and say that inhibition is the expression of a *restriction of an ego function*. A restriction of this kind can itself have very different causes. Some of the mechanisms involved in this renunciation of function are well known to us, as is a certain general purpose which governs it.

This purpose is more easily recognizable in the *specific* inhibitions. Analysis shows that when activities like playing the piano, writing or even walking are subjected to neurotic inhibitions it is because the physical organs brought into play – the fingers or the legs – have become too strongly erotized. It has been discovered as a general fact that the ego function of an organ is impaired if its erotogenicity – its sexual significance – is increased. It behaves, if I may be allowed a rather absurd analogy, like a maidservant who refuses to go on cooking because her master has started a love affair with her. As soon as writing, [90]

which entails making a liquid flow out of a tube on to a piece of white paper, assumes the significance of copulation, or as soon as walking becomes a symbolic substitute for treading upon the body of mother earth, both writing and walking are stopped because they represent the performance of a forbidden sexual act. The ego renounces these functions, which are within its sphere, in order not to have to undertake fresh measures of repression [*Verdrängung*][T] – *in order to avoid a conflict with the id* [*Es*][T].

There are clearly also inhibitions which serve the purpose of self-punishment. This is often the case in inhibitions of professional activities. The ego is not allowed to carry on those activities, because they would bring success and gain, and these are things which the severe superego [*Über-Ich*][T] has forbidden. So the ego gives them up too, *in order to avoid coming into conflict with the superego*.

The more *generalized* inhibitions of the ego obey a different mechanism of a simple kind. When the ego is involved in a particularly difficult psychical task, as occurs in mourning, or when there is some tremendous suppression of affect or when a continual flood of sexual phantasies [*Phantasien*][T] has to be kept down, it loses so much of the energy at its disposal that it has to cut down the expenditure of it at many points at once. It is in the position of a speculator whose money has become tied up in his various enterprises. I came across an instructive example of this kind of intense, though shortlived, general inhibition. The patient, an obsessional neurotic, used to be overcome by a paralysing fatigue which lasted for one or more days whenever something occurred which should obviously have thrown him into a rage. We have here a point from which it should be possible to reach an understanding of the condition of general inhibition which characterizes states of depression, including the gravest form of them, melancholia.

As regards inhibitions, then, we may say in conclusion that they are restrictions of the functions of the ego which have been either imposed as a measure of precaution or brought about as a result of an impoverishment of energy; and we can see without difficulty in what respect an inhibition differs from a symptom: for a symptom cannot any longer be described as a process that takes place within, or acts upon, the ego.

II

The main characteristics of the formation of symptoms [*Symptombildung*][T] have long since been studied and, I hope, established beyond dispute.[1] A symptom is a sign of, and a substitute for, a drive satisfaction [*Triebbefriedigung*][T] which has remained in abeyance; it is a consequence of the process of repression. Repression proceeds from the ego when the latter – it may be at the behest of the superego – refuses to associate itself with a drive cathexis [*Triebbesetzung*][T] which has been aroused in the id. The ego is able by means of repression to keep the idea [*Vorstellung*] which is the vehicle of the reprehensible [*unliebsamen*][t] impulse [*Regung*][T] from becoming conscious. Analysis shows that the idea often persists as an unconscious formation. [91] *Bildung* *Trieb* *Besetzung*

So far everything seems clear; but we soon come upon difficulties which have not as yet been solved. Up till now our account of what occurs in repression has laid great stress on this point of exclusion from consciousness.[2] But it has left other points open to uncertainty. One question that arose was, what happened to the drive impulse which had been activated in the id and which sought satisfaction? The answer was an indirect one. It was that owing to the process of repression the pleasure that would have been expected from satisfaction had been transformed into unpleasure. But we were then faced with the problem of how the satisfaction of a drive could produce unpleasure. The whole matter can be clarified, I think, if we commit ourselves to the definite statement that as a result of repression the intended course of the excitatory process [*Erregungsablauf*][T] in the id does not occur at all; the ego succeeds in inhibiting or deflecting it. If this is so the problem of 'transformation of affect' under repression disappears.[3] At the same time this view implies a concession to the ego that it can exert a very extensive influence over processes in the id, and we shall have to find out in what way it is able to develop such surprising powers [*Machtentfaltung*][T]. *Erregung* [92] *Macht*

1 [See, for instance, the *Three Essays* (1905*d*), *RSE*, **7**, 146.]

2 [Cf. 'Repression' (1915*d*), ibid., **14**, 130.]

3 [The problem goes back a very long way. See, for instance, a letter to Fliess of December 6, 1896 (Freud, 1950*a*, Letter 52). The question was discussed by Freud in the 'Dora' case history (1905*e*), *RSE*, **7**, 26–7, where an Editors' footnote gives a number of other references to the subject. The present solution was indicated in a short footnote added by Freud in 1925 to *Beyond the Pleasure Principle* (1920*g*), ibid., **18**, 11 *n*.]

It seems to me that the ego obtains this influence by virtue of its intimate connections with the perceptual system – connections which, as we know, constitute its essence and provide the basis of its differentiation from the id. The function of this system, which we have called *Pcpt.-Cs.*, is bound up with the phenomenon of consciousness.[1] It receives excitations not only from outside but from within, and endeavours, by means of the sensations of pleasure and unpleasure which reach it from these quarters, to direct the course of mental
Seele [*seelischen*][T] events in accordance with the pleasure principle. We are very apt to think of the ego as powerless against the id; but when it is opposed to a drive process in the id it has only to give a '*signal of unpleasure*'[2] in order to attain its object with the aid of that almost omnipotent institution, the pleasure principle. To take this situation by itself for a moment, we can illustrate it by an example from another field. Let us imagine a country in which a certain small faction objects to a proposed measure the passage of which would have the support of the masses. This minority obtains command of the press and by its help manipulates the supreme arbiter, 'public opinion', and so succeeds in preventing the measure from being passed.

But this explanation opens up fresh problems. Where does the energy come from which is employed for giving the signal of unpleasure? Here we may be assisted by the idea that a defence against an unwelcome *internal* process will be modelled upon the defence adopted against an *external* stimulus, that the ego wards off internal and external dangers alike along identical lines. In the case of external danger the organism has recourse to attempts at flight. The first thing it does is to withdraw cathexis from the perception of the dangerous object; later on it discovers that it is a better plan to perform muscular movements of such a sort as will render perception of the dangerous object impossible even in the absence of any refusal to perceive it – that it is a better plan, that is, to remove itself from the sphere of danger. Repression is an equivalent of this attempt at flight. The ego withdraws its (preconscious)
[93] cathexis from the drive representative[3] [*Triebrepräsentanz*] that is to be repressed and uses that cathexis for the purpose of releasing unpleasure (anxiety). The problem of how anxiety arises in connection with repression may be no simple one; but we may legitimately hold firmly to the idea that the ego is the actual seat of anxiety and give up our earlier view

1 [Cf. *Beyond the Pleasure Principle* (1920*g*), *RSE*, **18**, 24.]

2 [See Editors' Introduction, p. 74 above.]

3 [I.e. what represents the drive in the mind. This term is fully discussed in the Editors' Note to 'Drives and their Vicissitudes' (1915*c*), *RSE*, **14**, 99 ff.]

[*Auffassung*] that the cathectic energy of the repressed impulse is automatically turned into anxiety. If I expressed myself earlier in the latter sense, I was giving a phenomenological description and not a metapsychological account of what was occurring.

This brings us to a further question: how is it possible, from an economic point of view, for a mere process of withdrawal and discharge [*Abfuhrvorgang*], like the withdrawing of a preconscious ego cathexis, to produce unpleasure or anxiety, seeing that, according to our assumptions, unpleasure and anxiety can only arise as a result of an *increase* in cathexis? The reply is that this causal sequence should not be explained from an economic point of view. Anxiety is not newly created in repression; it is reproduced as an affective state in accordance with an already existing mnemic image. If we go further and enquire into the origin of that anxiety – and of affects in general – we shall be leaving the realm of pure psychology and entering the borderland of physiology. Affective states have become incorporated in the mind as precipitates of primaeval traumatic experiences, and when a similar situation occurs they are revived like mnemic symbols.[1] I do not think I have been wrong in likening them to the more recent and individually acquired hysterical attack and in regarding them as its normal prototypes.[2] In man and the higher animals it would seem that the act of birth, as the individual's first experience of anxiety, has given the affect of anxiety certain characteristic forms of expression. But, while acknowledging this connection, we must not lay undue stress on it nor overlook the fact that biological necessity demands that a situation of [94]
danger should have an affective symbol, so that a symbol of this kind would have to be created in any case. Moreover, I do not think that we are justified in assuming that whenever there is an outbreak of anxiety something like a reproduction of the situation of birth goes on in the mind. It is not even certain whether hysterical attacks, though they were originally traumatic reproductions of this sort, retain that character permanently.

As I have shown elsewhere, most of the repressions with which we have to deal in our therapeutic work are cases of *after*-pressure.[3] They presuppose the operation of earlier, *primal repressions* which exert an attraction on the more recent situation. Far too little is known as yet

1 [This term was used by Freud throughout the *Studies on Hysteria* (1895*d*) in explaining hysterical symptoms. See, for instance, *RSE*, **2**, 265. A very clear account of the concept can be found in the first of the *Five Lectures* (1910*a*), ibid., **11**, 17 f.]

2 [See the Editors' Introduction, p. 74 above, and also below, pp. 118–19.]

3 [See 'Repression' (1915*d*), *RSE*, **14**, 131.]

about the background and preliminary stages of repression. There is a danger of overestimating the part played in repression by the superego. We cannot at present say whether it is perhaps the emergence of the superego which provides the line of demarcation between primal repression and after-pressure. At any rate, the earliest outbreaks of anxiety, which are of a very intense kind, occur before the superego has become differentiated. It is highly probable that the immediate precipitating causes of primal repressions are quantitative factors such as an excessive force of excitation and the breaking through of the protective shield against stimuli.[1]

This mention of the protective shield sounds a note which recalls to us the fact that repression occurs in two different situations – namely, when an undesirable [*unliebsame*][t] drive impulse is aroused by some external perception, and when it arises internally without any such provocation. We shall return to this difference later [p. 138 below]. But the protective shield exists only in regard to external stimuli, not in regard to internal drive demands.

So long as we direct our attention to the ego's attempt at flight we shall get no nearer to the subject of symptom-formation. A symptom arises from a drive impulse which has been detrimentally affected by repression. If the ego, by making use of the signal of unpleasure, attains its object of completely suppressing the drive impulse, we learn nothing
[95] of how this has happened. We can only find out about it from those cases in which repression must be described as having to a greater or lesser extent failed. In this event the position, generally speaking, is that the drive impulse has found a substitute in spite of repression, but a substi-
Verschiebung tute which is very much reduced, displaced [*verschobenen*][T] and inhibited and which is no longer recognizable as a satisfaction. And when the substitutive impulse is carried out there is no sensation of pleasure; its carrying out has, instead, the quality of a compulsion [*Zwanges*].

In thus degrading a process of satisfaction to a symptom, repression displays its power in a further respect. The substitutive process is prevented, if possible, from finding discharge through motility; and even if this cannot be done, the process is forced to expend itself in making alterations in the subject's own body and is not permitted to impinge upon the external world. It must not be transformed into action. For, as we know, in repression the ego is operating under the influence of external reality and therefore it debars the substitutive process from having any effect upon that reality.

1 [Cf. *Beyond the Pleasure Principle* (1920g), *RSE*, **18**, 27 ff.]

Just as the ego controls the path to action in regard to the external world, so it controls access to consciousness. In repression it exercises its power in both directions, acting in the one manner upon the drive impulse itself and in the other upon the [psychical] representative of that impulse. At this point it is relevant to ask how I can reconcile this acknowledgement of the might of the ego with the description of its position which I gave in *The Ego and the Id*. In that book I drew a picture of its dependent relationship to the id and to the superego and revealed how powerless and apprehensive it was in regard to both and with what an effort it maintained its show of superiority over them.[1] This view has been widely echoed in psychoanalytic literature. Many writers have laid much stress on the weakness of the ego in relation to the id and of our rational elements in the face of the demonic forces within us; and they display a strong tendency to make what I have said into a cornerstone of a psychoanalytic *Weltanschauung*. Yet surely the psychoanalyst, with his knowledge of the way in which repression works, should, of all people, be restrained from adopting such an extreme and one-sided view.

I must confess that I am not at all partial to the fabrication of *Weltanschauungen*.[2] Such activities may be left to philosophers, who avowedly find it impossible to make their journey through life without a Baedeker of that kind to give them information on every subject. Let us humbly accept the contempt with which they look down on us from the vantage ground of their superior needs. But since *we* cannot forgo our narcissistic pride either, we will draw comfort from the reflection that such 'Handbooks to Life' soon grow out of date and that it is precisely our short-sighted, narrow and finicky work which obliges them to appear in new editions, and that even the most up-to-date of them are nothing but attempts to find a substitute for the ancient, useful and all-sufficient church catechism. We know well enough how little light science has so far been able to throw on the problems that surround us. But however much ado the philosophers may make, they cannot alter the situation. Only patient, persevering research, in which everything is subordinated to the one requirement of certainty, can gradually bring about a change. The benighted traveller may sing aloud in the dark to deny his own fears [*Ängstlichkeit*]; but, for all that, he will not see an inch further beyond his nose. [96]

1 [*The Ego and the Id* (1923*b*), Chapter V; *RSE*, **19**, 43 ff.]

2 [Cf. a prolonged discussion of this in the last of Freud's *New Introductory Lectures* (1933*a*), ibid., **22**, 139 ff.]

III

[97] To return to the problem of the ego:[1] The apparent contradiction is due to our having taken abstractions too rigidly and attended exclusively now to the one side and now to the other of what is, in fact, a complicated state of affairs. We were justified, I think, in dividing the ego from the id, for there are certain considerations which necessitate that step. On the other hand, the ego is identical to the id, and is merely a specially differentiated part of it. If we think of this part by itself in contradistinction to the whole, or if a real split has occurred between the two, the weakness of the ego becomes apparent. But if the ego remains bound up with the id and indistinguishable from it, then it displays its strength. The same is true of the relation between the ego and the superego. In many situations the two are merged; and as a rule we can distinguish one from the other only when there is a tension or conflict between them. In repression the decisive fact is that the ego is an organization and the id is not. The ego is, indeed, the organized portion of the id. We should be quite wrong if we pictured the ego and the id as two opposing camps and if we supposed that, when the ego tries to suppress a part of the id by means of repression, the remainder of the id comes to the rescue of the endangered part and measures its strength with the ego. This may often be what happens, but it is certainly not the initial situation in repression. As a rule the drive impulse which is to be repressed remains isolated. Although the act of repression demonstrates the strength of the ego, in one particular it reveals the ego's powerlessness and how impervious to influence are the separate drive impulses of the id. For the mental process which has been turned into a symptom owing to repression now maintains its existence outside the organization of the ego and independently of it. Indeed, it is not that process alone but all its derivatives which enjoy, as it were, this same privilege of extraterritoriality; and whenever they come into associative contact with a part of the ego organization, it is not at all
[98] certain that they will not draw that part over to themselves and thus enlarge themselves at the expense of the ego. An analogy with which we have long been familiar compared a symptom to a foreign body which was keeping up a constant succession of stimuli and reactions in the

1 [I.e. the contrast between its strength and weakness in relation to the id.]

tissue in which it was embedded.[1] It does sometimes happen that the defensive struggle against an unwelcome drive impulse is brought to an end with the formation of a symptom. As far as can be seen, this is most often possible in hysterical conversion. But usually the outcome is different. The initial act of repression is followed by a tedious or interminable sequel in which the struggle against the drive impulse is prolonged into a struggle against the symptom.

In this secondary defensive struggle the ego presents two faces with contradictory expressions. The one line of behaviour it adopts springs from the fact that its very nature obliges it to make what must be regarded as an attempt at restoration or reconciliation. The ego is an organization. It is based on the maintenance of free intercourse and of the possibility of reciprocal influence between all its parts. Its desexualized energy still shows traces of its origin in its impulsion to bind together and unify, and this necessity to synthesize grows stronger in proportion as the strength of the ego increases. It is therefore only natural that the ego should try to prevent symptoms from remaining isolated and alien by using every possible method to bind them to itself in one way or another, and to incorporate them into its organization by means of those bonds. As we know, a tendency of this kind is already operative in the very act of forming a symptom. A classical instance of this are those hysterical symptoms which have been shown to be a compromise between the need for satisfaction and the need for punishment.[2] Such symptoms participate in the ego from the very beginning, since they fulfil a requirement of the superego, while, on the other hand, they represent positions occupied by the repressed and points at which an irruption has been made by it into the ego organization. They are a kind [99]
of frontier station with a mixed garrison.[3] (Whether all primary hysterical symptoms are constructed on these lines would be worth enquiring into very carefully.) The ego now proceeds to behave as though it recognized that the symptom had come to stay and that the only thing to do was to accept the situation in good part and draw as much advantage from it as possible. It makes an adaptation to the symptom – to this piece of the internal world which is alien to it – just as it normally does to the real external world. It can always find plenty of

1 [This analogy is discussed and criticized in Freud's contribution to *Studies on Hysteria* (1895*d*), *RSE*, **2**, 258–9. It appeared originally in the 'Preliminary Communication' (1893*a*), ibid., 6.]

2 [This idea was foreshadowed in Section II of Freud's second paper on 'The Neuropsychoses of Defence' (1896*b*), ibid., **3**, 179–81.]

3 [*gemischter Besetzung*. This metaphor relies on the fact that '*Besetzung*', the German word for 'cathexis', can also have the sense of 'garrison'.]

opportunities for doing so. The presence of a symptom may entail a certain impairment of capacity, and this can be exploited to appease some demand on the part of the superego or to refuse some claim from the external world. In this way the symptom gradually comes to be the representative of important interests; it is found to be useful in asserting the position of the self and becomes more and more closely merged with the ego and more and more indispensable to it. It is only very rarely that the physical process of 'healing' round a foreign body follows such a course as this. There is a danger, too, of exaggerating the importance of a secondary adaptation of this kind to a symptom, and of saying that the ego has created the symptom merely in order to enjoy its advantages. It would be equally true to say that a man who had lost his leg in the war had got it shot away so that he might thenceforward live on his pension without having to do any more work.

In obsessional neurosis and paranoia the forms which the symptoms assume become very valuable to the ego because they obtain for it, not certain advantages, but a narcissistic satisfaction which it would otherwise be without. The systems which the obsessional neurotic constructs flatter his self-love by making him feel that he is better than other people because he is specially cleanly or specially conscientious. The delusional constructions [*Wahnbildungen*] of the paranoic offer to his acute perceptive and imaginative powers a field of activity which he could not easily find elsewhere.

[100] All of this results in what is familiar to us as the '(secondary) gain from illness' which follows a neurosis.[1] This gain comes to the assistance of the ego in its endeavour to incorporate the symptom and increases the symptom's fixation. When the analyst tries subsequently to help the ego in its struggle against the symptom, he finds that these conciliatory bonds between ego and symptom operate on the side of the resistances and that they are not easy to loosen.

The two lines of behaviour which the ego adopts towards the symptom are, in fact, directly opposed to each other. For the other line is less friendly in character, since it continues in the direction of repression. Nevertheless, the ego, it appears, cannot be accused of inconsistency. Being of a peaceable disposition it would like to incorporate the symptom and make it part of itself. It is from the symptom itself that the trouble comes. For the symptom, being the true substitute for and derivative of the repressed impulse, carries on the role of the latter; it

1 [A full discussion of this was given in Lecture XXIV of the *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 337–9.]

continually renews its demands for satisfaction and thus obliges the ego in its turn to give the signal of unpleasure and put itself in a posture of defence.

The secondary defensive struggle against the symptom takes many shapes. It is fought out on different fields and makes use of a variety of methods. We shall not be able to say much about it until we have made an enquiry into the various different instances of symptom-formation. In doing this we shall have an opportunity of going into the problem of anxiety – a problem which has long been looming in the background. The wisest plan will be to start from the symptoms produced by the hysterical neurosis; for we are not as yet in a position to consider the conditions in which the symptoms of obsessional neurosis, paranoia and other neuroses are formed.

IV

[101] Let us start with an infantile hysterical phobia of animals – for instance, the case of 'Little Hans' [1909*b*], whose phobia of horses was undoubtedly typical in all its main features. The first thing that becomes apparent is that in a concrete case of neurotic illness the state of affairs is much more complex than one would suppose so long as one was dealing with abstractions. It takes a little time to find one's bearings and to decide which the repressed impulse is, what substitutive symptom it has found and where the motive [*Motiv*] for repression lies.

'Little Hans' refused to go out into the street because he was afraid of [*Angst vor*] horses. This was the raw material of the case. Which part of it constituted the symptom? Was it his having the fear [*Angstentwicklung*]? Was it his choice of an object for his fear [*Angstobjekts*]? Was it his giving up of his freedom of movement? Or was it more than one of these combined? What was the satisfaction which he renounced *Versagung* [*versagt*][T]? And why did he have to renounce [*versagen*] it?

At first glance one is tempted to reply that the case is not so very obscure. 'Little Hans's' unaccountable fear of [*Angst vor*] horses was the symptom and his inability to go out into the streets was an inhibition, a restriction which his ego had imposed on itself so as not to arouse the anxiety symptom. The second point is clearly correct; and in the discussion which follows I shall not concern myself any further with this inhibition. But as regards the alleged symptom, a superficial acquaintance with the case does not even disclose its true formulation. For further investigation shows that what he was suffering from was not a vague fear of horses but a quite definite apprehension [*ängstliche Erwartung*] that a horse was going to bite him.[1] This idea, indeed, was endeavouring to withdraw from consciousness and get itself replaced by an undefined phobia in which only the anxiety and its object still appeared. Was it perhaps this idea that was the nucleus of his symptom?

We shall not make any headway until we have reviewed the little boy's psychical situation as a whole as it came to light in the course of the analytic treatment. He was at the time in the jealous and hostile [102] Oedipus attitude towards his father, whom nevertheless – except insofar as his mother was the cause of estrangement – he dearly loved. Here,

1 [*RSE*, **10**, 19.]

then, we have a conflict due to ambivalence: a well-grounded love and a no less justifiable hatred directed towards one and the same person. 'Little Hans's' phobia must have been an attempt to solve this conflict. Conflicts of this kind due to ambivalence are very frequent and they can have another typical outcome, in which one of the two conflicting feelings (usually that of affection) becomes enormously intensified and the other vanishes. The exaggerated degree and compulsive [*Zwangsmässige*] character of the affection alone betray the fact that it is not the only one present but is continually on the alert to keep the opposite feeling under suppression, and enable us to postulate the operation of a process which we call repression by means of *reaction-formation* (in the ego). Cases like 'Little Hans's' show no traces of a reaction-formation of this kind. There are clearly different ways of egress from a conflict due to ambivalence.

Meanwhile we have been able to establish another point with certainty. The drive impulse which underwent repression in 'Little Hans' was a hostile one against his father. Proof of this was obtained in his analysis while the idea of the biting horse was being followed up. He had seen a horse fall down and he had also seen a playmate, with whom he was playing at horses, fall down and hurt himself.[1] Analysis justified the inference that he had a wishful impulse that his father should fall down and hurt himself as his playmate and the horse had done. Moreover, his attitude towards someone's departure on a certain occasion[2] makes it probable that his wish that his father should be out of the way also found less hesitating expression. But a wish of this sort is tantamount to an intention of putting one's father out of the way oneself – is tantamount, that is, to the murderous impulse of the Oedipus complex.

So far there seem to be no connecting links between 'Little Hans's' repressed drive impulse and the substitute for it which we suspect is to be seen in his phobia of horses. Let us simplify his psychical situation by setting on one side the infantile factor and the ambivalence. Let us imagine that he is a young servant who is in love with the mistress of the house and has received some tokens of her favour. He hates his [103]
master, who is more powerful than he is, and he would like to have him out of the way. It would then be eminently natural for him to dread [*fürchtet*] his master's vengeance and to develop a fear [*Angst*] of him – just as 'Little Hans' developed a phobia of horses. We cannot,

1 [*RSE*, **10**, 39 and 63.]

2 [Ibid., 23.]

therefore, describe the fear belonging to this phobia as a symptom. If 'Little Hans', being in love with his mother, had shown fear of his father, we should have no right to say that he had a neurosis or a phobia. His emotional reaction would have been entirely comprehensible. What made it a neurosis was one thing alone: the replacement of his father with a horse. It is this displacement, then, which has a claim to be called a symptom, and which, incidentally, constitutes the alternative mechanism which enables a conflict due to ambivalence to be resolved without the aid of a reaction-formation. [Cf. above, p. 91.] Such a displacement is made possible or facilitated at 'Little Hans's' early age because the inborn traces of totemic thought can still be easily revived. Children do not as yet recognize or, at any rate, lay such exaggerated stress upon the gulf that separates human beings from the animal world.[1] In their eyes the grown man, the object of their fear and admiration, still belongs to the same category as the big animal who has so many enviable attributes but against whom they have been warned because he may become dangerous. As we see, the conflict due to ambivalence is not dealt with in relation to one and the same person: it is circumvented, as it were, by one of the pair of conflicting impulses being directed to another person as a substitutive object.

So far everything is clear. But the analysis of 'Hans's' phobia has been a complete disappointment in one respect. The distortion which constituted the symptom-formation was not applied to the [psychical] representative (the ideational content) [*Vorstellungsinhalt*] of the drive impulse that was to be repressed; it was applied to a quite different representative and one which corresponded only to a *reaction* to the disagreeable drive. It would be more in accordance with our expectations if 'Little Hans' had developed, instead of a fear of horses, an inclination to ill-treat them and to beat them or if he had expressed in
[104] plain terms a wish to see them fall down or be hurt or even die in convulsions ('make a row with their feet').[2] Something of the sort did in fact emerge in his analysis, but it was not by any means at the forefront of his neurosis. And, curiously enough, if he really had produced a hostility of this sort not against his father but against horses as his main symptom, we should not have said that he was suffering from a neurosis. There must be something wrong either with our view of repression or with our definition of a symptom. One thing, of course, strikes us at once: if 'Little Hans' had really behaved like that to horses, it would

1 [Cf. 'A Difficulty in the Path of Psychoanalysis' (1917*a*), *RSE*, **17**, 130.]

2 [Ibid., **10**, 39.]

mean that repression had in no way altered the character of his objectionable and aggressive drive impulse itself but only the object towards which it was directed.

Undoubtedly there are cases in which this is all that repression does. But more than this happened in the development of 'Little Hans's' phobia – how much more can be guessed from a part of another analysis.

As we know, 'Little Hans' alleged that what he was afraid of was that a horse would bite him. Now some time later I was able to learn something about the origin of another animal phobia. In this instance the dreaded animal was a wolf; it, too, had the significance of a father substitute. As a boy the patient in question – a Russian whom I did not analyse till he was in his twenties – had had a dream (whose meaning was revealed in analysis) and, immediately after it, had developed a fear of being devoured by a wolf, like the seven little goats in the fairy tale.[1] In the case of 'Little Hans' the ascertained fact that his father used to play at horses with him[2] doubtless determined his choice of a horse as his anxiety-animal. In the same way it appeared at least highly probable that the father of my Russian patient used, when playing with him, to pretend to be a wolf and jokingly threaten to gobble him up.[3] Since then I have come across a third instance. The patient was a young American who came to me for analysis. He did not, it is true, develop an animal phobia, but it is precisely because of this omission that his case [105]
helps to throw light upon the other two. As a child he had been sexually excited by a fantastic children's story which had been read aloud to him about an Arab chief who pursued a 'gingerbread man'[4] so as to eat him up. He identified himself with this edible person, and the Arab chief was easily recognizable as a father substitute. This phantasy formed the earliest substratum of his auto-erotic phantasies.

The idea of being devoured by the father is typical age-old childhood material. It has familiar parallels in mythology (e.g. the myth of Kronos) and in the animal kingdom. Yet in spite of this confirmation the idea is so strange to us that we can hardly credit its existence in a child. Nor do we know whether it really means what it seems to say, and we cannot understand how it can have become the subject of a phobia. Analytic observation supplies the requisite information. It shows that the idea of

1 'From the History of an Infantile Neurosis' (1918*b*) [*RSE*, **17**, 26 ff.].

2 [Ibid., **10**, 97.]

3 [Ibid., **17**, 29.]

4 [In English in the original.]

being devoured by the father gives expression, in a form that has undergone regressive degradation, to a passive, tender impulse to be loved by him in a genital-erotic sense. Further investigation of the case history[1] leaves no doubt of the correctness of this explanation. The genital impulse, it is true, betrays no sign of its tender purpose when it is expressed in the language belonging to the superseded transitional phase between the oral and sadistic organizations of the libido. Is it, moreover, a question merely of the replacement of the [psychical] representative with a regressive form of expression or is it a question of a genuine regressive degradation of the genitally directed impulse in the id? It is not at all easy to make certain. The case history of the Russian 'Wolf Man' gives very definite support to the second, more serious, view; for, from the time of the decisive dream onwards, the boy became naughty, tormenting and sadistic, and soon afterwards developed a regular obsessional neurosis. At any rate, we can see that repression is not the only means which the ego can employ for the purpose of defence against an unwelcome drive impulse. If it succeeds in making a drive regress, it will actually have done it more injury than it could have by repressing it. Sometimes, indeed, after forcing a drive to regress in this way, it goes on to repress it.

[106] The case of the 'Wolf Man' and the somewhat less complicated one of 'Little Hans' raise a number of further considerations. But we have already made two unexpected discoveries. There can be no doubt that the drive impulse which was repressed in both phobias was a hostile one against the father. One might say that that impulse had been repressed by the process of being transformed into its opposite.[2] Instead of aggressiveness on the part of the subject towards his father, there appeared aggressiveness (in the shape of revenge) on the part of his father towards the subject. Since this aggressiveness is in any case rooted in the sadistic phase of the libido, only a certain amount of degradation is needed to reduce it to the oral stage. This stage, while only hinted at in 'Little Hans's' fear of being bitten, was blatantly exhibited in the 'Wolf Man's' terror of being devoured. But, besides this, the analysis has demonstrated, beyond a shadow of doubt, the presence of another drive impulse of an opposite nature which had succumbed to repression. This was a tender, passive impulse directed towards the father, which had already reached the genital (phallic) level of libidinal organization. As regards the final outcome of the process of repression, this impulse

1 [Of the Russian patient.]

2 [Cf. 'Drives and their Vicissitudes' (1915*c*), *RSE*, **14**, 111 ff.]

seems, indeed, to have been the more important of the two; it underwent a more far-reaching regression and had a decisive influence upon the content of the phobia. In following up a *single* drive repression we have thus had to recognize a convergence of *two* such processes. The two drive impulses that have been overtaken by repression – sadistic aggressiveness towards the father and a tender passive attitude to him – form a pair of opposites. Furthermore, a full appreciation of 'Little Hans's' case shows that the formation of his phobia had had the effect of abolishing his affectionate object cathexis of his mother as well, though the actual content of his phobia betrayed no sign of this. The process of repression had attacked almost all the components of his Oedipus complex – both his hostile and his tender impulses towards his father and his tender impulses towards his mother. In my Russian patient this state of affairs was much less obvious.

These are unwelcome complications, considering that we set out to study only simple cases of symptom-formation due to repression, and with that intention selected the earliest and, to all appearances, most transparent neuroses of childhood. Instead of a single repression we have found a collection of them and have become involved with regression into the bargain. Perhaps we have added to the confusion by treating the two cases of animal phobia at our disposal – 'Little Hans' and the 'Wolf Man' – as though they were cast in the same mould. As a matter of fact, certain differences between them stand out. It is only with regard to 'Little Hans' that we can say with certainty that what his phobia disposed of were the two main impulses of the Oedipus complex – his aggressiveness towards his father and his over-fondness for his mother. A tender feeling for his father was undoubtedly there too and played a part in repressing the opposite feeling; but we can prove neither that it was strong enough to draw repression upon itself nor that it disappeared afterwards. 'Hans' seems, in fact, to have been a normal boy with what is called a 'positive' Oedipus complex. It is possible that the factors which we do not find were actually at work in him, but we cannot demonstrate their existence. Even the most exhaustive analysis has gaps in its data and is insufficiently documented. In the case of the Russian the deficiency lies elsewhere. His attitude to female objects had been disturbed by an early seduction[1] and his passive, feminine side was strongly developed. The analysis of his wolf dream revealed very little intentional aggressiveness towards his father, but it brought forward unmistakable proof that what repression overtook was his passive [107]

1 [*RSE*, **17**, 17 ff.]

tender attitude to his father. In his case, too, the other factors may have been operative as well; but they were not in evidence. How is it that, in spite of these differences in the two cases, almost amounting to an antithesis, the final outcome – a phobia – was approximately the same? The answer must be sought in another quarter. I think it will be found in the second fact which emerges from our brief comparative examination. It seems to me that in both cases we can detect what the motive force [*Motor*] of the repression was and can substantiate our view of its nature from the line of development which the two children subsequently pursued. This motive force was the same in both of them. It [108] was the fear [*Angst*] of impending castration. 'Little Hans' gave up his aggressiveness towards his father from fear of being castrated. His fear that a horse would bite him can, without any forcing, be given the full sense of a fear that a horse would bite off his genitals, would castrate him. But it was from fear of being castrated, too, that the little Russian relinquished his wish to be loved by his father, for he thought that a relation of that sort presupposed a sacrifice of his genitals – of the organ which distinguished him from a female. As we see, both forms of the Oedipus complex, the normal, active form and the inverted one, came to grief through the castration complex. The Russian boy's anxiety idea of being devoured by a wolf contained, it is true, no suggestion of castration, for the oral regression it had undergone had removed it too far from the phallic stage. But the analysis of his dream rendered further proof superfluous. It was a triumph of repression that the form in which his phobia was expressed should no longer have contained any allusion to castration.

Here, then, is our unexpected finding: in both patients the motive force of the repression was fear of castration. The ideas contained in their anxiety – being bitten by a horse and being devoured by a wolf – were substitutes by distortion for the idea of being castrated by their father. This was the idea which had undergone repression. In the Russian boy the idea was an expression of a wish which was not able to subsist in the face of his masculine revolt; in 'Little Hans' it was the expression of a reaction in him which had turned his aggressiveness into its opposite. But the *affect* of anxiety, which was the essence of the phobia, came, not from the process of repression, not from the libidinal cathexes of the repressed impulses, but from the repressing agency itself. The anxiety belonging to the animal phobias was an untransformed fear of castration. It was therefore a realistic fear,[1] a fear of a danger which

1 ['*Realangst*' in the German. The adjective 'realistic' has, throughout the *RSE*, been preferred to the impossible 'real' and to 'objective' which has been used elsewhere, but which gives rise to evident ambiguities. On the other hand, for '*Realgefahr*' we have 'real danger'.]

was actually impending or was judged to be a real one. It was anxiety which produced repression and not, as I formerly believed, repression which produced anxiety. [109]

It is no use denying the fact, though it is not pleasant to recall it, that I have on many occasions asserted that in repression the drive representative is distorted, displaced, and so on, while the libido belonging to the drive impulse is transformed into anxiety.[1] But now an examination of phobias, which should be best able to provide confirmatory evidence, fails to bear out my assertion; it seems, rather, to contradict it directly. The anxiety felt in animal phobias is the ego's fear of castration; while the anxiety felt in agoraphobia (a subject that has been less thoroughly studied) seems to be its fear of sexual temptation – a fear which, after all, must be connected in its origins with the fear of castration. As far as can be seen at present, the majority of phobias go back to an anxiety of this kind felt by the ego in regard to the demands of the libido. It is always the ego's attitude of anxiety which is the primary thing and which sets repression going. Anxiety never arises from repressed libido. If I had contented myself earlier with saying that after the occurrence of repression a certain amount of anxiety appeared in place of the manifestation of libido that was to be expected, I should have nothing to retract today. The description would be correct; and there does undoubtedly exist a correspondence of the kind asserted between the strength of the impulse that has to be repressed and the intensity of the resultant anxiety. But I must admit that I thought I was giving more than a mere description. I believed I had put my finger on a metapsychological process of direct transformation of libido into anxiety. I can now no longer maintain this view. And, indeed, I found it impossible at the time to explain how a transformation of that kind was carried out.

It may be asked how I arrived at this idea of transformation in the first instance. It was while I was studying the 'actual neuroses' [*Aktualneurosen*][T], at a time when analysis was still a very long way from distinguishing between processes in the ego and processes in the id.[2] I found that outbreaks of anxiety and a general state of preparedness of anxiety were produced by certain sexual practices such as *coitus interruptus*, undischarged sexual excitation or enforced abstinence – that is, whenever sexual excitation was inhibited, arrested or deflected in its [110]

1 [See, for instance, Freud's paper on repression (1915*d*), *RSE*, **14**, 137, where the case of the 'Wolf Man' is also considered. A further discussion can be found in Addendum A (*b*), p. 142 ff. below, as well as in the Editors' Introduction, p. 70 ff. above.]

2 [See Freud's first paper on anxiety neurosis (1895*b*), *RSE*, **3**, 81 ff.]

progress towards satisfaction. Since sexual excitation was an expression of libidinal drive impulses it did not seem too rash to assume that the libido was turned into anxiety through the agency of these disturbances. The observations which I made at the time still hold good. Moreover, it cannot be denied that the libido belonging to the id processes is subjected to disturbance at the instigation of repression. It might still be true, therefore, that in repression anxiety is produced from the libidinal cathexis of the drive impulses. But how can we reconcile this conclusion with our other conclusion that the anxiety felt in phobias is an ego anxiety and arises in the ego, and that it does not proceed out of repression but, on the contrary, sets repression in motion? There seems to be a contradiction here which it is not at all a simple matter to solve. It will not be easy to reduce the two sources of anxiety to a single one. We might attempt to do so by supposing that, when coitus is disturbed or sexual excitation interrupted or abstinence enforced, the ego scents certain dangers to which it reacts with anxiety. But this takes us nowhere. On the other hand, our analysis of the phobias seems to admit of no correction. *Non liquet*.[1]

1 ['It is not clear.' An old legal verdict used when the evidence was inconclusive; compare the Scottish 'not proven'.]

V

We set out to study the formation of symptoms and the secondary [111]
struggle waged by the ego against symptoms. But in picking on the phobias for this purpose we have clearly made an unlucky choice. The anxiety which predominates in the picture of these disorders is now seen as a complication which obscures the situation. There are plenty of neuroses which exhibit no anxiety whatever. True conversion hysteria is one of these. Even in its most severe symptoms no admixture of anxiety is found. This fact alone ought to warn us against making too close a connection between anxiety and symptom-formation. The phobias are so closely akin to conversion hysteria in every other respect that I have felt justified in classing them alongside of it under the name of 'anxiety hysteria'. But no-one has as yet been able to say what it is that determines whether any given case shall take the form of a conversion hysteria or a phobia – has been able, that is to say, to establish what determines the generating of anxiety in hysteria.

The commonest symptoms of conversion hysteria – motor paralyses, contractures, involuntary actions or discharges [*Entladung*], pains and hallucinations – are cathectic processes which are either permanently maintained or intermittent. But this puts fresh difficulties in the way. Not much is actually known about these symptoms. Analysis can show what the disturbed excitatory process [*Erregungsablauf*] is which the symptoms replace. It usually turns out that they themselves have a share in that process. It is as though the whole energy of the process had been concentrated in this one part of it. For instance, it will be found that the pains from which a patient suffers were present in the situation in which the repression occurred; or that his hallucination was, at that time, a perception; or that his motor paralysis is a defence against an action which should have been performed in that situation but was inhibited; or that his contracture is usually a displacement of an intended innervation of the muscles in some other part of his body; or that his convulsions are the expression of an outburst of affect which has been withdrawn from the normal control of the ego. The sensation of unpleasure which accompanies the appearance of the symptoms varies [112]
in a striking degree. In chronic symptoms which have been displaced on to motility, like paralyses and contractures, it is almost always entirely absent; the ego behaves towards the symptoms as though it had nothing

to do with them. In intermittent symptoms and in those concerned with the sensory sphere, sensations of unpleasure are as a rule distinctly felt; and in symptoms of pain these may reach an extreme degree. The picture presented is so manifold that it is difficult to discover the factor which permits of all these variations and yet allows a uniform explanation of them. There is, moreover, little to be seen in conversion hysteria of the ego's struggle against the symptom after it has been formed. It is only when sensitivity to pain in some part of the body constitutes the symptom that that symptom is in a position to play a dual role. The symptom of pain will appear no less regularly whenever the part of the body concerned is touched from outside than when the pathogenic situation which it represents is associatively activated from within; and the ego will take precautions to prevent the symptom from being aroused through external perceptions. Why the formation of symptoms in conversion hysteria should be such a peculiarly obscure thing I cannot tell; but the fact affords us a good reason [*Motiv*] for quitting such an unproductive field of enquiry without delay.

Let us turn to the obsessional neuroses in the hope of learning more about the formation of symptoms. The symptoms belonging to this neurosis fall, in general, into two groups, each having an opposite trend. They are either prohibitions, precautions and expiations – that is, negative in character – or they are, on the contrary, substitutive satisfactions which often appear in symbolic disguise. The negative, defensive group of symptoms is the older of the two; but as illness is prolonged, the satisfactions, which scoff at all defensive measures, gain the upper hand. The symptom-formation scores a triumph if it succeeds in combining the prohibition with satisfaction so that what was originally a defensive command or prohibition acquires the significance of a satisfaction as well; and in order to achieve this end it will often make use of the most ingenious associative paths. Such an achievement demonstrates the tendency of the ego to synthesize, which we have already observed
[113] [p. 87 above]. In extreme cases the patient manages to make most of his symptoms acquire, in addition to their original meaning, a directly contrary one. This is a tribute to the power of ambivalence, which, for some unknown reason, plays such a large part in obsessional neuroses. In the crudest instance the symptom is diphasic:[1] an action which carries out a certain injunction is immediately succeeded by another action which

1 [I.e. occurs in two instalments. Cf. a passage in Lecture XIX of the *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 266. See also below, p. 106.]

stops or undoes the first one even if it does not go quite so far as to carry out its opposite.

Two impressions at once emerge from this brief survey of obsessional symptoms. The first is that a ceaseless struggle is being waged against the repressed, in which the repressing forces steadily lose ground; the second is that the ego and the superego have a specially large share in the formation of the symptoms.

Obsessional neurosis is unquestionably the most interesting and repaying subject of analytic research. But as a problem it has not yet been mastered. It must be confessed that, if we endeavour to penetrate more deeply into its nature, we still have to rely upon doubtful assumptions and unconfirmed suppositions. Obsessional neurosis originates, no doubt, in the same situation as hysteria, namely, the necessity of fending off the libidinal demands of the Oedipus complex. Indeed, every obsessional neurosis seems to have a substratum of hysterical symptoms that have been formed at a very early stage.[1] But it is subsequently shaped along quite different lines owing to a constitutional factor. The genital organization of the libido turns out to be feeble and insufficiently resistant, so that when the ego begins its defensive efforts the first thing it succeeds in doing is to throw back the genital organization (of the phallic phase), in whole or in part, to the earlier sadistic-anal level. This fact of regression is decisive for all that follows.

Another possibility has to be considered. Perhaps regression is the result not of a constitutional factor but of a time factor. It may be that regression is rendered possible not because the genital organization of [114]
the libido is too feeble but because the opposition of the ego begins too early, while the sadistic phase is at its height. I am not prepared to express a definite opinion on this point, but I may say that analytic observation does not speak in favour of such an assumption. It shows rather that, by the time an obsessional neurosis is entered upon, the phallic stage has already been reached. Moreover, the onset of this neurosis belongs to a later time of life than that of hysteria – to the second period of childhood, after the latency period has set in. In a woman patient whose case I was able to study and who was overtaken by this disorder at a very late date, it became clear that the determining cause of her regression and of the emergence of her obsessional neurosis was

1 [See Section II of Freud's second paper on 'The Neuropsychoses of Defence' (1896*b*), *RSE*, **3**, 178. An example occurs in the 'Wolf Man' analysis (1918*b*), ibid., **17**, 68.]

a real occurrence through which her genital life, which had up till then been intact, lost all its value.[1]

As regards the metapsychological explanation of regression, I am inclined to find it in a 'defusion of drive', in a detachment of the erotic components which, with the onset of the genital stage, had joined the destructive cathexes belonging to the sadistic phase.[2]

In enforcing regression, the ego scores its first success in its defensive struggle against the demands of the libido. (In this connection it is of advantage to distinguish the more general notion of 'defence' from 'repression'.[3] Repression is only one of the mechanisms which defence makes use of.) It is perhaps in obsessional cases more than in normal or hysterical ones that we can most clearly recognize that the motive force [*Motor*] of defence is the castration complex and that what is being fended off are the trends of the Oedipus complex. We are at present dealing with the beginning of the latency period, a period which is characterized by the dissolution of the Oedipus complex, the creation or consolidation of the superego and the erection of ethical and aesthetic barriers in the ego. In obsessional neuroses these processes are
[115] carried further than is normal. In addition to the destruction of the Oedipus complex a regressive degradation of the libido takes place, the superego becomes exceptionally severe and unkind, and the ego, in obedience to the superego, produces strong reaction-formations in the shape of conscientiousness, pity and cleanliness. Implacable, though not always on that account successful, severity is shown in condemning the temptation to continue early infantile masturbation, which now
Anlehnung attaches [*anlehnt*][T] itself to regressive (sadistic-anal) ideas but which nevertheless represents the unsubjugated part of the phallic organization. There is an inherent contradiction about this state of affairs, in which, precisely in the interests of masculinity (that is to say, from fear of castration), every activity belonging to masculinity is stopped. But here, too, obsessional neurosis is only overdoing the normal method of getting rid of the Oedipus complex. We once more find here an illustration of the truth that every exaggeration contains the seed of its own undoing. For, under the guise of obsessional acts, the masturbation that has been suppressed approaches ever more closely to satisfaction.

1 See my paper on 'The Disposition to Obsessional Neurosis' (1913*i*) [*RSE*, **12**, 315 f.].

2 [In Chapter IV of *The Ego and the Id* (1923*b*), ibid., **19**, 37, Freud had suggested that the advance from the sadistic-anal to the genital phase is conditioned by an accession of erotic components.]

3 [This is discussed at length below, in Addendum A (*c*), p. 144 f.]

The reaction-formations in the ego of the obsessional neurotic, which we recognize as exaggerations of normal character formation, should be regarded, I think, as yet another mechanism of defence and placed alongside of regression and repression. They seem to be absent or very much weaker in hysteria. Looking back, we can now get an idea of what is peculiar to the defensive process in hysteria. It seems that in it the process is limited to repression alone. The ego turns away from the disagreeable drive impulse, leaves it to pursue its course [*Ablauf*] in the unconscious, and takes no further part in its fortunes. This view cannot be absolutely correct, for we are acquainted with the case in which a hysterical symptom is at the same time a fulfilment of a penalty imposed by the superego; but it may describe a general characteristic of the behaviour of the ego in hysteria.

We can either simply accept it as a fact that in obsessional neurosis a superego of this severe kind emerges, or we can take the regression of the libido as the fundamental characteristic of the affection and attempt to relate the severity of the superego to it. And indeed the superego, originating as it does from the id, cannot dissociate itself from the regression and defusion of drive which have taken place there. We cannot be surprised if it becomes harsher, unkinder and more tormenting than where development has been normal. [116]

The chief task during the latency period seems to be the fending off of the temptation to masturbate. This struggle produces a series of symptoms which appear in a typical fashion in the most different individuals and which in general have the character of a ceremonial. It is a great pity that no-one has as yet collected them and systematically analysed them. Being the earliest products of the neurosis they should best be able to shed light on the mechanisms employed in its symptom-formation. They already exhibit the features which will emerge so disastrously if a serious illness follows. They tend to become attached to activities (which would later be carried out almost automatically) such as going to sleep, washing, dressing and walking about; and they tend also to repetition and waste of time. Why this should be so is at present not at all clear; but the sublimation of anal-erotic components plays an unmistakable part in it.

The advent of puberty opens a decisive chapter in the history of an obsessional neurosis. The genital organization which has been broken off in childhood starts again with great vigour. But, as we know, the sexual development in childhood determines what direction this new start at puberty will take. Not only will the early aggressive impulses

be reawakened; but a greater or lesser proportion of the new libidinal impulses – in bad cases the whole of them – will have to follow the course prescribed for them by regression and will emerge as aggressive and destructive tendencies. In consequence of the erotic trends being disguised in this way and owing to the powerful reaction-formations in the ego, the struggle against sexuality will henceforward be carried on under the banner of ethical principles. The ego will recoil with astonishment from promptings to cruelty and violence which enter consciousness from the id, and it has no notion that in them it is combating erotic wishes, including some to which it would not otherwise have taken exception. The overstrict superego insists all the more strongly on the suppression of sexuality, since this has assumed such repellent forms. Thus in obsessional neurosis the conflict is aggravated in two directions: the defensive forces become more
[117] intolerant and the forces that are to be fended off become more intolerable. Both effects are due to a single factor, namely, regression of the libido.

A good deal of what has been said may be objected to on the ground that the unpleasant obsessive ideas [*Zwangsvorstellung*] are themselves quite conscious. But there is no doubt that before becoming conscious they have been through the process of repression. In most of them the actual wording of the aggressive drive impulse is altogether unknown to the ego, and it requires a good deal of analytic work to make it conscious. What does penetrate into consciousness is usually only a distorted substitute which is either of a vague, dreamlike and indeterminate nature or so travestied as to be unrecognizable. Even where repression has not encroached upon the content of the aggressive impulse it has certainly got rid of its accompanying affective character. As a result, the aggressiveness appears to the ego not to be an impulsion but, as the patients themselves say, merely a 'thought' which awakens no feeling.[1] But the remarkable thing is that this is not the case. What happens is that the affect left out when the obsessional idea is perceived appears in a different place. The superego behaves as though repression had not occurred and as though it knew the real wording and full affective character of the aggressive impulse, and it treats the ego accordingly. The ego which, on the one hand, knows that it is innocent is obliged, on the other hand, to be aware of a sense of guilt and to carry a responsibility which it cannot account for. This state of affairs is, however, not so puzzling as it would seem at first sight. The behaviour of the superego

1 [For all of this, see the 'Rat Man' case history (1909*d*), *RSE*, **10**, 168 ff. and 129 *n*. 1.]

is perfectly intelligible, and the contradiction in the ego merely shows that it has shut out the id by means of repression while remaining fully accessible to the influence of the superego.[1] If it is asked why the ego does not also attempt to withdraw from the tormenting criticism of the superego, the answer is that it *does* manage to do so in a great number of instances. There are obsessional neuroses in which no sense of guilt whatever is present. In them, as far as can be seen, the ego has avoided becoming aware of it by instituting a fresh set of symptoms, penances or [118] restrictions of a self-punishing kind. These symptoms, however, represent at the same time a satisfaction of masochistic impulses which, in their turn, have been reinforced by regression.

Obsessional neurosis presents such a vast multiplicity of phenomena that no efforts have yet succeeded in making a coherent synthesis of all its variations. All we can do is to pick out certain typical correlations; but there is always the risk that we may have overlooked other uniformities of a no less important kind.

I have already described the general tendency of symptom-formation in obsessional neurosis. It is to give ever greater room to substitutive satisfaction at the expense of frustration [*Versagung*]. Symptoms which once stood for a restriction of the ego come later on to represent satisfactions as well, thanks to the ego's inclination to synthesis, and it is quite clear that this second meaning gradually becomes the more important of the two. The result of this process, which approximates more and more to a complete failure of the original purpose of defence, is an extremely restricted ego which is reduced to seeking satisfaction in the symptoms. The displacement of the distribution of forces in favour of satisfaction may have the dreaded final outcome of paralysing the will of the ego, which in every decision it has to make is almost as strongly impelled from the one side as from the other. The over-acute conflict between id and superego which has dominated the illness from the very beginning may assume such extensive proportions that the ego, unable to carry out its office of mediator, can undertake nothing which is not drawn into the sphere of that conflict.

1 Cf. Theodor Reik (1925), 51.

VI

[119] In the course of these struggles we come across two activities of the ego which form symptoms and which deserve special attention because they are obviously surrogates of repression and therefore well calculated to illustrate its purpose and technique. The fact that such auxiliary and substitutive techniques emerge may argue that true repression has met with difficulties in its functioning. If one considers how much more the ego is the scene of action of symptom-formation in obsessional neurosis than it is in hysteria and with what tenacity the ego clings to its relations to reality and to consciousness, employing all its intellectual faculties to that end – and indeed how the very process of thinking becomes hypercathected and erotized – then one may perhaps come to a better understanding of these variations of repression.

The two techniques I refer to are *undoing what has been done* [*Ungeschehenmachen*][T] and *isolating*.[I] The first of these has a wide range of application and goes back very far. It is, as it were, negative magic, and endeavours, by means of motor symbolism, to 'blow away' not merely the *consequences* of some event (or experience or impression) but the event itself. I choose the term 'blow away' advisedly, so as to remind the reader of the part played by this technique not only in neuroses but in magical acts, popular customs and religious ceremonies as well. In obsessional neurosis the technique of undoing what has been done is first met with in the 'diphasic' symptoms [pp. 100–1 above], in which one action is cancelled out by a second, so that it is as though neither action had taken place, whereas, in reality, both have. This aim of undoing is the second underlying motive [*Wurzel*] of obsessional ceremonials, the first being to take precautions in order to prevent the occurrence or recurrence of some particular event. The difference between the two is easily seen: the precautionary measures are rational, while trying to get rid of something by 'making it not to have happened' is irrational and in the nature of magic. It is, of course, to be suspected
[120] that the latter is the earlier motive [*Wurzel*] of the two and proceeds from the animistic attitude towards the environment. This endeavour to undo shades off into normal behaviour in the case in which a person

1 [Both these techniques are referred to in the 'Rat Man' analysis (1909*d*), *RSE*, **10**, 178–9 and 184. The first of them, in German '*ungeschehenmachen*', means literally 'making unhappened'.]

decides to regard an event as not having happened.[1] But whereas he will take no direct steps against the event, and will simply pay no further attention to it or its consequences, the neurotic person will try to make the past itself non-existent. He will try to repress it by motor means. The same purpose may perhaps account for the obsession for *repeating* [*Zwanges zur Wiederholung*][2] which is so frequently met with in this neurosis and the carrying out of which serves a number of contradictory intentions at once. When anything has not happened in the desired way it is undone by being repeated in a different way; and thereupon all the motives [*Motive*] that exist for lingering over such repetitions come into play as well. As the neurosis proceeds, we often find that the endeavour to undo a traumatic experience is a motive [*Motiv*] of first-rate importance in the formation of symptoms. We thus unexpectedly discover a new, motor technique of defence, or (as we may say in this case with less inaccuracy) of repression.

The second of these techniques which we are setting out to describe for the first time, that of isolation, is peculiar to obsessional neurosis. It, too, takes place in the motor sphere. When something unpleasant has happened to the subject or when he himself has done something which has a significance for his neurosis, he interpolates an interval during which nothing further must happen – during which he must perceive nothing and do nothing.[3] This behaviour, which seems strange at first sight, is soon seen to have a relation to repression. We know that in hysteria it is possible to cause a traumatic experience to be overtaken by amnesia. In obsessional neurosis this can often not be achieved: the experience is not forgotten, but, instead, it is deprived of its affect, and its associative connections are suppressed or interrupted so that it remains as though isolated and is not reproduced in the ordinary processes of thought. The effect of this isolation is the same as the effect of repression with amnesia. This technique, then, is reproduced in the isolations of obsessional neurosis; and it is at the same time given motor reinforcement for magical purposes. The elements that are held apart [121]
in this way are precisely those which belong together associatively. The motor isolation is meant to ensure an interruption of the connection in thought. The normal phenomenon of concentration provides a pretext for this kind of neurotic procedure: what seems to us important in the way of an impression or a piece of work must not be interfered with by

1 [In the original: 'as "*non arrivé*"'.]

2 [Literally 'compulsion to repetition'.]

3 [Cf. the 'Rat Man' (1909*d*), *RSE*, **10**, 186–7.]

the simultaneous claims of any other mental processes or activities. But even a normal person uses concentration to keep away not only what is irrelevant or unimportant, but, above all, what is unsuitable because it is contradictory. He is most disturbed by those elements which once belonged together but which have been torn apart in the course of his development – as, for instance, by manifestations of the ambivalence of his father complex in his relation to God, or by impulses [*Regungen*] attached to his excretory organs in his emotions of love. Thus, in the normal course of things, the ego has a great deal of isolating work to do in its function of directing the current of thought. And, as we know, we are obliged, in carrying out our analytic technique, to train it to relinquish that function for the time being, eminently justified as it usually is.

We have all found by experience that it is especially difficult for an obsessional neurotic to carry out the fundamental rule of psychoanalysis. His ego is more watchful and makes sharper isolations, probably because of the high degree of tension due to conflict that exists between his superego and his id. While he is engaged in thinking, his ego has to keep off too much – the intrusion of unconscious phantasies and the manifestation of ambivalent trends. It must not relax, but is constantly prepared for a struggle. It fortifies this compulsion [*Zwang*] to concentrate and to isolate by the help of the magical acts of isolation which, in the form of symptoms, grow to be so noticeable and to have so much practical importance for the patient, but which are, of course, useless in themselves and are in the nature of ceremonials.

But in thus endeavouring to prevent associations and connections of thought, the ego is obeying one of the oldest and most fundamental commands of obsessional neurosis, the taboo on touching. If we ask ourselves why the avoidance of touching, contact or contagion should play such a large part in this neurosis and should become the subject
[122] matter of complicated systems, the answer is that touching and physical contact are the immediate aim of the aggressive as well as the loving object cathexes.[1] Eros desires contact because it strives to make the ego and the loved object one, to abolish all spatial barriers between them. But destructiveness, too, which (before the invention of long-range weapons) could only take effect at close quarters, must presuppose physical contact, a coming to grips. To 'touch' a woman has become a euphemism for using her as a sexual object. Not to 'touch' one's genitals

1 [Cf. several passages in the second essay in *Totem and Taboo* (1912–13*a*), e.g. *RSE*, **13**, 33 ff. and 73.]

is the phrase employed for forbidding auto-erotic satisfaction. Since obsessional neurosis begins by persecuting erotic touching and then, after regression has taken place, goes on to persecute touching in the guise of aggressiveness, it follows that nothing is so strongly proscribed in that illness as touching nor so well suited to become the central point of a system of prohibitions. But isolating is removing the possibility of contact; it is a method of withdrawing a thing from being touched in any way. And when a neurotic isolates an impression or an activity by interpolating an interval, he is letting it be understood symbolically that he will not allow his thoughts about that impression or activity to come into associative contact with other thoughts.

This is as far as our investigations into the formation of symptoms take us. It is hardly worthwhile summing them up, for the results they have yielded are scanty and incomplete and tell us scarcely anything that we do not already know. It would be fruitless to turn our attention to symptom-formation in other disorders besides phobias, conversion hysteria and obsessional neurosis, for too little is known about them. But in reviewing those three neuroses together we are brought up against a very serious problem the consideration of which can no longer be put off. All three have as their outcome the destruction of the Oedipus complex; and in all three the motive force [*Motor*] of the ego's opposition is, we believe, the fear of castration [*Kastrationsangst*]. Yet it is only in the phobias that this fear [*Angst*] comes to the surface and is acknowledged. What has become of it in the other two neuroses? How has the ego spared itself this fear [*Angst*]? The problem becomes accentuated when we recall the possibility, already referred to, that anxiety [*Angst*] [123]
arises directly, by a kind of fermentation, from a libidinal cathexis whose processes have been disturbed. Furthermore, is it absolutely certain that fear of castration [*Kastrationsangst*] is the only motive force of repression (or defence)? If we think of neuroses in women we are bound to doubt it. For though we can with certainty establish in them the presence of a castration *complex*, we can hardly speak with propriety of castration *anxiety* where castration has already taken place.

VII

[124] Let us go back again to infantile phobias of animals; for, when all is said and done, we understand them better than any other cases. In animal phobias, then, the ego has to oppose a libidinal object cathexis coming from the id – a cathexis that belongs either to the positive or the negative Oedipus complex – because it believes that to give way to it would entail the danger of castration. This question has already been discussed, but there still remains a doubtful point to clear up. In 'Little Hans's' case – that is, in the case of a positive Oedipus complex – was it his fondness for his mother or was it his aggressiveness towards his father which called out the defence by the ego? In practice it seems to make no difference, especially as each set of feelings implies the other; but the question has a theoretical interest, since it is only the feeling of affection for the mother which can count as a purely erotic one. The aggressive impulse flows mainly from the destructive drive; and we have always believed that in a neurosis it is against the demands of the libido and not against those of any other drive that the ego is defending itself. In point of fact we know that after 'Hans's' phobia had been formed, his tender attachment to his mother seemed to disappear, having been completely disposed of by repression, while the formation of the symptom (the substitutive formation) took place in relation to his aggressive impulses. In the 'Wolf Man' the situation was simpler. The impulse that was repressed – his feminine attitude towards his father – was a genuinely erotic one; and it was in relation to that impulse that the formation of his symptoms took place.

It is almost humiliating that, after working so long, we should still be having difficulty in understanding the most fundamental facts. But we have made up our minds to simplify nothing and to hide nothing. If we cannot see things clearly we will at least see clearly what the obscurities are. What is hampering us here is evidently some hitch in the development of our theory of the drives. We began by tracing the organization of the libido through its successive stages – from the oral through the sadistic-anal to the genital – and in doing so placed all the components
[125] of the sexual drive on the same footing. Later it appeared that sadism was the representative of another drive, which was opposed to Eros. This new view, that the drives fall into two groups, seems to explode the earlier construction of the successive stages of libidinal

organization. But we do not have to break fresh ground in order to find a way out of the difficulty. The solution has been at hand for a long time and lies in the fact that what we are concerned with are scarcely ever pure drive impulses but mixtures in various proportions of the two groups of drives. If this is so, there is no need to revise our view of the organizations of the libido. A sadistic cathexis of an object may also legitimately claim to be treated as a libidinal one; and an aggressive impulse against the father can just as well be subjected to repression as a tender impulse towards the mother. Nevertheless, we shall bear in mind for future consideration the possibility that repression is a process which has a special relation to the *genital* organization of the libido and that the ego resorts to other methods of defence when it has to secure itself against the libido on other levels of organization. To continue: a case like 'Little Hans's' does not enable us to come to any clear conclusion. It is true that in him an aggressive impulse was disposed of by repression, but this happened after the genital organization had been reached.

This time we will not lose sight of the part played by anxiety. We have said that as soon as the ego recognizes the danger of castration it gives the signal of anxiety and inhibits through the pleasure–unpleasure agency (in a way which we cannot as yet understand) the impending cathectic process in the id. At the same time the phobia is formed. And now the castration anxiety is directed to a different object and expressed in a distorted form, so that the patient is afraid, not of being castrated by his father, but of being bitten by a horse or devoured by a wolf. This substitutive formation has two obvious advantages. In the first place it avoids a conflict due to ambivalence (for the father was a loved object, too), and in the second place it enables the ego to cease generating anxiety. For the anxiety belonging to a phobia is conditional; it emerges only when the object of it is perceived – and rightly so, since it is only then that the danger situation is present. There is no need to be afraid [*befürchten*] of being castrated by a father who is not there. On the other hand, one cannot get rid of a father; he can appear whenever [126]
he chooses. But if he is replaced by an animal, all one has to do is to avoid the sight of it – that is, its presence – in order to be free from danger and anxiety. 'Little Hans', therefore, imposed a restriction upon his ego. He produced the inhibition of not leaving the house, so as not to come across any horses. The young Russian had an even easier time of it, for it was hardly a privation for him not to look at a particular picture-book any more. If his naughty sister had not kept on showing

him the book with the picture of the wolf standing upright in it, he would have been able to feel safe from his fear [*Angst*].[1]

On a previous occasion I have stated that phobias have the character of a projection in that they replace an internal drive danger with an external perceptual one. The advantage of this is that the subject can protect himself against an external danger by fleeing from it and avoiding the perception of it, whereas it is useless to flee from dangers that arise from within.[2] This statement of mine was not incorrect, but it did not go below the surface of things. For a drive demand is, after all, not dangerous in itself; it becomes so only inasmuch as it entails a real external danger, the danger of castration. Thus what happens in a phobia in the last resort is merely that one external danger is replaced by another. The view that in a phobia the ego is able to escape anxiety by means of avoidance or of inhibitory symptoms fits in very well with the theory that that anxiety is only an affective signal and that no alteration has taken place in the economic situation.

The anxiety felt in animal phobias is, therefore, an affective reaction on the part of the ego to danger; and the danger which is being signalled in this way is the danger of castration. This anxiety differs in no respect from the realistic anxiety which the ego normally feels in situations of danger, except that its content remains unconscious and only becomes conscious in the form of a distortion.

The same will prove true, I think, of the phobias of adults, although
[127] the material which their neuroses work over is much more abundant and there are some additional factors in the formation of the symptoms. Fundamentally the position is identical. The agoraphobic patient imposes a restriction on his ego so as to escape a certain drive danger – namely, the danger of giving way to his erotic desires. For if he did so the danger of being castrated, or some similar danger, would once more be conjured up as it was in his childhood. I may cite as an instance the case of a young man who became agoraphobic because he was afraid of yielding to the solicitations of prostitutes and of contracting a syphilitic infection from them as a punishment.

I am well aware that a number of cases exhibit a more complicated structure and that many other repressed drive impulses can enter into a phobia. But they are only auxiliary impulses which have for the most part joined the nucleus of the neurosis at a later stage [*nachträglich*].

1 [*RSE*, **17**, 14.]

2 [See the account of phobias given in Section IV of Freud's metapsychological paper on 'The Unconscious' (1915*e*), ibid., **14**, 161–3. See also Editors' Introduction, p. 71 f. above.]

The symptomatology of agoraphobia is complicated by the fact that the ego does not confine itself to making a renunciation. In order to rob the situation of danger it does more: it usually effects a temporal regression[1] to infancy (in extreme cases, to a time when the subject was in his mother's womb and protected against the dangers which threaten him in the present). Such a regression now becomes a condition whose fulfilment exempts the ego from making its renunciation. For instance, an agoraphobic patient may be able to walk in the street provided he is accompanied, like a small child, by someone he knows and trusts; or, for the same reason, he may be able to go out alone provided he remains within a certain distance of his own house and does not go to places which are not familiar to him or where people do not know him. What these stipulations are will depend in each case on the infantile factors which dominate him through his neurosis. The phobia of being alone is unambiguous in its meaning, irrespective of any infantile regression: it is, ultimately, an endeavour to avoid the temptation to indulge in solitary masturbation. Infantile regression can, of course, take place only [128] when the subject is no longer a child.

A phobia generally sets in after a first anxiety attack has been experienced in specific circumstances, such as in the street or on a train or in solitude. Thereafter the anxiety is held in ban by the phobia, but it re-emerges whenever the protective condition cannot be fulfilled. The mechanism of phobia does good service as a means of defence and tends to be very stable. A continuation of the defensive struggle, in the shape of a struggle against the symptom, occurs frequently but not invariably.

What we have learnt about anxiety in phobias is applicable to obsessional neuroses as well. In this respect it is not difficult for us to put obsessional neuroses on all fours with phobias. In the former, the mainspring of all later symptom-formation is clearly the ego's fear of its superego. The danger situation from which the ego must get away is the hostility of the superego. There is no trace of projection here; the danger is completely internalized. But if we ask ourselves what it is that the ego fears from the superego, we cannot but think that the punishment threatened by the latter must be an extension of the punishment of castration. Just as the father has become depersonalized in the shape of the superego, so has the fear of castration at his hands become

1 [The term 'temporal regression' is used by Freud very rarely. It appears at the beginning of the fifth of his Clark University lectures (1910*a*), *RSE*, **11**, 47, in a paragraph added in 1914 to *The Interpretation of Dreams* (1900*a*), ibid., **5**, 490, and in a passage in the metapsychological paper on dreams (1916–17*f* [1915]), ibid., **14**, 197–8.]

transformed into an undefined social or moral anxiety.[1] But this anxiety is concealed. The ego escapes it by obediently carrying out the commands, precautions and penances that have been enjoined on it. If it is impeded in doing so, it is at once overtaken by an extremely distressing feeling of discomfort [*Unbehagen*] which may be regarded as an equivalent of anxiety and which the patients themselves liken to anxiety.

The conclusion we have come to, then, is this. Anxiety is a reaction to a situation of danger. It is obviated by the ego's doing something to
[129] avoid that situation or to withdraw from it. It might be said that symptoms are created so as to avoid the generating of anxiety. But this does not go deep enough. It would be truer to say that symptoms are created so as to avoid a *danger situation* whose presence has been signalled by the generation of anxiety. In the cases that we have discussed, the danger concerned was the danger of castration or of something traceable back to castration.

If anxiety is a reaction of the ego to danger, we shall be tempted to regard the traumatic neuroses, which so often follow upon a narrow escape from death, as a direct result of a fear of death (or fear *for* life) and to dismiss from our minds the question of castration and the dependent relationships of the ego [p. 85 above]. Most of those who observed the traumatic neuroses that occurred during the last war[2] took this line, and triumphantly announced that proof was now forthcoming that a threat to the self-preservative drive could by itself produce a neurosis without any admixture of sexual factors and without requiring any of the complicated hypotheses of psychoanalysis. It is in fact greatly to be regretted that not a single analysis of a traumatic neurosis of any value is extant.[3] And it is to be regretted, not because such an analysis would contradict the aetiological importance of sexuality – for any such contradiction has long since been disposed of by the introduction of the concept of narcissism, which brings the libidinal cathexis of the ego into line with the cathexes of objects and emphasizes the libidinal character
Selbsterhaltung of the drive to self-preservation [*Selbsterhaltungstriebes*][T] – but because, in the absence of any analyses of this kind, we have lost a most precious

1 ['*Gewissensangst*', literally 'conscience anxiety'. This word is a cause of constant trouble to the translator. In ordinary usage it means no more than 'qualms of conscience'. But often in Freud, as in the present passage, stress is laid on the factor of anxiety in the concept. Sometimes, even, it might be rendered 'fear of conscience' where the distinction between 'conscience' and 'superego' is not sharply drawn. The fullest discussion of these questions can be found in Chapters VII and VIII of *Civilization and its Discontents* (1930*a*), *RSE*, **21**, 115 f. and 128.]

2 [The First World War.]

3 [See Freud's discussion of the war neuroses (1919*d*), ibid., **17**, 203.]

opportunity of drawing decisive conclusions about the relations between anxiety and the formation of symptoms. In view of all that we know about the structure of the comparatively simple neuroses of everyday life, it would seem highly improbable that a neurosis could come into being merely because of the objective presence of danger, without any participation of the deeper levels of the mental apparatus. But the unconscious seems to contain nothing that could give any content to our concept of the annihilation of life. Castration can be pictured on the basis of the daily experience of the faeces being separated from the body or on the basis of losing the mother's breast at weaning.[1] But nothing resembling death can ever have been experienced; or if it has, as in fainting, it has left no observable traces behind. I am therefore inclined to adhere to the view that the fear of death should be regarded as analogous to the fear of castration and that the situation to which the ego is reacting is one of being abandoned by the protecting superego – the powers of destiny – so that it has no longer any safeguard against all the dangers that surround it.[2] In addition, it must be remembered that in the experiences which lead to a traumatic neurosis the protective shield against external stimuli is broken through and excessive amounts of excitation impinge upon the mental apparatus [cf. p. 84 above]; so that we have here a second possibility – that anxiety is not only being signalled as an affect but is also being freshly created out of the economic conditions of the situation. [130]

The statement I have just made, to the effect that the ego has been prepared to expect castration by having undergone constantly repeated object losses, places the question of anxiety in a new light. We have hitherto regarded it as an affective signal of danger; but now, since the danger is so often one of castration, it appears to us as a reaction to a loss, a separation. Even though a number of considerations immediately arise which make against this view, we cannot but be struck by one very remarkable correlation. The first experience of anxiety which an individual goes through (in the case of human beings, at all events) is birth, and, objectively speaking, birth is a separation from the mother. It could be compared to a castration of the mother (by equating the child with a penis). Now it would be very satisfactory if anxiety, as a symbol of a separation, were to be repeated on every subsequent occasion on which a separation took place. But unfortunately we are prevented from making use of this correlation by the fact that birth is

1 [See a footnote added in 1923 to the 'Little Hans' case history, *RSE*, **10**, 7–8 *n.* 3.]

2 [Cf. the last few paragraphs of *The Ego and the Id* (1923*b*), ibid., **19**, 51 ff., and below, p. 124.]

not experienced subjectively as a separation from the mother, since the foetus, being a completely narcissistic creature, is totally unaware of her existence as an object. Another adverse argument is that we know
[131] what the affective reactions to a separation are: they are pain [*Schmerz*] and mourning [*Trauer*][1], not anxiety. Incidentally, it may be remembered that in discussing the question of mourning we also failed to discover why it should be such a painful thing.[2]

1 [Alongside the psychological process of 'mourning', *Trauer* also denotes the simpler affective states of 'grief', 'sorrow' and 'sadness'.]

2 [See 'Mourning and Melancholia' (1916–17*g* [1915]), *RSE*, **14**, 218–19. Freud returns to this subject in Addendum C, p. 149 ff. below.]

VIII

The time has come to pause and consider. What we clearly want is to find something that will tell us what anxiety really is, some criterion that will enable us to distinguish true statements about it from false ones. But this is not easy to get. Anxiety is not so simple a matter. Up till now we have arrived at nothing but contradictory views about it, none of which can, to the unprejudiced eye, be given preference over the others. I therefore propose to adopt a different procedure. I propose to assemble, quite impartially, all the facts that we know about anxiety without expecting to arrive at a fresh synthesis. [132]

Anxiety, then, is in the first place something that is felt. We call it an affective state, although we are also ignorant of what an affect is. As a feeling, anxiety has a very marked character of unpleasure. But that is not the whole of its quality. Not every unpleasure can be called anxiety, for there are other feelings, such as tension, pain or mourning,[1] which have the character of unpleasure. Thus anxiety must have other distinctive features besides this quality of unpleasure. Can we succeed in understanding the differences between these various unpleasurable affects?

We can at any rate note one or two things about the feeling of anxiety. Its unpleasurable character seems to have a note of its own – something not very obvious, whose presence is difficult to prove yet which is in all likelihood there. But besides having this special feature which is difficult to isolate, we notice that anxiety is accompanied by fairly definite physical sensations which can be referred to particular organs of the body. As we are not concerned here with the physiology of anxiety, we shall content ourselves with mentioning a few representatives [*Repräsentanten*] of these sensations. The clearest and most frequent ones are those connected with the respiratory organs and with the heart.[2] They provide evidence that motor innervations – that is, processes of discharge – play a part in the general phenomenon of anxiety.

Analysis of anxiety states therefore reveals the existence of (1) a specific character of unpleasure, (2) acts of discharge and (3) perceptions of those acts. The two last points indicate at once a difference between [133]

1 [See footnote 1, p. 116 above.]

2 [Cf. paragraph 3 of Section I of Freud's first paper on anxiety neurosis (1895*b*), *RSE*, **3**, 84.]

states of anxiety and other similar states, like those of mourning and pain. The latter do not have any motor manifestation; or if they have, the manifestation is not an integral part of the whole state but is distinct from it as being a result of it or a reaction to it. Anxiety, then, is a special state of unpleasure with acts of discharge along particular paths. In accordance with our general views[1] we should be inclined to think that anxiety is based upon an increase of excitation which, on the one hand, produces the character of unpleasure and, on the other, finds relief through the acts of discharge already mentioned. But a purely physiological account of this sort will scarcely satisfy us. We are tempted to assume the presence of a historical factor which binds the sensations of anxiety and its innervations firmly together. We assume, in other words, that an anxiety state is the reproduction of some experience which contained the necessary conditions for such an increase of excitation and a discharge along particular paths, and that from this circumstance the unpleasure of anxiety receives its specific character. In man, birth provides a prototypic experience of this kind, and we are therefore inclined to regard anxiety states as a reproduction of the trauma of birth. [See above, p. 83 f.]

This does not imply that anxiety occupies an exceptional position among the affective states. In my opinion, the other affects are also reproductions of very early, perhaps even pre-individual, experiences of vital importance; and I should be inclined to regard them as universal, typical and innate hysterical attacks, as compared to the recently and individually acquired attacks which occur in hysterical neuroses and whose origin and significance as mnemic symbols have been revealed by analysis. It would be very desirable, of course, to be able to demonstrate the truth of this view in a number of such affects – a thing which is still very far from being the case.[2]

[134] The view that anxiety goes back to the event of birth raises immediate objections which have to be met. It may be argued that anxiety is a reaction which, in all probability, is common to every organism, certainly every organism of a higher order, whereas birth is only

1 [As expressed, for instance, in the opening pages of *Beyond the Pleasure Principle* (1920*g*), *RSE*, **18**, 7 ff.]

2 [This notion is probably derived from Darwin's *Expression of the Emotions* (1872), which was quoted by Freud in a similar connection in *Studies on Hysteria* (1895*d*), *RSE*, **2**, 161. See Editors' Introduction, p. 74 above. The nature of affects had been discussed in 'The Unconscious' (1915*e*), *RSE*, **14**, 157–8, and also (more clearly) in Lecture XXV of the *Introductory Lectures* (1916–17*a*), ibid., **16**, 349, where – as here – Freud seems to use 'affects' to denote what are now called 'basic emotions' (i.e. instinctual emotions). Freud saw primal phantasies as the human equivalents of 'instincts' in animals, and believed them to be literally inherited memories.]

experienced by the mammals; and it is doubtful whether in all of them, even, birth has the significance of a trauma. Therefore there can be anxiety without the prototype of birth. But this objection takes us beyond the barrier that divides psychology from biology. It may be that, precisely because anxiety has an indispensable biological function to fulfil as a reaction to a state of danger, it is differently contrived in different organisms. We do not know, besides, whether anxiety involves the same sensations and innervations in organisms far removed from man as it does in man himself. Thus there is no good argument here against the view that, in man, anxiety is modelled upon the process of birth.

If the structure and origin of anxiety are as described, the next question is: what is the function of anxiety and on what occasions is it reproduced? The answer seems to be obvious and convincing: anxiety arose originally as a reaction to a state of *danger* and it is reproduced whenever a state of that kind recurs.

This answer, however, raises further considerations. The innervations involved in the original state of anxiety probably had a meaning and purpose, in just the same way as the muscular movements which accompany a first hysterical attack. In order to understand a hysterical attack, all one has to do is to look for the situation in which the movements in question formed part of an appropriate and expedient action. Thus at birth it is probable that the innervation, in being directed to the respiratory organs, is preparing the way for the activity of the lungs, and, in accelerating the heartbeat, is helping to keep the blood free from toxic substances. Naturally, when the anxiety state is reproduced later as an affect it will be lacking in any such expediency, just as are the repetitions of a hysterical attack. When the individual is placed in a new situation of danger it may well be quite inexpedient for him to respond with an anxiety state (which is a reaction to an earlier danger) instead of initiating a reaction appropriate to the current danger. But his behaviour may become expedient once more if the danger situation is [135]
recognized as it approaches and is signalled by an outbreak of anxiety. In that case he can at once get rid of his anxiety by having recourse to more suitable measures. Thus we see that there are two ways in which anxiety can emerge: in an inexpedient way, when a new situation of danger has occurred, or in an expedient way in order to give a signal and prevent such a situation from occurring.

But what is a 'danger'? In the act of birth there is a real danger to life. We know what this means objectively; but in a psychological sense it

says nothing at all to us. The danger of birth has as yet no psychical content. We cannot possibly suppose that the foetus has any sort of knowledge that there is a possibility of its life being destroyed. It can only be aware of some vast disturbance in the economy of its narcissistic libido. Large sums of excitation crowd in upon it, giving rise to new kinds of feelings of unpleasure, and some organs acquire an increased cathexis, thus foreshadowing the object cathexis which will soon set in. What elements in all this will be made use of as the sign of a 'danger situation'?

Unfortunately far too little is known about the mental make-up of a newborn baby to make a direct answer possible. I cannot even vouch for the validity of the description I have just given. It is easy to say that the baby will repeat its affect of anxiety in every situation which recalls the event of birth. The important thing to know is what recalls the event and what it is that is recalled.

All we can do is to examine the occasions on which infants in arms or somewhat older children show readiness to produce anxiety. In his book on the trauma of birth, Rank (1924) has made a determined attempt to establish a relationship between the earliest phobias of children and the impressions made on them by the event of birth. But I do not think he has been successful. His theory is open to two objections. In the first place, he assumes that the infant has received certain sensory impressions, in particular of a visual kind, at the time of birth, the renewal of which can recall to its memory the trauma of birth and thus evoke a reaction of anxiety. This assumption is quite unfounded and extremely improbable. It is not credible that a child should retain any but tactile and general sensations relating to the process of birth. If, later on, children show fear of small animals that disappear into holes or emerge [136] from them, this reaction, according to Rank, is due to their perceiving an analogy. But it is an analogy of which they cannot be aware. In the second place, in considering these later anxiety situations Rank dwells, as suits him best, now on the child's recollection of its happy intrauterine existence, now on its recollection of the traumatic disturbance which interrupted that existence – which leaves the door wide open for arbitrary interpretation. There are, moreover, certain examples of childhood anxiety which directly traverse his theory. When, for instance, a child is left alone in the dark one would expect it, according to his view, to welcome the re-establishment of the intrauterine situation; yet it is precisely on such occasions that the child reacts with anxiety. And if this is explained by saying that the child is being

reminded of the interruption which the event of birth made in its intra-uterine happiness, it becomes impossible to shut one's eyes any longer to the far-fetched character of such explanations.[1]

I am driven to the conclusion that the earliest phobias of infancy cannot be directly traced back to impressions of the act of birth and that so far they have not been explained. A certain preparedness in the form of anxiety is undoubtedly present in the infant in arms. But this preparedness of anxiety, instead of being at its maximum immediately after birth and then slowly decreasing, does not emerge till later, as mental development proceeds, and lasts over a certain period of childhood. If these early phobias persist beyond that period one is inclined to suspect the presence of a neurotic disturbance, although it is not at all clear what their relation is to the undoubted neuroses that appear later on in childhood.

Only a few of the manifestations of anxiety in children are comprehensible to us, and we must confine our attention to them. They occur, for instance, when a child is alone, or in the dark,[2] or when it finds itself with an unknown person instead of one to whom it is used – such as its mother. These three instances can be reduced to a single condition – namely, that of missing someone who is loved and longed for. But here, I think, we have the key to an understanding of anxiety and to a reconciliation of the contradictions that seem to beset it. [137]

The child's mnemic image of the person longed for is no doubt intensely cathected, probably in a hallucinatory way at first. But this has no effect; and now it seems as though the longing turns into anxiety. This anxiety has all the appearance of being an expression of the child's feeling at its wits' end, as though in its still very undeveloped state it did not know how better to cope with its cathexis of longing. Here anxiety appears as a reaction to the felt loss of the object; and we are at once reminded of the fact that castration anxiety, too, is a fear of being separated from a highly valued object, and that the earliest anxiety of all – the 'primal anxiety' of birth – is brought about on the occasion of a separation from the mother.

But a moment's reflection takes us beyond this question of loss of object. The reason why the infant in arms wants to perceive the presence of its mother is only because it already knows by experience that she satisfies all its needs without delay. The situation, then, which it regards as a 'danger' and against which it wants to be safeguarded is

1 [Rank's theory is further discussed below, p. 133 ff.]

2 [Cf. a footnote to Section 5 of the third of Freud's *Three Essays* (1905*d*), *RSE*, **7**, 198 *n.* 1.]

that of non-satisfaction, of a *growing tension due to need*, against which it is helpless. I think that if we adopt this view all the facts fall into place. The situation of non-satisfaction in which the amounts of stimulation rise to an unpleasurable height without its being possible for them to be mastered psychically or discharged must for the infant be analogous to the experience of being born – must be a repetition of the situation of danger. What both situations have in common is the economic disturbance caused by an accumulation of amounts of stimulation which need to be disposed of. It is this factor, then, which is the real essence of the 'danger'. In both cases the reaction of anxiety sets in. (This reaction is still an expedient one in the infant in arms, for the discharge, being directed into the respiratory and vocal muscular apparatus, now calls its mother to it, just as it activated the lungs of the newborn baby to get rid of the internal stimuli.) It is unnecessary to suppose that the child carries anything more with it from the time of its birth than this way of indicating the presence of danger.

When the infant has found out by experience that an external, perceptible object can put an end to the dangerous situation which is [138] reminiscent of birth, the content of the danger it fears is displaced from the economic situation on to the condition which determined that situation, viz. the loss of object. It is the absence of the mother that is now the danger; and as soon as that danger arises the infant gives the signal of anxiety, before the dreaded economic situation has set in. This change constitutes a first great step forward in the provision made by the infant for its self-preservation, and at the same time represents a transition from the automatic and involuntary fresh appearance of anxiety to the intentional reproduction of anxiety as a signal of danger.

In these two aspects, as an automatic phenomenon and as a rescuing signal, anxiety is seen to be a product of the infant's mental helplessness which is a natural counterpart of its biological helplessness. The striking coincidence by which the anxiety of the newborn baby and the anxiety of the infant in arms are both conditioned by separation from the mother does not need to be explained on psychological lines. It can be accounted for simply enough biologically; for, just as the mother originally satisfied all the needs of the foetus through the apparatus of her own body, so now, after its birth, she continues to do so, though partly by other means. There is much more continuity between intrauterine life and earliest infancy than the impressive caesura[1] of the act of birth would have us believe. What happens is that the child's biological

1 ['*Caesur*.' In the 1926 German edition only, this was misprinted '*Censur* (censorship)'.]

situation as a foetus is replaced for it by a psychical object relation to its mother. But we must not forget that during its intrauterine life the mother was not an object for the foetus, and that at that time there were no objects at all. It is obvious that in this scheme of things there is no place for the abreaction of the birth trauma. We cannot find that anxiety has any function other than that of being a signal for the avoidance of a danger situation.

The significance of the loss of object as a determinant of anxiety extends considerably further. For the next transformation of anxiety, viz. the castration anxiety belonging to the phallic phase, is also a fear of separation and is thus attached to the same determinant. In this case [139]
the danger is of being separated from one's genitals. Ferenczi [1925] has traced, quite correctly, I think, a clear line of connection between this fear and the fears contained in the earlier situations of danger. The high degree of narcissistic value which the penis possesses can appeal to the fact that that organ is a guarantee to its owner that he can be once more united with his mother – i.e. with a substitute for her – in the act of copulation. Being deprived of it amounts to a renewed separation from her, and this in its turn means being helplessly exposed to an unpleasurable tension due to drive need, as was the case at birth. But the need whose increase is feared is now a specific one belonging to the genital libido and is no longer an indeterminate one, as it was in the period of infancy. It may be added that for a man who is impotent (that is, who is inhibited by the threat of castration) the substitute for copulation is a phantasy of returning into his mother's womb. Following Ferenczi's line of thought, we might say that the man in question, having tried to bring about his return into his mother's womb by using his genital organ to represent him, is now [in this phantasy] replacing that organ regressively with his whole person.[1]

The progress which the child makes in its development – its growing independence, the sharper division of its mental apparatus into several agencies, the advent of new needs – cannot fail to exert an influence upon the content of the danger situation. We have already traced the change of that content from loss of the mother as an object to castration. The next change is caused by the power [*Macht*] of the superego. With the depersonalization of the parental agency from which castration was feared, the danger becomes less defined. Castration anxiety develops into moral anxiety – social anxiety – and it is not so easy now to know what the anxiety is about. The formula, 'separation and expulsion from

1 [Freud had already discussed this phantasy in the 'Wolf Man' analysis (1918*b*), *RSE*, **17**, 89–92.]

the horde', applies only to that later portion of the superego which has been formed on the basis of [*in Anlehnung an*] social prototypes, not to the nucleus of the superego, which corresponds to the introjected parental agency. Putting it more generally, what the ego regards as the danger
[140] and responds to with an anxiety signal is that the superego should be angry with it or punish it or cease to love it. The final transformation which the fear of the superego undergoes is, it seems to me, the fear of death (or fear for life) which is a fear of the superego projected on to the powers of destiny.[1]

At one time I attached some importance to the view that what was used as a discharge of anxiety was the cathexis which had been withdrawn in the process of repression.[2] Today this seems to me of scarcely any interest. The reason for this is that, whereas I formerly believed that anxiety invariably arose automatically by an economic process, my present conception of anxiety as a signal given by the ego in order to affect the pleasure–unpleasure agency does away with the necessity of considering the economic factor. Of course there is nothing to be said against the idea that it is precisely the energy that has been liberated by being withdrawn through repression which is used by the ego to arouse the affect; but it is no longer of any importance which portion of energy is employed for this purpose. [Cf. Editors' Introduction, p. 71 above.]

This new view of things calls for an examination of another assertion of mine – namely, that the ego is the actual seat of anxiety.[3] I think this proposition still holds good. There is no reason to assign any manifestation of anxiety to the superego; while the expression 'anxiety of the id' would stand in need of correction, though rather as to its form than its substance. Anxiety is an affective state and as such can, of course, only be felt by the ego. The id cannot have anxiety as the ego can; for it is not an organization and cannot make a judgement about situations of danger. On the other hand, it very often happens that processes take place or begin to take place in the id which cause the ego to produce anxiety. Indeed, it is probable that the earliest repressions as well as most of the later ones are motivated [*motiviert*] by an ego anxiety of this sort in regard to particular processes in the id. Here again we are rightly distinguishing between two cases: the case in which something

1 [Cf. above, p. 115.]

2 [See, for instance, Section IV of Freud's metapsychological paper on 'The Unconscious' (1915*e*), *RSE*, **14**, 161–2.]

3 [This can be found in *The Ego and the Id* (1923*b*), ibid., **19**, 51.]

occurs in the id which activates one of the danger situations for the ego and induces the latter to give the anxiety signal for inhibition to take [141]
place, and the case in which a situation analogous to the trauma of birth is established in the id and an automatic reaction of anxiety ensues. The two cases may be brought closer together if it is pointed out that the second case corresponds to the earliest and original danger situation, while the first case corresponds to any one of the later determinants of anxiety that have been derived from it; or, as applied to the disorders which we in fact come across, that the second case is operative in the aetiology of the 'actual' neuroses, while the first remains typical for that of the psychoneuroses.

We see, then, that it is not so much a question of taking back our earlier findings as of bringing them into line with more recent discoveries. It is still an undeniable fact that in sexual abstinence, in improper interference with the course [*Ablauf*] of sexual excitation or if the latter is diverted from being worked over psychically,[1] anxiety arises directly out of libido; in other words, that the ego is reduced to a state of helplessness in the face of an excessive tension due to need, as it was in the situation of birth, and that anxiety is then generated. Here once more, though the matter is of little importance, it is very possible that what finds discharge in the generating of anxiety is precisely the surplus of unutilized libido.[2] As we know, a psychoneurosis is especially liable to develop on the basis of an 'actual' neurosis. This looks as though the ego were attempting to save itself from anxiety, which it has learnt to keep in suspension for a while, and to bind it by the formation of symptoms. Analysis of the traumatic war neuroses – a term which, incidentally, covers a great variety of disorders – would probably have shown that a number of them possess some characteristics of the 'actual' neuroses. [Cf. above, p. 114.]

In describing the evolution of the various danger situations from their prototype, the act of birth, I have had no intention of asserting that every later determinant of anxiety completely invalidates the preceding one. It is true that, as the development of the ego goes on, the earlier [142]
danger situations tend to lose their force and to be set aside, so that we might say that each period of the individual's life has its appropriate determinant of anxiety. Thus the danger of psychical helplessness is

1 ['*psychischen Verarbeitung*', literally 'psychical working over'. The phrase can be found in Section III of Freud's first paper on anxiety neurosis (1895*b*), *RSE*, **3**, 98, of which the whole of the present passage is an echo.]

2 [Cf. the similar remark at the end of the last paragraph but one, but see also the Editors' Introduction, p. 71 above.]

appropriate to the period of life when his ego is immature; the danger of loss of object, to early childhood when he is still dependent on others; the danger of castration, to the phallic phase; and the fear of his super-ego, to the latency period. Nevertheless, all these danger situations and determinants of anxiety can persist side by side and cause the ego to react to them with anxiety at a period later than the appropriate one; or, again, several of them can come into operation at the same time. It is possible, moreover, that there is a fairly close relationship between the danger situation that is operative and the form taken by the ensuing neurosis.[1]

[143] When, in an earlier part of this discussion, we found that the danger of castration was of importance in more than one neurotic illness, we put ourselves on guard against overestimating that factor, since it could not be a decisive one for the female sex, who are undoubtedly more subject to neuroses than men. [See p. 109 above.] We now see that there is no danger of our regarding castration anxiety as the sole motive force [*Motor*] of the defensive processes which lead to neurosis. I have shown elsewhere[2] how little girls, in the course of their development, are led into making a tender object cathexis by their castration complex. It is precisely in women that the danger situation of loss of object seems to have remained the most effective. All we need to do is to make a slight modification in our description of their determinant of anxiety, in the

1 Since the differentiation of the ego and the id, our interest in the problems of repression, too, was bound to receive a fresh impetus. Up till then we had been content to confine our interest to those aspects of repression which concerned the ego – the keeping away from consciousness and from motility, and the formation of substitutes (symptoms). With regard to the repressed drive impulses themselves, we assumed that they remained unaltered in the unconscious for an indefinite length of time. But now our interest is turned to the vicissitudes [*Schicksalen*][T] of the repressed and we begin to suspect that it is not self-evident, perhaps not even usual, that those impulses should remain unaltered and unalterable in this way. There is no doubt that the original impulses have been inhibited and deflected from their aim through repression. But has the portion of them in the unconscious maintained itself and been proof against the influences of life that tend to alter and depreciate them? In other words, do the old wishes, about whose former existence analysis tells us, still exist? The answer seems ready to hand and certain. It is that the old, repressed wishes must still be present in the unconscious since we still find their derivatives, the symptoms, in operation. But this answer is not sufficient. It does not enable us to decide between two possibilities: either that the old wish is now operating only through its derivatives, having transferred the whole of its cathectic energy to them, or that it is itself still in existence too. If its fate has been to exhaust itself in cathecting its derivatives, there is yet a third possibility. In the course of the neurosis it may have become reanimated by regression, anachronistic though it may now be. These are no idle speculations. There are many things about mental life, both normal and pathological, which seem to call for the raising of such questions. In my paper 'The Dissolution of the Oedipus Complex' (1924*d*) [*RSE*, **19**, 167 ff.], I had occasion to notice the difference between the mere repression and the real removal of an old wishful impulse.

2 [See the second half of the paper on the consequences of the anatomical distinction between the sexes (1925*j*), ibid., **19**, 252 ff.]

sense that it is no longer a matter of feeling the want of, or actually losing the object itself, but of losing the object's love. Since there is no doubt that hysteria has a strong affinity with femininity, just as obsessional neurosis has with masculinity,[1] it appears probable that, as a determinant of anxiety, loss of love plays much the same part in hysteria as the threat of castration does in phobias and fear of the superego in obsessional neurosis.

1 [Freud had pointed this out thirty years earlier, near the end of his French paper on 'Heredity and the Aetiology of the Neuroses' (1896*a*), *RSE*, **3**, 164.]

IX

[144] What is now left for us is to consider the relationship between the formation of symptoms and the generating of anxiety.

There seem to be two very widely held opinions on this subject. One is that anxiety is itself a symptom of neurosis. The other is that there is a much more intimate relation between the two.[1] According to the second opinion, symptoms are formed only in order to avoid anxiety: they bind the psychical energy which would otherwise be discharged as anxiety. Thus anxiety would be the fundamental phenomenon and main problem of neurosis.

That this latter opinion is at least in part true is shown by some striking examples. If an agoraphobic patient who has been accompanied into the street is left alone there, he will produce an anxiety attack. Or if an obsessional neurotic is prevented from washing his hands after having touched something, he will become prey to almost unbearable anxiety. It is plain, then, that the purpose and the result of the imposed condition of being accompanied in the street and the obsessional act of washing the hands were to obviate outbreaks of anxiety of this kind. In this sense every inhibition which the ego imposes on itself can be called a symptom.

Since we have traced back the generating of anxiety to a situation of danger, we shall prefer to say that symptoms are created in order to remove the ego from a situation of danger. If the symptoms are prevented from being formed, the danger does, in fact, materialize; that is, a situation analogous to birth is established in which the ego is helpless in the face of a constantly increasing drive demand – the earliest and original determinant of anxiety. Thus in our view the relation between anxiety and symptom is less close than was supposed, for we have inserted the factor of the danger situation between them. We can also add that the generating of anxiety sets symptom-formation going and is, indeed, a necessary prerequisite of it. For if the ego did not arouse the pleasure–unpleasure agency by generating anxiety, it would not obtain the power to arrest the process which is preparing in the id and
[145] which threatens danger. There is in all this an evident inclination to limit to a minimum the amount of anxiety generated and to employ it only as a signal; for to do otherwise would only result in feeling in

1 [I.e. between anxiety and symptom.]

another place the unpleasure which the drive process was threatening to produce, and that would not be a success from the standpoint of the pleasure principle, although it is one that occurs often enough in the neuroses.

Symptom-formation, then, does in fact put an end to the danger situation. It has two aspects: one, hidden from view, brings about the alteration in the id by virtue of which the ego is removed from danger; the other, presented openly, shows what has been created in place of the drive process that has been affected – namely, the substitutive formation.

It would, however, be more correct to ascribe to the *defensive process* what we have just said about symptom-formation and to use the latter term as synonymous with substitute formation. It will then be clear that the defensive process is analogous to the flight by means of which the ego removes itself from a danger that threatens it from outside. The defensive process is an attempt at flight from a drive danger. An examination of the weak points in this comparison will make things clearer.

One objection to it is that loss of an object (or loss of love on the part of the object) and the threat of castration are just as much dangers coming from outside as, let us say, a ferocious animal would be; they are not drive dangers. Nevertheless, the two cases are not the same. A wolf would probably attack us irrespectively of our behaviour towards it; but the loved person would not cease to love us nor should we be threatened with castration if we did not entertain certain feelings and intentions within us. Thus such drive impulses are determinants of external dangers and so become dangerous in themselves; and we can now proceed against the external danger by taking measures against the internal ones. In phobias of animals the danger seems to be still felt entirely as an external one, just as it has undergone an external displacement in the symptom. In obsessional neuroses the danger is much more internalized. That portion of anxiety in regard to the superego which constitutes *social* anxiety still represents an internal substitute for an external danger, while the other portion – *moral* anxiety [*Gewissensangst*][t] – is already completely endopsychic.[1] [146]

Another objection is that in an attempt at flight from an impending external danger all that the subject is doing is to increase the distance

1 [Much of the present discussion is a reassessment of the arguments which Freud had used in his metapsychological papers on 'Repression' (1915*d*) and 'The Unconscious' (1915*e*). See, in particular, *RSE*, **14**, 135–7 and 161–3. – For 'moral anxiety', cf. footnote 1, p. 114 above.]

between himself and what is threatening him. He is not preparing to defend himself against it or attempting to alter anything about it, as would be the case if he attacked the wolf with a stick or shot at it with a gun. But the defensive process seems to do something more than would correspond to an attempt at flight. It joins issue with the threatening drive process and somehow suppresses it or deflects it from its aims and thus renders it innocuous. This objection seems unimpeachable and must be given due weight. I think it is probable that there are some defensive processes which can truly be likened to an attempt at flight, while in others the ego takes a much more active line of self-protection and initiates vigorous countermeasures. But perhaps the whole analogy between defence and flight is invalidated by the fact that both the ego and the drive in the id are parts of the same organization, not separate entities like the wolf and the child, so that any kind of behaviour on the part of the ego will result in an alteration in the drive process as well.

This study of the determinants of anxiety has, as it were, shown the defensive behaviour of the ego transfigured in a rational light. Each situation of danger corresponds to a particular period of life or a particular developmental phase of the mental apparatus and appears to be justifiable for it. In early infancy the individual is really not equipped to master psychically the large sums of excitation that reach him whether from without or from within. Again, at a certain period of life his most important interest really is that the people he is dependent on should not withdraw their loving care of him. Later on in his boyhood, when he feels that his father is a powerful rival in regard to his mother and becomes aware of his own aggressive inclinations towards him and of his sexual intentions towards his mother, he really is justified in being
[147] afraid of his father; and his fear of being punished by him can find expression through phylogenetic reinforcement in the fear of being castrated. Finally, as he enters into social relationships, it really is necessary for him to be afraid of his superego, to have a conscience; and the absence of that factor would give rise to severe conflicts, dangers and so on.

But this last point raises a fresh problem. Instead of the affect of anxiety let us take, for a moment, another affect – that of pain, for instance. It seems quite normal that at four years of age a girl should weep painfully if her doll is broken; or at six, if her governess reproves her; or at sixteen, if she is slighted by her young man; or at twenty-five, perhaps, if a child of her own dies. Each of these determinants of pain

has its own time and each passes away when that time is over. Only the final and definitive determinants remain throughout life. We should think it strange if this same girl, after she had grown to be a wife and mother, were to cry over some worthless trinket that had been damaged. Yet that is how the neurotic behaves. Although all the agencies for mastering stimuli have long ago been developed within wide limits in his mental apparatus, and although he is sufficiently grown up to satisfy most of his needs for himself and has long ago learnt that castration is no longer practised as a punishment, he nevertheless behaves as though the old danger situations still existed, and keeps hold of all the earlier determinants of anxiety.

Why this should be so calls for a rather long reply. First of all, we must sift the facts. In a great number of cases the old determinants of anxiety do really lapse, after having produced neurotic reactions. The phobias of very young children, fears of being alone or in the dark or with strangers – phobias which can almost be called normal – usually pass off later on; the child 'grows out of them', as we say about some other disturbances of childhood. Animal phobias, which are of such frequent occurrence, undergo the same fate and many conversion hysterias of early years find no continuation in later life. Ceremonial actions appear extremely often in the latency period, but only a very small percentage of them develop later into a full obsessional neurosis. In general, so far as we can tell from our observations of town children belonging to the white races and living according to fairly high cultural [148]
standards [*Kulturanforderungen*], the neuroses of childhood are in the nature of regular episodes in a child's development, although too little attention is still being paid to them. Signs of childhood neuroses can be detected in *all* adult neurotics without exception; but by no means all children who show those signs become neurotic in later life. It must be, therefore, that certain determinants of anxiety are relinquished and certain danger situations lose their significance as the individual becomes more mature. Moreover, some of these danger situations manage to survive into later times by modifying their determinants of anxiety so as to bring them up to date. Thus, for instance, a man may retain his fear of castration in the guise of a syphilidophobia, after he has come to know that it is no longer customary to castrate people for indulging their sexual lusts, but that, on the other hand, severe diseases may overtake anyone who thus gives way to his drives. Other determinants of anxiety, such as fear of the superego, are destined not to disappear at all but to accompany people throughout their lives. In that case the

neurotic will differ from the normal person in that his reactions to the dangers in question will be unduly strong. Finally, being grown up affords no absolute protection against a return of the original traumatic anxiety situation. Each individual has in all probability a limit beyond which his mental apparatus fails [*versagt*] in its function of mastering the quantities of excitation which need to be disposed of.

These minor rectifications cannot in any way alter the fact which is here under discussion, that a great many people remain infantile in their behaviour in regard to danger and do not overcome determinants of anxiety which have grown out of date. To deny this would be to deny the existence of neurosis, for it is precisely such people whom we call neurotics. But how is this possible? Why are not all neuroses episodes in the development of the individual which come to a close when the next phase is reached? Whence comes the element of persistence in these reactions to danger? Why does the affect of anxiety alone seem to enjoy the advantage over all other affects of evoking reactions which are distinguished from the rest in being abnormal and which, through their inexpediency, run counter to the movement of life? In other
[149] words, we have once more come unawares upon the riddle which has so often confronted us: whence does neurosis come – what is its ultimate, its own peculiar raison d'être [*Motiv*]? After tens of years of psychoanalytic labours, we are as much in the dark about this problem as we were at the start.

X

Anxiety is the reaction to danger. One cannot, after all, help suspecting [150]
that the reason why the affect of anxiety occupies a unique position in the economy of the mind has something to do with the essential nature of danger. Yet dangers are the common lot of humanity; they are the same for everyone. What we need and cannot lay our finger on is some factor which will explain why some people are able to subject the affect of anxiety, in spite of its peculiar quality, to the normal workings of the mind, or which decides who is doomed to come to grief over that task. Two attempts to find a factor of this kind have been made; and it is natural that such efforts should meet with a sympathetic reception, since they promise help to meet a tormenting need. The two attempts in question are mutually complementary; they approach the problem at opposite ends. The first was made by Alfred Adler more than ten years ago.[1] His contention, reduced to its essence, was that the people who came to grief over the task set them by danger were those who were too greatly impeded by some organic inferiority. If it were true that *simplex sigillum veri*,[2] we should welcome such a solution [*Lösung*] as a deliverance [*Erlösung*]. But on the contrary, our critical studies of the last ten years have effectively demonstrated the total inadequacy of such an explanation – an explanation, moreover, which sets aside the whole wealth of material that has been discovered by psychoanalysis.

The second attempt was made by Otto Rank in 1923 in his book *The Trauma of Birth*. [See pp. 75 and 120 f. above.] It would be unjust to put his attempt on the same level as Adler's except in this single point which concerns us here, for it remains on psychoanalytic ground and pursues a psychoanalytic line of thought, so that it may be accepted as a legitimate endeavour to solve the problems of analysis. In this matter of the relation of the individual to danger Rank moves away from the question of organic defect in the individual and concentrates on the variable degree of intensity of the danger. The process of birth is the first situ- [151]
ation of danger, and the economic upheaval which it produces becomes the prototype of the reaction of anxiety. We have already [p. 120 ff.] traced the line of development which connects this first danger situation and determinant of anxiety with all the later ones, and we have seen

1 [See, for instance, Adler, 1907.]

2 [I.e. simplicity is the seal of truth.]

that they all retain a common quality insofar as they signify in a certain sense a separation from the mother – at first only in a biological sense, next as a direct loss of object and later as a loss of object incurred indirectly. The discovery of this extensive concatenation is an undoubted merit of Rank's construction. Now the trauma of birth overtakes each individual with a different degree of intensity, and the violence of his anxiety reaction varies with the strength of the trauma; and it is the initial amount of anxiety generated in him which, according to Rank, decides whether he will ever learn to control it – whether he will become neurotic or normal.

It is not our business to criticize Rank's hypothesis in detail here. We have only to consider whether it helps to solve our particular problem. His formula – that those people become neurotic in whom the trauma of birth was so strong that they have never been able completely to abreact it – is highly disputable from a theoretical point of view. We do not rightly know what is meant by abreacting the trauma. Taken literally, it implies that the more frequently and the more intensely a neurotic person reproduces the affect of anxiety the more closely will he approach to mental health – an untenable conclusion. It was because it did not tally with the facts that I gave up the theory of abreaction which had played such a large part in the cathartic method. To lay so much stress, too, on the variability in the strength of the birth trauma is to leave no room for the legitimate claims of hereditary constitution as an aetiological factor. For this variability is an organic factor which operates in an accidental fashion in relation to the constitution and is itself dependent on many influences which might be called accidental – as, for instance, on timely assistance in childbirth. Rank's theory completely ignores constitutional factors as well as phylogenetic ones. If, however, we were to try to find a place for the constitutional factor by qualifying his statement with the proviso, let us say, that what is really important is the extent to which the individual reacts to the variable [152] intensity of the trauma of birth, we should be depriving his theory of its significance and should be relegating the new factor introduced by him to a position of minor importance: the factor which decided whether or not a neurosis should supervene would lie in a different, and once more in an unknown, field.

Moreover, the fact that while man shares the process of birth with the other mammals he alone has the privilege over them of possessing a special disposition to neurosis is hardly favourable to Rank's theory. But the main objection to it is that it floats in the air instead of being

based upon ascertained observations. No body of evidence has been collected to show that difficult and protracted birth does in fact coincide with the development of a neurosis, or even that children so born exhibit the phenomena of early infantile apprehensiveness [*Ängstlichkeit*] more strongly and over a longer period than other children. It might be rejoined that induced labour and births that are easy for the mother may possibly involve a severe trauma for the child. But we can still point out that births which lead to asphyxia would be bound to give clear evidence of the results which are supposed to follow. It should be one of the advantages of Rank's aetiological theory that it postulates a factor whose existence can be verified by observation. And so long as no such attempt at verification has been made it is impossible to assess the theory's value.

On the other hand, I cannot identify myself with the view that Rank's theory contradicts the aetiological importance of the sexual drives as hitherto recognized by psychoanalysis. For his theory has reference only to the individual's relation to the danger situation, so that it leaves it perfectly open to us to assume that if a person has not been able to master his first dangers he is bound to come to grief as well in later situations involving sexual danger and thus be driven into a neurosis.

I do not believe, therefore, that Rank's attempt has solved the problem of the causation of neurosis; nor do I believe that we can say as yet how much it may nevertheless have *contributed* to such a solution. If an investigation into the effects of difficult birth on the disposition to neurosis should yield negative results, we shall rate the value of his contribution low. It is to be feared that our need to find a single, tangible 'ultimate cause' of neurotic illness will remain unsatisfied. The ideal [153]
solution, which medical men no doubt still yearn for, would be to discover some bacillus which could be isolated and bred in a pure culture and which, when injected into anyone, would invariably produce the same illness; or, to put it rather less extravagantly, to demonstrate the existence of certain chemical substances the administration of which would bring about or cure particular neuroses. But the probability of a solution of this kind seems slight.

Psychoanalysis leads to less simple and satisfactory conclusions. What I have to say in this connection has long been familiar and I have nothing new to add. If the ego succeeds in protecting itself from a dangerous drive impulse, through, for instance, the process of repression, it has certainly inhibited and damaged the particular part of the id concerned; but it has at the same time given it some independence and has

renounced some of its own sovereignty. This is inevitable from the nature of repression, which is, fundamentally, an attempt at flight. The repressed is now, as it were, an outlaw; it is excluded from the great organization of the ego and is subject only to the laws which govern the realm of the unconscious. If, now, the danger situation changes so that the ego has no reason for fending off [*Motiv zur Abwehr*] a new drive impulse analogous to the repressed one, the consequence of the restriction of the ego which has taken place will become manifest. The new impulse will run its course under an automatic influence – or, as I should prefer to say, under the influence of the compulsion to repeat [*Wiederholungszwanges*]. It will follow the same path as the earlier, repressed impulse, as though the danger situation that had been overcome still existed. The fixating factor in repression, then, is the unconscious id's compulsion to repeat – a compulsion which in normal circumstances is only done away with by the freely mobile function of the ego. The ego may occasionally manage to break down the barriers of repression which it has itself put up and to recover its influence over the drive impulse and direct the course of the new impulse in accordance with the changed danger situation. But in point of fact the ego very seldom succeeds in doing this: it cannot undo its repressions. It is possible that the way the struggle will go depends upon quantitative
[154] relations. In some cases one has the impression that the outcome is an enforced one: the regressive attraction exerted by the repressed impulse and the strength of the repression are so great that the new impulse has no choice but to obey the compulsion to repeat. In other cases we perceive a contribution from another play of forces: the attraction exerted by the repressed prototype is reinforced by a repulsion coming from the direction of difficulties in real life which stand in the way of any different course that might be taken by the new drive impulse.

That this is a correct account of fixation upon repression and of the retention of danger situations that are no longer present-day ones is confirmed by the fact of analytic therapy – a fact which is modest enough in itself but which can hardly be overrated from a theoretical point of view. When, in analysis, we have given the ego assistance which is able to put it in a position to lift its repressions, it recovers its power over the repressed id and can allow the drive impulses to run their course as though the old situations of danger no longer existed. What we can do in this way tallies with what can be achieved in other fields of medicine; for as a rule our therapy must be content with bringing about more quickly, more reliably and with less expenditure of energy

than would otherwise be the case the good result which in favourable circumstances would have occurred of itself.

We see from what has been said that *quantitative* relations – relations which are not directly observable but which can only be inferred – are what determine whether or not old situations of danger shall be preserved, repressions on the part of the ego maintained and childhood neuroses find a continuation. Among the factors that play a part in the causation of neuroses and that have created the conditions under which the forces of the mind are pitted against one another, three emerge into prominence: a biological, a phylogenetic and a purely psychological factor.

The biological factor is the long period of time during which the young of the human species is in a condition of helplessness and dependence. Its intrauterine existence seems to be short in comparison with that of most animals, and it is sent into the world in a less finished state. As a result, the influence of the real external world upon it is intensified and an early differentiation between the ego and the id is promoted. [155] Moreover, the dangers of the external world have a greater importance for it, so that the value of the object which can alone protect it against them and take the place of its former intrauterine life is enormously enhanced. The biological factor, then, establishes the earliest situations of danger and creates the need to be loved which will accompany the child through the rest of its life.

The existence of the second, phylogenetic, factor is based only upon inference. We have been led to assume its existence by a remarkable feature in the development of the libido. We have found that the sexual life of man, unlike that of most of the animals nearly related to him, does not make a steady advance from birth to maturity, but that, after an early efflorescence up till the fifth year, it undergoes a very decided interruption; and that it then starts on its course once more at puberty, taking up again the beginnings broken off in early childhood. This has led us to suppose that something momentous must have occurred in the vicissitudes of the human species[1] which has left behind this interruption in the sexual development of the individual as a historical precipitate. This factor owes its pathogenic significance to the fact that the majority of the drive demands of this infantile sexuality are treated by the ego as dangers and fended off as such, so that the later sexual

1 [In Chapter III of *The Ego and the Id* (1923*b*), Freud makes it clear that he has the geological glacial epoch in mind. Cf. *RSE*, **19**, 30. The idea had been put forward earlier by Ferenczi (1913*c*), and elaborated in Freud's (1985*a* [1915]) metapsychological draft 'Overview of the Transference Neuroses', *RSE*, **14**, 247 ff.]

impulses of puberty, which in the natural course of things would be ego-syntonic [*ichgerecht*][T], run the risk of succumbing to the attraction of their infantile prototypes and following them into repression. It is here that we come upon the most direct aetiology of the neuroses. It is a curious thing that early contact with the demands of sexuality should have a similar effect on the ego to that produced by premature contact with the external world.

The third, psychological, factor resides in a defect of our mental apparatus which has to do precisely with its differentiation into an id and an ego, and which is therefore also attributable ultimately to the influence of the external world. In view of the dangers of [external] reality,
[156] the ego is obliged to guard against certain drive impulses in the id and to treat them as dangers. But it cannot protect itself from internal drive dangers as effectively as it can from some piece of reality that is not part of itself. Intimately bound up with the id as it is, it can only fend off a drive danger by restricting its own organization and by acquiescing in the formation of symptoms in exchange for having impaired the drive. If the rejected drive renews its attack, the ego is overtaken by all those difficulties which are known to us as neurotic ailments.

Further than this, I believe, our knowledge of the nature and causes of neurosis has not as yet been able to go.

XI
ADDENDA

In the course of this discussion various themes have had to be put aside before they had been fully dealt with. I have brought them together in this chapter so that they may receive the attention they deserve. [157]

A. MODIFICATIONS OF EARLIER VIEWS

(a) Resistance and Anticathexis

An important element in the theory of repression is the view that repression is not an event that occurs once but that it requires a permanent expenditure [of force]. If this expenditure were to cease, the repressed drive [*Trieb*],[1] which is being fed all the time from its sources, would on the next occasion flow along the channels from which it had been forced away, and the repression would either fail in its purpose or would have to be repeated an indefinite number of times.[2] Thus it is because drives are continuous in their nature that the ego has to make its defensive action secure by a permanent expenditure [of force]. This action undertaken to protect repression is observable in analytic treatment as *resistance*. Resistance presupposes the existence of what I have called *anticathexis* [*Gegenbesetzung*]. An anticathexis of this kind is clearly seen in obsessional neurosis. It appears there in the form of an alteration of the ego,[3] as a reaction-formation in the ego, and is effected by the reinforcement of the attitude which is the opposite of the drive trend that has to be repressed – as, for instance, in pity, conscientiousness and cleanliness. These reaction-formations of obsessional neurosis are essentially exaggerations of the normal traits of character which develop during the latency period. The presence of an anticathexis in hysteria is much more difficult to detect, though theoretically it is equally indispensable. In hysteria, too, a certain amount of alteration of the ego through reaction-formation is unmistakable and in some circumstances becomes so marked that it forces itself on our attention as the principal symptom. The conflict due to ambivalence, for instance, [158]

1 [Translated as 'impulse' in the *SE*.]

2 [Cf. the paper on 'Repression' (1915*d*), *RSE*, **14**, 133–4.]

3 [See an Editors' footnote to 'Analysis Terminable and Interminable' (1937*c*), ibid., **23**, 199 *n*. 1.]

is resolved in hysteria by this means. The subject's hatred of a person whom he loves is kept down by an exaggerated amount of tenderness for him and apprehensiveness about him. But the difference between reaction-formations in obsessional neurosis and in hysteria is that in the latter they do not have the universality of a character trait but are confined to particular relationships. A hysterical woman, for instance, may be specially affectionate with her own children whom at bottom she hates; but she will not on that account be more loving in general than other women or even more affectionate to other children. The reaction-formation of hysteria clings tenaciously to a particular object and never spreads over into a general disposition of the ego, whereas what is characteristic of obsessional neurosis is precisely a spreading over of this kind – a loosening of relations to the object and a facilitation of displacement in the choice of object.

There is another kind of anticathexis, however, which seems more suited to the peculiar character of hysteria. A repressed drive impulse can be activated (newly cathected) from two directions: from within, through reinforcement from its internal sources of excitation, and from without, through the perception of an object that it desires. The hysterical anticathexis is mainly directed outwards, against dangerous perceptions. It takes the form of a special kind of vigilance which, by means of restrictions of the ego, causes situations to be avoided that would entail such perceptions, or, if they do occur, manages to withdraw the subject's attention from them. Some French analysts, in particular Laforgue [1926], have recently given this action of hysteria the special name of 'scotomization'.[1] This technique of anticathexis is more noticeable still in the phobias, whose interest is concentrated on removing the subject ever further from the possibility of the occurrence of the feared perception. The fact that anticathexis has an opposite
[159] direction in hysteria and the phobias from what it has in obsessional neurosis – though the distinction is not an absolute one – seems to be significant. It suggests that there is an intimate connection between repression and external anticathexis on the one hand and between regression and internal anticathexis (i.e. alteration of the ego through reaction-formation) on the other. The task of defence against a dangerous perception is, incidentally, common to all neuroses. Various commands and prohibitions in obsessional neurosis have the same end in view.

1 [Freud discussed this term at some length in his later paper on 'Fetishism' (1927*e*) in connection with the concept of disavowal (*Verleugnung*), *RSE*, **21**, 138–41.]

We showed on an earlier occasion[1] that the resistance that has to be overcome in analysis proceeds from the ego, which clings to its anti-cathexes. It is hard for the ego to direct its attention to perceptions and ideas [*Vorstellungen*] which it has up till now made a rule of avoiding, or to acknowledge as belonging to itself impulses that are the complete opposite of those which it knows as its own. Our fight against resistance in analysis is based upon this view of the facts. If the resistance is itself unconscious, as so often happens owing to its connection with the repressed material, we make it conscious. If it is conscious, or when it has become conscious, we bring forward logical arguments against it; we promise the ego rewards and advantages if it will give up its resistance. There can be no doubt or mistake about the existence of this resistance on the part of the ego. But we have to ask ourselves whether it covers the whole state of affairs in analysis. For we find that even after the ego has decided to relinquish its resistances it still has difficulty in undoing the repressions; and we have called the period of strenuous effort which follows after its praiseworthy decision the phase of 'working through'.[2] The dynamic factor which makes a working through of this kind necessary and comprehensible is not far to seek. It must be that after the ego's resistance has been removed the power of the compulsion to repeat – the attraction exerted by the unconscious prototype upon the repressed drive process – has still to be overcome. There is nothing to be said against describing this factor as the *resistance of the unconscious*. There is no need to be discouraged by these emendations. They are to be welcomed if they add something to our knowledge, and they are no disgrace to us so long as they enrich rather than invalidate our earlier views – by limiting some statement, perhaps, that was too general or by enlarging some idea that was too narrowly formulated. [160]

It must not be supposed that these emendations provide us with a complete survey of all the kinds of resistance that are met with in analysis. Further investigation of the subject shows that the analyst has to combat no less than five kinds of resistance, emanating from three directions – the ego, the id and the superego. The ego is the source of three of these, each differing in its dynamic nature. The first of these three ego resistances is the *repression* resistance, which we have already discussed above [p. 139 f.] and about which there is least new to be added. Next there is the *transference* resistance, which is of the same

1 [In Chapter I of *The Ego and the Id* (1923*b*), *RSE*, **19**, 14.]

2 [See 'Remembering, Repeating and Working Through' (1914*g*), ibid., **12**, 152–3. Freud returned to the subject in Section VI of his late technical paper 'Analysis Terminable and Interminable' (1937*c*), ibid., **23**, 217 ff.]

nature but which has different and much clearer effects in analysis, since it succeeds in establishing a relation to the analytic situation or the analyst himself and thus reanimating a repression which should only have been recollected.[1] The third resistance, though also an ego resistance, is of quite a different nature. It proceeds from the *gain from illness* and is based upon an assimilation of the symptom into the ego. [See above, p. 87 f.] It represents an unwillingness to renounce any satisfaction or relief that has been obtained. The fourth variety, arising from the *id*, is the resistance which, as we have just seen, necessitates 'working through'. The fifth, coming from the *superego* and the last to be discovered, is also the most obscure though not always the least powerful one. It seems to originate from the sense of guilt or the need for punishment; and it opposes every move towards success, including, therefore, the patient's own recovery through analysis.[2]

(b) Anxiety from Transformation of Libido

[161] The view of anxiety which I have put forward in these pages diverges somewhat from the one I have hitherto thought correct. Formerly I regarded anxiety as a general reaction of the ego under conditions of unpleasure. I always sought to justify its appearance on economic grounds[3] and I assumed, on the strength of my investigations into the 'actual' neuroses, that libido (sexual excitation) which was rejected or not utilized by the ego found direct discharge in the form of anxiety. It cannot be denied that these various assertions did not go very well together, or at any rate did not necessarily follow from one another. Moreover, they gave the impression of there being a specially intimate connection between anxiety and libido and this did not accord with the general character of anxiety as a reaction to unpleasure.

The objection to this view arose from our coming to regard the ego as the sole seat of anxiety. It was one of the results of the attempt at a structural division [*Gliederung*] of the mental apparatus which I made in *The Ego and the Id*. Whereas the old view made it natural to suppose that anxiety arose from the libido belonging to the repressed drive impulses, the new one, on the contrary, made the ego the source of anxiety. Thus it is a question of drive (id) anxiety or ego anxiety. Since

1 [Cf. 'Remembering, Repeating and Working Through' (1914g), *RSE*, **12**, 148 ff.]

2 [This was discussed in the earlier part of Chapter V of *The Ego and the Id* (1923*b*), ibid., **19**, 44 f.]

3 ['*ökonomisch*.' This word appears only in the first (1926) German edition. It was omitted, no doubt by accident, in all the later ones.]

the energy which the ego employs is desexualized, the new view also tended to weaken the close connection between anxiety and libido. I hope I have at least succeeded in making the contradiction plain and in giving a clear idea of the point in doubt.

Rank's contention – which was originally my own[1] – that the affect of anxiety is a consequence of the event of birth and a repetition of the situation then experienced, obliged me to review the problem of anxiety once more. But I could make no headway with his idea that birth is a trauma, states of anxiety a reaction of discharge to it and all subsequent affects of anxiety an attempt to 'abreact' it more and more completely. I was obliged to go back from the anxiety reaction to the *situation of danger* that lay behind it. The introduction of this element opened up new aspects of the question. Birth was seen to be the prototype of all later situations of danger which overtook the individual under the new [162] conditions arising from a changed mode of life and a growing mental development. On the other hand, its own significance was reduced to this prototypic relationship to danger. The anxiety felt at birth became the prototype of an affective state which had to undergo the same vicissitudes as the other affects. Either the state of anxiety reproduced itself *automatically* in situations analogous to the original situation and was thus an inexpedient form of reaction instead of an expedient one as it had been in the first situation of danger; or the ego acquired power over this affect, reproduced it on its own initiative, and employed it as a warning of danger and as a means of setting the pleasure–unpleasure mechanism in motion. We thus gave the biological aspect of the anxiety affect its due importance by recognizing anxiety as the general reaction to situations of danger; while we endorsed the part played by the ego as the seat of anxiety by allocating to it the function of producing the anxiety affect according to its needs. Thus we attributed two modes of origin to anxiety in later life. One was involuntary, automatic and always justified on economic grounds, and arose whenever a danger situation analogous to birth had established itself. The other was produced by the ego as soon as a situation of this kind merely threatened to occur, in order to call for its avoidance. In the second case, the ego subjects itself to anxiety as a sort of inoculation, submitting to a slight attack of the illness in order to escape its full strength. It vividly imagines the danger situation, as it were, with the unmistakable purpose of restricting that distressing experience to a mere indication, a signal. We have already seen in detail [pp. 121–4 above] how the various situations of danger

1 [See Editors' Introduction, p. 74 f. above.]

arise one after the other, retaining at the same time a genetic connection.

We shall perhaps be able to proceed a little further in our understanding of anxiety when we turn to the problem of the relation between neurotic anxiety and realistic anxiety [p. 146 ff. below].

Our former hypothesis of a direct transformation of libido into anxiety possesses less interest for us now than it did. But if we do nevertheless consider it, we shall have to distinguish different cases. As regards anxiety evoked by the ego as a signal, it does not come into consideration; nor does it, therefore, in any of those danger situations
[163] which move the ego to bring on repression. The libidinal cathexis of the repressed drive impulse is employed otherwise than in being transformed into anxiety and discharged as such – as is most clearly seen in conversion hysteria. On the other hand, further enquiry into the question of the danger situation will bring to our notice an instance of the production of anxiety which will, I think, have to be accounted for in a different way [pp. 148–9].

(c) Repression and Defence

In the course of discussing the problem of anxiety I have revived a concept or, to put it more modestly, a term, of which I made exclusive use thirty years ago when I first began to study the subject but which I later abandoned. I refer to the term 'defensive process'.[1] I afterwards replaced it with the word 'repression', but the relation between the two remained uncertain. It will be an undoubted advantage, I think, to revert to the old concept of 'defence', provided we employ it explicitly as a general designation for all the techniques which the ego makes use of in conflicts which may lead to a neurosis, while we retain the word 'repression' for the special method of defence which the line of approach taken by our investigations made us better acquainted with in the first instance.

Even a purely terminological innovation ought to justify its adoption; it ought to reflect some new point of view or some extension of knowledge. The revival of the concept of defence and the restriction of that of repression takes into account a fact which has long since been known but which has received added importance owing to some new discoveries. Our first observations of repression and of the formation of symptoms were made in connection with hysteria. We found that the perceptual content of exciting experiences and the

1 Cf. 'The Neuropsychoses of Defence' (1894*a*), *RSE*, **3**, 45. [See Appendix A, p. 153 f. below.]

ideational content of pathogenic structures of thought were forgotten and debarred from being reproduced in memory, and we therefore concluded that the keeping away from consciousness was a main characteristic of hysterical repression. Later on, when we came to study the obsessional neuroses, we found that in that illness pathogenic occurrences are not forgotten. They remain conscious but they are 'isolated' in some way that we cannot as yet grasp, so that much the [164]
same result is obtained as in hysterical amnesia. Nevertheless the difference is great enough to justify the belief that the process by which drive demands are set aside in obsessional neurosis cannot be the same as in hysteria. Further investigations have shown that in obsessional neurosis a regression of the drive impulses to an earlier libidinal stage is brought about through the opposition of the ego, and that this regression, although it does not make repression unnecessary, clearly works in the same sense as repression. We have seen, too, that in obsessional neurosis anticathexis, which is also presumably present in hysteria, plays a specially large part in protecting the ego by effecting a reactive alteration of it. Our attention has, moreover, been drawn to a process of 'isolation' (whose technique cannot as yet be elucidated) which finds direct symptomatic manifestation, and to a procedure, that may be called magical, of 'undoing' [*Ungeschehenmachens*] what has been done – a procedure about whose defensive purpose there can be no doubt, but which has no longer any resemblance to the process of 'repression'. These observations provide good enough grounds for reintroducing the old concept of *defence*, which can cover all these processes that have the same purpose – namely, the protection of the ego against drive demands – and for subsuming repression under it as a special case. The importance of this nomenclature is heightened if we consider the possibility that further investigations may show that there is an intimate connection between special forms of defence and particular illnesses, as, for instance, between repression and hysteria. In addition, we may look forward to the possible discovery of yet another important correlation. It may well be that before its sharp cleavage into an ego and an id, and before the formation of a superego, the mental apparatus makes use of different methods of defence from those which it employs after it has reached these stages of organization.

B. SUPPLEMENTARY REMARKS ON ANXIETY

The affect of anxiety exhibits one or two features the study of which
[165] promises to throw further light on the subject. Anxiety has an unmistakable relation to *expectation*: it is anxiety *about*[1] something. It has a quality of *indefiniteness and lack of object*. In precise speech we use the word 'fear' [*Furcht*] rather than 'anxiety' [*Angst*] if it has found an object. Moreover, in addition to its relation to danger, anxiety has a relation to neurosis which we have long been trying to elucidate. The question arises: why are not all reactions of anxiety neurotic – why do we accept so many of them as normal? And finally the problem of the difference between realistic anxiety and neurotic anxiety awaits a thorough examination.

To begin with the last problem. The advance we have made is that we have gone behind reactions of anxiety to situations of danger. If we do the same thing with realistic anxiety we shall have no difficulty in solving the question. Real danger is a danger that is known, and realistic anxiety is anxiety about a known danger of this sort. Neurotic anxiety is anxiety about an unknown danger. Neurotic danger is thus a danger that has still to be discovered. Analysis has shown that it is a drive danger. By bringing this danger which is not known to the ego into consciousness, the analyst makes neurotic anxiety no different from realistic anxiety, so that it can be dealt with in the same way.

There are two reactions to real danger. One is an affective reaction, an outbreak of anxiety. The other is a protective action. The same will presumably be true of drive danger. We know how the two reactions can cooperate in an expedient way, the one giving the signal for the other to appear. But we also know that they can behave in an inexpedient way: paralysis from anxiety may set in, and the one reaction spread at the cost of the other.

In some cases the characteristics of realistic anxiety and neurotic
[166] anxiety are mingled. The danger is known and real but the anxiety in regard to it is over-great, greater than seems proper to us. It is this surplus of anxiety which betrays the presence of a neurotic element.

1 [In German '*vor*', literally 'before'. See similar discussions at the beginning of Chapter II of *Beyond the Pleasure Principle* (1920*g*), *RSE*, **18**, 12 f., and in Lecture XXV of the *Introductory Lectures* (1916–17*a*), ibid., **16**, 346 ff. It has not been possible in translation to render the German '*Angst*' invariably by 'anxiety'. In this volume, and throughout the *RSE*, the word has sometimes been translated by 'fear' or by phrases including the word 'afraid', where English usage required it and confusion seemed unlikely. In selected places in the present work, these differences have been indicated through the use of square brackets in the text. Some further remarks on this can be found in an Editors' Appendix, ibid., **3**, 104.]

Such cases, however, introduce no new principle; for analysis shows that to the known real danger an unknown drive danger is attached.

We can find out still more about this if, not content with tracing anxiety back to danger, we go on to enquire what the essence and meaning of a danger situation is. Clearly, it consists in the subject's estimation of his own strength compared to the magnitude of the danger and in his admission of helplessness in the face of it – physical helplessness if the danger is real and psychical helplessness if it is drive-related. In doing this, he will be guided by the actual experiences he has had. (Whether or not he is wrong in his estimation is immaterial for the outcome.) Let us call a situation of helplessness of this kind that has been actually experienced a *traumatic situation*. We shall then have good grounds for distinguishing a traumatic situation from a danger situation.

The individual will have made an important advance in his capacity for self-preservation if he can foresee and expect a traumatic situation of this kind which entails helplessness, instead of simply waiting for it to happen. Let us call a situation which contains the determinant for such an expectation a danger situation. It is in this situation that the signal of anxiety is given. The signal announces: 'I am expecting a situation of helplessness to set in', or: 'The present situation reminds me of one of the traumatic experiences I have had before. Therefore I will anticipate the trauma and behave as though it had already come, while there is yet time to turn it aside.' Anxiety is therefore, on the one hand, an expectation of a trauma, and, on the other, a repetition of it in a mitigated form. Thus the two features of anxiety which we have noted have a different origin. Its connection with expectation belongs to the danger situation, whereas its indefiniteness and lack of object belong to the traumatic situation of helplessness – the situation which is anticipated in the danger situation.

Taking this sequence, anxiety–danger–helplessness (trauma), we can now summarize what has been said. A danger situation is a recognized, remembered, expected situation of helplessness. Anxiety is the original reaction to helplessness in the trauma and is reproduced later on in the [167]
danger situation as a signal for help. The ego, which experienced the trauma passively, now repeats it actively in a weakened version, in the hope of being able itself to direct its course. It is certain that children behave in this fashion towards every distressing impression they receive, by reproducing it in their play. In thus changing from passivity to activity they attempt to master their experiences psychically.[1] If this

1 [Cf. *Beyond the Pleasure Principle* (1920g), *RSE*, **18**, 15–16.]

is what is meant by 'abreacting a trauma' we can no longer have anything to urge against the phrase. [See p. 134 above.] But what is of decisive importance is the first displacement of the anxiety reaction from its origin in the situation of helplessness to an expectation of that situation – that is, to the danger situation. After that come the later displacements, from the danger to the determinant of the danger – loss of the object and the modifications of that loss with which we are already acquainted.

The undesirable result of 'spoiling' a small child is to magnify the importance of the danger of losing the object (the object being a protection against every situation of helplessness) in comparison with every other danger. It therefore encourages the individual to remain in the state of childhood, the period of life which is characterized by motor and psychical helplessness.

So far we have had no occasion to regard realistic anxiety in any different light from neurotic anxiety. We know what the distinction is. A real danger is a danger which threatens a person from an external object, and a neurotic danger is one which threatens him from a drive demand. Insofar as the drive demand is something real, his neurotic anxiety, too, can be admitted to have a realistic basis. We have seen that the reason why there seems to be a specially close connection between anxiety and neurosis is that the ego defends itself against a drive danger with the help of the anxiety reaction just as it does against an external real danger, but that this line of defensive activity eventuates in a neurosis owing to an imperfection of the mental apparatus. We have also come to the conclusion that a drive demand often becomes an (internal)
[168] danger only because its satisfaction would bring on an external danger – that is, because the internal danger represents an external one.

On the other hand, the external (real) danger must also have managed to become internalized if it is to be significant for the ego. It must have been recognized as related to some situation of helplessness that has been experienced.[1] Man seems not to have been endowed, or to have been endowed to only a very small degree, with an instinctive [*instinktive*] recognition of the dangers that threaten him from without. Small children are constantly doing things which endanger their lives, and that

1 It may quite often happen that, although a danger situation is correctly estimated in itself, a certain amount of drive anxiety is added to the realistic anxiety. In that case the drive demand before whose satisfaction the ego recoils is a masochistic one: the drive to destruction directed against the subject himself. Perhaps an addition of this kind explains cases in which reactions of anxiety are exaggerated, inexpedient or paralysing. Phobias of heights (windows, towers, precipices and so on) may have some such origin. Their hidden feminine significance is closely connected with masochism. [Cf. 'Dreams and Telepathy' (1922*a*), *RSE*, **18**, 204.]

is precisely why they cannot afford to be without a protecting object. In relation to the traumatic situation, in which the subject is helpless, external and internal dangers, real dangers and drive demands converge. Whether the ego is suffering from a pain which will not stop or experiencing an accumulation of drive needs which cannot obtain satisfaction, the economic situation is the same, and the motor helplessness of the ego finds expression in psychical helplessness.

In this connection, the puzzling phobias of early childhood deserve to be mentioned once again. [Cf. p. 120 f. above.] We have been able to explain some of them, such as the fear of being alone or in the dark or with strangers, as reactions to the danger of losing the object. Others, like the fear of small animals, thunderstorms, etc., might perhaps be accounted for as vestigial traces of the congenital preparedness to meet real dangers which is so strongly developed in other animals. In man, only that part of this archaic heritage is appropriate which has reference to the loss of the object. If childhood phobias become fixated and grow stronger and persist into later years, analysis shows that their content has become associated with drive demands and has come to stand for internal dangers as well.

C. ANXIETY, PAIN AND MOURNING

So little is known about the psychology of emotional processes that the [169]
tentative remarks I am about to make on the subject may claim a very lenient judgement. The problem before us arises out of the conclusion we have reached that anxiety comes to be a reaction to the danger of a loss of an object. Now we already know one reaction to the loss of an object, and that is mourning.[1] The question therefore is, when does that loss lead to anxiety and when to mourning? In discussing the subject of mourning on a previous occasion I found that there was one feature about it which remained quite unexplained. This was its peculiar painfulness. [Cf. p. 116 above.][2] And yet it seems self-evident that separation from an object should be painful. Thus the problem becomes more complicated: when does separation from an object produce anxiety, when does it produce mourning and when does it produce, it may be, only pain?

Let me say at once that there is no prospect in sight of answering these questions. We must content ourselves with drawing certain distinctions and adumbrating certain possibilities.

1 [See footnote 1, p. 116 above.]

2 'Mourning and Melancholia' (1916–17*g* [1915]) [*RSE*, **14**, 218–19].

Our starting point will again be the one situation which we believe we understand – the situation of the infant when it is presented with a stranger instead of its mother. It will exhibit the anxiety which we have attributed to the danger of loss of object. But its anxiety is undoubtedly more complicated than this and merits a more thorough discussion. That it does have anxiety there can be no doubt; but the expression of its face and its reaction of crying indicate that it is feeling pain as well. Certain things seem to be joined together in it which will later on be separated out. It cannot as yet distinguish between temporary absence and permanent loss. As soon as it loses sight of its mother it behaves as if it were never going to see her again; and repeated consoling experiences to the contrary are necessary before it learns that her disappearance is usually followed by her reappearance. Its mother encourages this piece of knowledge which is so vital to it by playing the
[170] familiar game of hiding her face from it with her hands and then, to its joy, uncovering it again.[1] In these circumstances it can, as it were, feel longing unaccompanied by despair.

In consequence of the infant's misunderstanding of the facts, the situation of missing its mother is not a danger situation but a traumatic one. Or, to put it more correctly, it is a traumatic situation if the infant happens at the time to be feeling a need which its mother should be the one to satisfy. It turns into a danger situation if this need is not present at the moment. Thus, the first determinant of anxiety, which the ego itself introduces, is loss of perception of the object (which is equated with loss of the object itself). There is as yet no question of loss of love. Later on, experience teaches the child that the object can be present but angry with it; and then loss of love from the object becomes a new and much more enduring danger and determinant of anxiety.

The traumatic situation of missing the mother differs in one important respect from the traumatic situation of birth. At birth no object existed and so no object could be missed. Anxiety was the only reaction that occurred. Since then repeated situations of satisfaction have created an object out of the mother; and this object, whenever the infant feels a need, receives an intense cathexis which might be described as a 'longing' one. It is to this new aspect of things that the reaction of pain is referable. Pain is thus the actual reaction to loss of object, while anxiety is the reaction to the danger which that loss entails and, by a further displacement, a reaction to the danger of the loss of object itself.

1 [Cf. the child's game described in Chapter II of *Beyond the Pleasure Principle* (1920g), *RSE*, **18**, 14–16.]

We know very little about pain either. The only fact we are certain of is that pain occurs in the first instance and as a regular thing whenever a stimulus which impinges on the periphery breaks through the devices of the protective shield against stimuli and proceeds to act like a continuous drive stimulus, against which muscular action, which is as a rule effective because it withdraws the place that is being stimulated from the stimulus, is powerless.[1] If the pain proceeds not from a part of the [171]
skin but from an internal organ, the situation is still the same. All that has happened is that a portion of the inner periphery has taken the place of the outer periphery. The child obviously has occasion to undergo experiences of pain of this sort, which are independent of its experiences of need. This determinant of the generating of pain seems, however, to have very little similarity to the loss of an object. And besides, the element which is essential to pain, peripheral stimulation, is entirely absent in the child's situation of longing. Yet it cannot be for nothing that the common usage of speech should have created the notion of internal, mental pain and have treated the feeling of loss of object as equivalent to physical pain.

When there is physical pain, a high degree of what may be termed narcissistic cathexis of the painful place occurs.[2] This cathexis continues to increase and tends, as it were, to empty the ego.[3] It is well known that when internal organs are giving us pain we receive spatial and other presentations [*Vorstellungen*] of parts of the body which are ordinarily not represented at all in conscious ideation [*Vorstellen*]. Again, the remarkable fact that, when there is a psychical diversion brought about by some other interest, even the most intense physical pains fail to arise (I must not say 'remain unconscious' in this case) can be accounted for by there being a concentration of cathexis on the psychical representative of the part of the body which is giving pain. I think it is here that we shall find the point of analogy which has made it possible to carry sensations of pain over [*Übertragung*] to the mental sphere. For the intense cathexis of longing which is concentrated on the missed or lost object (a cathexis which steadily mounts up because it cannot be appeased) creates the same economic conditions as are created by the cathexis of pain which is concentrated on the injured part of the body.

1 [See *Beyond the Pleasure Principle* (1920*g*), *RSE*, **18**, 29–31, and the 'Project' (Freud, 1950*a*), Part I, Section 6.]

2 [Cf. 'On Narcissism' (1914*c*), ibid., **14**, 71.]

3 [See *Beyond the Pleasure Principle*, ibid., **18**, and an obscure passage in Section VI of Draft G (on melancholia) in the Fliess correspondence, probably dating from the beginning of January, 1895 (Freud, 1950*a*), ibid., **1**, 232–4.]

Thus the fact of the peripheral causation of physical pain can be left out of account. The transition from physical pain to mental pain corresponds to a change from narcissistic cathexis to object cathexis. An object presentation [*Objektvorstellung*] which is highly cathected by
[172] drive need plays the same role as a part of the body which is cathected by an increase of stimulus. The continuous nature of the cathectic process and the impossibility of inhibiting it produce the same state of mental helplessness. If the feeling of unpleasure which then arises has the specific character of pain (a character which cannot be more exactly described) instead of manifesting itself in the reactive form of anxiety, we may plausibly attribute this to a factor which we have not sufficiently made use of in our explanations – the high level of cathexis and 'binding' that prevails while these processes which lead to a feeling of unpleasure take place.[1]

We know of yet another emotional reaction to the loss of an object, and that is mourning. But we have no longer any difficulty in accounting for it. Mourning occurs under the influence of reality-testing; for the latter function demands categorically from the bereaved person that he should separate himself from the object, since it no longer exists.[2] Mourning is entrusted with the task of carrying out this retreat from the object in all those situations in which it was the recipient of a high degree of cathexis. That this separation should be painful fits in with what we have just said, in view of the high and unsatisfiable cathexis of longing which is concentrated on the object by the bereaved person during the reproduction of the situations in which he must undo the ties that bind him to it.

2 ['Mourning and Melancholia' (1916–17*g* [1915]), *RSE*, **14**, 218–19.]

APPENDIX A

'REPRESSION' AND 'DEFENCE'

The account which Freud gives on p. 144 above of the history of his use of the two terms is perhaps a little misleading, and in any case deserves amplification. Both of them occurred very freely during the Breuer period. The first appearance of 'repression (*Verdrängung*)' was in the 'Preliminary Communication' (1893*a*), *RSE*, **2**, 9, and of 'defence (*Abwehr*)'[1] in the first paper on 'The Neuropsychoses of Defence' (1894*a*). In the *Studies on Hysteria* (1895*d*), 'repression' appeared about a dozen times and 'defence' somewhat more often than that. There seems to have been some discrimination, however, between the use of the terms: 'repression' seems to have described the actual process, and 'defence' the motive for it. Nevertheless, in the Preface to the first edition of the *Studies* (ibid., **2**, xxvii) the authors appear to have equated the two concepts, for they spoke of their view that 'sexuality seems to play a principal part . . . as a motive for "defence" – that is, for repressing ideas from consciousness'. And, even more explicitly, Freud, in the first paragraph of his second paper on 'The Neuropsychoses of Defence' (1896*b*), ibid., **3**, 173, alluded to the 'psychical process of "defence" or "repression"'. [173]

After the Breuer period – that is, from about 1897 onwards – there was a falling off in the frequency of the use of 'defence'. It was not dropped entirely, however, and can be found several times, for instance, in Chapter VII of the first edition of *The Psychopathology of Everyday Life* (1901*b*) and in Section 7 of Chapter VII of the book on *Jokes* (1905*c*). But 'repression' was already beginning to predominate, and was almost exclusively used in the 'Dora' case history (1905*e*) and the *Three Essays* (1905*d*). And soon after this, attention was explicitly drawn to the change, in a paper on sexuality in the neuroses (1906*a*), dated June, 1905. In the course of a survey of the historical development of his views, and in dealing with the immediate post-Breuer period, Freud had occasion to mention the concept and wrote: '. . . "repression" (as I now began to say instead of "defence") . . .' (ibid., **7**, 286). [174]

The slight inaccuracy which had begun to appear in this sentence became more marked in a parallel phrase in the 'History of the Psychoanalytic Movement' (1914*d*), ibid., **14**, 8–9. Here Freud, once more writing of the end of the Breuer period, remarked: 'I looked upon psychical splitting itself as an effect of a process of repelling which at that time I called "defence", and later, "repression".'

After 1905 the predominance of 'repression' increased still more, till, for instance, in the 'Rat Man' analysis (1909*d*), we find (ibid., **10**, 150) Freud speaking of 'two kinds of repression', used respectively in hysteria and obsessional neurosis. This is

1 The corresponding verbal form used in the present edition is 'to fend off'.

a specially plain example where, on the revised scheme suggested in the present work, he would have spoken of 'two kinds of *defence*'.

But it was not long before the usefulness of 'defence' as a more inclusive term than 'repression' began unobtrusively to make its appearance – particularly in the metapsychological papers. Thus, the 'vicissitudes' of the drives, only one of which is 'repression', were regarded as 'modes of *defence*' against them (1915*c*; *RSE*, **14**, 111, 116 and 130), and, again, 'projection' was spoken of as a 'mechanism' or 'means of defence' (ibid., 163 and 198). Not until ten years later, however, in the present work, was the expediency of distinguishing between the use of the two terms explicitly recognized.

APPENDIX B

LIST OF WRITINGS BY FREUD DEALING MAINLY OR LARGELY WITH ANXIETY

The topic of anxiety occurs in a very large number (perhaps in the majority) of Freud's writings. The following list may nevertheless be of some practical use. The date at the beginning of each entry is that of the year during which the work in question was probably written. The date at the end is that of publication, and under that date fuller particulars of the work can be found in the Bibliography. The items in square brackets were published posthumously. [175]

[1893 Draft B. 'The Aetiology of the Neuroses', Section II. (1950*a*)]
[1894 Draft E. 'How Anxiety Originates.' (1950*a*)]
[1894 Draft F. 'Collection III', No. 1. (1950*a*)]
1894 'Obsessions and Phobias', Section II. (1895*c*)
1894 'On the Grounds for Detaching a Particular Syndrome from Neurasthenia under the Description "Anxiety Neurosis".' (1895*b*)
[1895 (?) Draft J. (1950*a*)]
1895 'A Reply to Criticisms of my Paper on Anxiety Neurosis.' (1895*f*)
1909 'Analysis of a Phobia in a Five-Year-Old Boy.' (1909*b*)
1910 '"Wild" Psychoanalysis.' (1910*k*)
1914 'From the History of an Infantile Neurosis.' (1918*b*)
1917 *Introductory Lectures on Psychoanalysis*, Lecture XXV. (1916–17*a*)
1925 *Inhibitions, Symptoms and Anxiety*. (1926*d*)
1932 *New Introductory Lectures on Psychoanalysis*, Lecture XXXII (First Part). (1933*a*)

An extract from the original German, under the title 'Psychoanalyse und Kurpfuscherei' ('Psychoanalysis and Quackery'), was included in *Almanach 1927*, 47–59, published in September, 1926, at about the same time as the volume itself. The present translation is a revised and corrected reprint of the *SE* version. It also includes additional (unpublished) material discovered by Ilse Grubrich-Simitis (1993) – a new Postscript with addenda, and an Appendix – translated by Mark Solms.

[180]

In the late spring of 1926 proceedings were begun in Vienna against Theodor Reik, a prominent non-medical member of the Vienna Psychoanalytical Society. He was charged, on information laid by someone whom he had been treating analytically, with a breach of an old Austrian law against quackery – a law which made it illegal for a person without a medical degree to treat patients. Freud intervened immediately and energetically as he had in fact already been engaged in defending the position of Reik and of lay analysis since the autumn of 1924. In an unpublished letter to Abraham of November 11, 1924, he wrote: 'The physiologist Durig, who is a Senior Member of the Board of Health, and as such highly official, requested an opinion on lay analysis from me. I gave him it in writing and then discussed it with him and this led to a far-reaching agreement between us.' Despite this agreement, however, it appears that Reik was officially prohibited from practising psychoanalysis by the Vienna Municipal Council on February 24, 1925. (See a letter of objection from Freud to Julius Tandler of March 8, 1925; Freud, 1960*a*.) It seems likely that Obersanitätsrat Durig was the model for the 'impartial person' to whom Freud addressed himself in the present work (see pp. 224 and 238 below).

He began writing it at the end of June, 1926; it was in print before the end of July, and was published in September. Partly, perhaps, as a result of his intervention, but partly because the evidence was unsatisfactory, the Public Prosecutor stopped the proceedings after a preliminary investigation.

The matter, however, did not rest there. The publication of Freud's booklet brought into the foreground the strong differences of opinion on the permissibility of non-medical psychoanalysis which existed within the psychoanalytical societies themselves. It was therefore considered advisable to ventilate the question, and a long series of reasoned statements (twenty-eight in all) by analysts from various countries were published in 1927 in the two official periodicals – in German in the *Internationale Zeitschrift* (Parts 1, 2 and 3 of Volume 13) and in English in the *International Journal* (Parts 2 and 3 of Volume 8). The series was brought to an end by Freud himself in a Postscript (printed below on p. 224 ff.) in which he replied to the arguments of his opponents and restated his own case.

A very full account of Freud's views on the subject can be found in Chapter IX ('Lay Analysis') of the third volume of Ernest Jones's Freud biography (1957, 309 ff., which, however, contains an interesting paramnesia; see Appendix A below). From early times he held strongly to the opinion that psychoanalysis was not to be regarded as purely a concern of the medical profession. His first published expression on the subject seems to have been in his Introduction contributed in 1913 to a

book by Pfister (Freud, 1913*b*; *RSE*, **12**, 328 f.); and in a letter (quoted by Jones, 1957, 323), written at the very end of his life in 1938, he declared that 'I have never repudiated these views and I insist on them even more intensely than before'. But it was in the work that follows that he argued the matter most closely and fully. [181]

Apart, however, from the discussion of the question of lay analysis Freud presented in the following pages what was perhaps his most successful non-technical account of the theory and practice of psychoanalysis, written in his liveliest and lightest style. The theoretical part in particular has the advantage over his earlier expository works of having been composed after the great clarification of his views on the structure of the mind in *The Ego and the Id* (1923*b*), *RSE*, **19**.[1]

1 A letter from Freud to the *Neue Freie Presse* of July 18, 1926, on the same subject as this work can be found on pp. 241–2 below.

THE QUESTION OF LAY ANALYSIS

Conversations with an Impartial Person

INTRODUCTION

The title of this small work is not immediately intelligible. I will therefore explain it. 'Layman' = 'non-doctor'; and the question is whether non-doctors as well as doctors are to be allowed to practise analysis. This question has its limitations both in time and place. In *time*, because up to now no-one has been concerned as to *who* practises analysis. Indeed, people have been much too little concerned about it – the one thing they were agreed on was a wish that *no-one* should practise it. Various reasons were given for this, but they were based on the same underlying distaste. Thus the demand that only doctors should analyse corresponds to a new and apparently more friendly attitude to analysis – if, that is, it can escape the suspicion of being after all only a slightly modified derivative of the earlier attitude. It is conceded that in some circumstances an analytic treatment shall be undertaken; but, if so, only doctors are to undertake it. The reason for this restriction then becomes a matter for enquiry. [183]

The question is limited in *place* because it does not arise in all countries with equal significance. In Germany and America it would be no more than an academic discussion; for in those countries every patient can have himself treated how and by whom he chooses, and anyone who chooses can, as a 'quack', handle any patients, provided only that he undertakes the responsibility for his actions.[1] The law does not intervene until it is called in to expiate some injury done to the patient. But in Austria, in which and for which I am writing, there is a preventive law, which forbids non-doctors from undertaking the treatment of patients, without waiting for its outcome.[2] So here the question whether laymen (= non-doctors) may treat patients by psychoanalysis has a practical sense. As soon as it is raised, however, it appears to be settled [184]

1 [This was actually true of only *certain* of the United States. It was also true of Great Britain.]

2 The same holds good in France.

by the wording of the law. Neurotics are patients, laymen are non-doctors, psychoanalysis is a procedure for curing or improving nervous disorders, and all such treatments are reserved to doctors. It follows that laymen are not permitted to practise analysis on neurotics, and are punishable if they nevertheless do so. The position being so simple, one hardly ventures to take up the question of lay analysis. All the same, there are some complications, which the law does not trouble about, but which nevertheless call for consideration. It may perhaps turn out that in this instance the patients are not like other patients, that the laymen are not really laymen, and that the doctors have not exactly the qualities which one has a right to expect of doctors and on which their claims should be based. If this can be proved, there will be justifiable grounds for demanding that the law shall not be applied without modification to the instance before us.

Whether this happens will depend on people who are not obliged to be familiar with the peculiarities of an analytic treatment. It is our task to give information on the subject to these impartial persons, whom we shall assume to be, at the moment, still in ignorance. It is to be regretted that we cannot let them be present as an audience at a treatment of this kind. But the 'analytic situation' allows of the presence of no third person. Moreover, the different sessions are of very unequal value. An unauthorized listener who hit upon a chance one of them would as a rule form no useful impression; he would be in danger of not understanding what was passing between the analyst and the patient, or he would be bored. For good or ill, therefore, he must be content with our information, which we shall try to make as trustworthy as possible. [185]

A patient, then, may be suffering from fluctuations in his moods which he cannot control, or from a sense of despondency by which his energy feels paralysed because he thinks he is incapable of doing anything properly, or from a nervous embarrassment among strangers. He may perceive, without understanding the reason for it, that he has difficulties in carrying out his professional work, or indeed any comparatively important decision or any undertaking. He may one day have suffered from a distressing attack – unknown in its origin – of feelings of anxiety, and since then have been unable, without a struggle, to walk along the street alone, or to travel by train; he may perhaps have had to give up both entirely. Or, a very remarkable thing, his thoughts may go their own way and refuse to be directed by his will. They pursue problems that are quite indifferent to him, but from which he cannot get free. Quite ludicrous tasks, too, are imposed on him, such as counting up the windows on the fronts of houses. And when he has performed simple actions such as posting a letter or turning off a gas-jet, he finds himself a moment later doubting whether he has really done so. This may be no more than an annoyance and a nuisance. But his state becomes intolerable if he suddenly finds he is unable to fend off the idea that he has pushed a child under the wheels of a car or has thrown a stranger off the bridge into the water, or if he has to ask himself whether he is not the murderer whom the police are looking for in connection with a crime that was discovered that day. It is obvious nonsense, as he himself knows; he has never done any harm to anyone; [186]

but if he were really the murderer who is being looked for, his feeling – his sense of guilt – could not be stronger.

Or again our patient – and this time let us make her a woman – may suffer in another way and in a different field. She is a pianist, but her fingers are overcome by cramp and refuse to serve her. Or when she thinks of going to a party she promptly becomes aware of a call of nature the satisfaction of which would be incompatible with a social gathering. She has therefore given up going to parties, dances, theatres or concerts. She is overcome by violent headaches or other painful sensations at times when they are most inconvenient. She may even be unable to keep down any meal she eats – which can become dangerous in the long run. And, finally, it is a lamentable fact that she cannot tolerate any agitations, which after all are inevitable in life. On such occasions she falls in a faint, often accompanied by muscular spasms that recall sinister pathological states.

Other patients, again, suffer from disturbances in a particular field in which emotional life converges with demands of a bodily sort. If they are men, they find they are incapable of giving physical expression to their tenderest feelings towards the opposite sex, while towards less loved objects they may perhaps have every reaction at their command. Or their sensual feelings attach them to people whom they despise and from whom they would like to get free; or those same feelings impose requirements on them whose fulfilment they themselves find repulsive. If they are women, they feel prevented by anxiety or disgust or by unknown obstructions from meeting the demands of sexual life; or, if they have surrendered to love, they find themselves cheated of the enjoyment which nature has provided as a reward for such compliance.

All these people recognize that they are ill and go to doctors, by whom people expect nervous disorders like these to be removed. The doctors, too, lay down the categories into which these complaints are divided. They diagnose them, each according to his own standpoint, under
[187] different names: neurasthenia, psychasthenia, phobias, obsessional neurosis, hysteria. They examine the organs which produce the symptoms, the heart, the stomach, the bowels, the genitals, and find them healthy. They recommend interruptions in the patient's accustomed mode of life, holidays, strengthening exercises, tonics, and by these means bring about temporary improvements – or no result at all. Eventually the patients hear that there are people who are concerned quite specially with the treatment of such complaints and start an analysis with them.

During this disquisition on the symptoms of neurotics, the Impartial

Person, whom I imagine as being present, has been showing signs of impatience. At this point, however, he becomes attentive and interested. 'So now', he says, 'we shall learn what the analyst does with the patient whom the doctor has not been able to help.'

Nothing takes place between them except that they talk to each other. The analyst makes use of no instruments – not even for examining the patient – nor does he prescribe any medicines. If it is at all possible, he even leaves the patient in his environment and in his usual mode of life during the treatment. This is not a necessary condition, of course, and may not always be practicable. The analyst agrees upon a fixed regular hour with the patient, gets him to talk, listens to him, talks to him in his turn and gets him to listen.

The Impartial Person's features now show signs of unmistakable relief and relaxation, but they also clearly betray some contempt. It is as though he were thinking: 'Nothing more than that? Words, words, words, as Prince Hamlet says.' And no doubt he is thinking too of Mephistopheles' mocking speech on how comfortably one can get along with words[1] – lines that no German will ever forget.

'So it is a kind of magic,' he comments: 'you talk, and blow away his ailments.'

Quite true. It *would* be magic if it worked rather quicker. An essential attribute of a magician is speed – one might say suddenness – of success. But analytic treatments take months and even years: magic that is so slow loses its miraculous character. And incidentally do not let us despise the *word*. After all, it is a powerful instrument; it is the means by which we convey our feelings to one another, our method of influencing [188]
other people. Words can do unspeakable good and cause terrible wounds. No doubt 'in the beginning was the deed'[2] and the word came later; in some circumstances it meant an advance in civilization when deeds were softened into words. But originally the word was magic – a magical act; and it has retained much of its ancient power.

The Impartial Person proceeds: 'Let us suppose that the patient is no better prepared to understand analytic treatment than I am; then how are you going to make him believe in the magic of the word or of the speech that is to free him from his sufferings?'

Some preparation must, of course, be given to him; and there is a simple way of doing it. We call on him to be completely straightforward with his analyst, to keep nothing back intentionally that comes into his

1 [In the scene with the student in *Faust*, Part I, Scene 4.]

2 ['Im Anfang war die Tat.' (Goethe, *Faust*, Part I, Scene 3.) Freud ended his *Totem and Taboo* (1912–13*a*) with this same quotation; *RSE*, **13**, 147.]

head, and then to put aside *every* reservation that might prevent his reporting certain thoughts or memories. Everyone is aware that there are some things in himself that he would be very unwilling to tell other people or that he considers it altogether out of the question to tell. These are his 'intimacies'. He has a notion too – and this represents a great advance in psychological self-knowledge – that there are other things that one would not care to admit *to oneself*: things that one likes to conceal from oneself and which for that reason one breaks off short and drives out of one's thoughts if, in spite of everything, they turn up. Perhaps he may himself notice that a very remarkable psychological problem begins to appear in this situation – of a thought of his own being kept secret from his own self [*Selbst*]. It looks as though his own self were no longer the unity which he had always considered it to be, as though there were something else as well in him that could confront that self. He may become obscurely aware of a contrast between a self and a mental life in the wider sense. If now he accepts the demand made by analysis that he shall say everything, he will easily become accessible to an expectation that to have relations and exchanges of thought with someone under such unusual conditions might also lead to peculiar results.

[189] 'I understand,' says our Impartial Person. 'You assume that every neurotic has something oppressing him, some secret. And by getting him to tell you about it you relieve his oppression and do him good. That, of course, is the principle of confession, which the Catholic Church has used from time immemorial in order to make secure its dominance over people's minds.'

We must reply: 'Yes and no!' Confession no doubt plays a part in analysis – as an introduction to it, we might say. But it is very far from constituting the essence of analysis or from explaining its effects. In confession the sinner tells what he knows; in analysis the neurotic has to tell more. Nor have we heard that confession has ever developed enough power to get rid of actual pathological symptoms.

'Then, after all, I do not understand,' comes the rejoinder. 'What can you possibly mean by "telling more than he knows"? But I can well believe that as an analyst you gain a stronger influence over your patients than a Father Confessor over his penitents, since your contacts with him are so much longer, more intensive and also more individual, and since you use this increased influence to divert him from his sick thoughts, to talk him out of his fears, and so on. It would certainly be strange if it were possible by such means to control purely physical phenomena as well, such as vomiting, diarrhoea, convulsions; but I know that influence like that is,

in fact, quite possible if a person is put into a state of hypnosis. By the trouble you take with the patient you probably succeed in bringing about a hypnotic relation of that sort with him – a suggestive attachment to yourself – even though you may not intend to; and in that case the miraculous results of your treatment are the effect of hypnotic suggestion. But, so far as I know, hypnotic treatment works much faster than your analysis, which, as you tell me, lasts for months and years.'

Our Impartial Person cannot be either so ignorant or so perplexed as we thought to begin with. There are unmistakable signs that he is trying to understand psychoanalysis with the help of his previous knowledge, that he is trying to link it up with something he already knows. The difficult task now lies ahead of us of making it clear to him that he will not succeed in this: that analysis is a procedure *sui generis*, something [190] novel and special, which can only be understood with the help of *new* insights – or hypotheses, if that sounds better. But he is still waiting for our answer to his last remarks.

What you say about the special personal influence of the analyst certainly deserves great attention. An influence of the kind exists and plays a large part in analysis – but not the same part as in hypnotism. It ought to be possible to convince you that the situations in the two cases are quite different. It may be enough to point out that we do not use this personal influence, the factor of 'suggestion', to suppress the symptoms of the illness, as happens with *hypnotic* suggestion. Further, it would be a mistake to believe that this factor is the vehicle and promoter of the treatment throughout its length. At its beginning, no doubt. But later on it opposes our analytic intentions and forces us to adopt the most far-reaching countermeasures. And I should like to show by an example how far diverting a patient's thoughts and talking him out of things are from the technique of analysis. If a patient of ours is suffering from a sense of guilt, as though he had committed a serious crime, we do not recommend him to disregard his qualms of conscience and do not emphasize his undoubted innocence; he himself has often tried to do so without success. What we do is to remind him that such a strong and persistent feeling must after all be based on something real, which it may perhaps be possible to discover.

'It would surprise me', comments the Impartial Person, 'if you were able to soothe your patients by agreeing with their sense of guilt in that way. But what *are* your analytic intentions? and what *do* you do with your patients?'

II

[191] If I am to say anything intelligible to you, I shall no doubt have to tell you something of a psychological theory which is not known or not appreciated outside analytic circles. It will be easy to deduce from this theory what we want from our patients and how we obtain it. I shall expound it to you dogmatically, as though it were a complete theoretical structure. But do not suppose that it came into being as such a structure, like a philosophical system. We have developed it very slowly, we have wrestled over every small detail of it, we have unceasingly modified it, keeping a continuous contact with observation, till it has finally taken a shape in which it seems to suffice for our purposes. Only a few years ago I should have had to clothe this theory in other terms. Nor, of course, can I guarantee to you that the form in which it is expressed today will remain the final one. Science, as you know, is not a revelation; long after its beginnings it still lacks the attributes of definiteness, immutability and infallibility for which human thought so deeply longs. But such as it is, it is all that we can have. If you will further bear in mind that our science is very young, scarcely as old as the century, and that it is concerned with what is perhaps the most difficult material that can be the subject of human research, you will easily be able to adopt the correct attitude towards my exposition. But interrupt me whenever you feel inclined, if you cannot follow me or if you want further explanations.

'I will interrupt you before you have even begun. You say that you intend to expound a new psychology to me; but I should have thought that psychology was no new science. There have been psychologies and psychologists enough; and I heard of great achievements in that field while I was at college.'

I should not dream of disputing them. But if you look into the matter more closely you will have to class these great achievements as belonging rather to the physiology of the sense organs. The theory of mental
Seele life [*Seelenleben*][T] could not be developed, because it was inhibited by a single essential misunderstanding. What does it comprise today, as it
[192] is taught at college? Apart from those valuable discoveries in the physiology of the senses, a number of classifications and definitions of our mental processes which, thanks to linguistic usage, have become the common property of every educated person. That is clearly not enough

to give a view [*Auffassung*][T] of our mental life. Have you not noticed that every philosopher, every imaginative writer, every historian and every biographer makes up his own psychology for himself, brings forward his own particular hypotheses concerning the interconnections and aims of mental acts – all more or less plausible and all equally untrustworthy? There is an evident lack of any common foundation. And it is for that reason too that in the field of psychology there is, so to speak, no respect and no authority. In that field everyone can 'run wild' as he chooses. If you raise a question in physics or chemistry, anyone who knows he possesses no 'technical knowledge' will hold his tongue. But if you venture upon a psychological assertion, you must be prepared to meet judgements and contradictions from every quarter. In this field, apparently, there is no 'technical knowledge'. Everyone has a mental life, so everyone regards himself as a psychologist. But that strikes me as an inadequate legal title. The story is told of how someone who applied for a post as a children's nurse was asked if she knew how to look after babies. 'Of course,' she replied, 'why, after all, I was a baby once myself.'

'And you claim that you have discovered this "common foundation" of mental life, which has been overlooked by every psychologist, from observations on *sick people*?'

The source of our findings does not seem to me to deprive them of their value. Embryology, to take an example, would not deserve to be trusted if it could not give a plain explanation of the origin of congenital malformations. I have told you of people whose thoughts go their own way, so that they are obliged to worry over problems to which they are perfectly indifferent. Do you think that academic psychology could ever make the smallest contribution towards explaining an abnormality such as that? And, after all, we all of us have the experience at night-time of our thoughts going their own way and creating things which we do not understand, which puzzle us, and which are suspiciously reminiscent of pathological products. Our dreams, I mean. The common people have always firmly believed that dreams have a sense and a value – that they [193]
mean something. Academic psychology has never been able to inform us what this meaning is. It could make nothing of dreams. If it attempted to produce explanations, they were non-psychological – such as tracing them to sensory stimuli, or to an unequal depth of sleep in different portions of the brain, and so on. But it is fair to say that a psychology which cannot explain dreams is also useless for an understanding of normal mental life, that it has no claim to be called a science.

'You are becoming aggressive; so you have evidently got on to a sensitive spot. I have heard, it is true, that in analysis great value is attached
Deutung to dreams, that they are interpreted [*deutet*]T, and that memories of real events are looked for behind them, and so on. But I have heard as well that the interpretation of dreams is left to the caprice of analysts, and that they themselves have never ceased disputing over the way of interpreting dreams and the justification for drawing conclusions from them. If that is so, you ought not to underline so heavily the advantage that analysis has won over academic psychology.'

There is really a great deal of truth in what you say. It is true that the interpretation of dreams has come to have unequalled importance both for the theory and the practice of analysis. If I seem to be aggressive, that is only a way of defending myself. And when I think of all the mischief some analysts have done with the interpretation of dreams I might lose heart and echo the pessimistic pronouncement of our great satirist Nestroy[1] when he says that every step forward is only half as big as it looks at first. But have you ever found that men do anything but confuse and distort what they get hold of? By the help of a little foresight and self-discipline most of the dangers of dream interpretation can be avoided with certainty. But you will agree that I shall never come to my exposition if we let ourselves be led aside like this.

'Yes. If I understood rightly, you wanted to tell me about the fundamental postulate of the new psychology.'

That was not what I wanted to begin with. My purpose is to let you
[194] hear what images [*Vorstellung*]T we have formed of the structure of the mental apparatus in the course of our analytic studies.

'What do you mean by the "mental apparatus"? and what, may I ask, is it constructed of?'

It will soon be clear what the mental apparatus is; but I must beg you not to ask what material [*Material*] it is constructed of. That is not a subject of psychological interest. Psychology can be as indifferent to it as, for instance, optics can be to the question of whether the walls of a telescope are made of metal or cardboard. We shall leave entirely on one side the *material* [*stofflichen*] line of approach,[2] but not so the *spatial* one. For we picture the unknown apparatus which serves the activities of the mind as being really like an instrument constructed of several parts (which we speak of as 'agencies' [*Instanzen*]), each of which

1 [Johann Nestroy (1801–62), famous in Vienna as a writer of comedies and farces. The remark is also quoted in 'Analysis Terminable and Interminable' (1937*c*), *RSE*, **23**, 206.]

2 [I.e. the question of what *stuff* the mental apparatus is constructed of.]

performs a particular *function* and which have a fixed spatial relation to one another: it being understood that by spatial relation – 'in front of' and 'behind', 'superficial' and 'deep' – we merely mean in the first instance a representation of the regular succession of the *functions*. Have I made myself clear?

'Scarcely. Perhaps I shall understand it later. But, in any case, here is a strange anatomy of the soul [*Seele*] – a thing which, after all, no longer exists at all for the scientists.'

What do you expect? It is a hypothesis like so many others in the sciences: the very earliest ones have always been rather rough. 'Open to revision'[1] we can say in such cases. It seems to me unnecessary for me to appeal here to the 'as if' which has become so popular. The value of a 'fiction' of this kind (as the philosopher Vaihinger[2] would call it) depends on how much one can achieve with its help.

But to proceed. Putting ourselves on the footing of everyday knowledge, we recognize in human beings a mental [*seelische*] organization [195] which is interpolated between their sensory stimuli and the perception of their somatic needs on the one hand and their motor acts on the other, and which mediates between them for a particular purpose. We call this organization their '*Ich*' ['ego', literally 'I'][T]. Now there is nothing new in this. Each one of us makes this assumption without being a philosopher, and some people even in spite of being philosophers. But this does not, in our opinion, exhaust the description of the mental apparatus. Besides this 'I', we recognize another mental region, more extensive, more imposing and more obscure than the 'I', and this we call the '*Es*' ['id', literally 'it']. The relation between the two must be our immediate concern.

You will probably protest at our having chosen simple pronouns to describe our two agencies or provinces instead of giving them orotund Greek names. In psychoanalysis, however, we like to keep in contact with the popular mode of thinking and prefer to make its concepts scientifically serviceable rather than to reject them. There is no merit in this; we are obliged to take this line; for our theories must be understood by our patients, who are often very intelligent, but not always learned. The impersonal 'it' is immediately connected with certain forms of expression used by normal people. 'It shot through me,' people

1 [In English in the original.]

2 [Hans Vaihinger (1852–1933). His philosophical system was enunciated in *Die Philosophie des Als Ob* (1911). The work had a considerable vogue in German-speaking countries, especially after the First World War. It was discussed by Freud at some length in Chapter V of *The Future of an Illusion* (1927*c*), *RSE*, **21**, 26–7.]

say; 'there was something in me at that moment that was stronger than me.' '*C'était plus fort que moi*.'[1]

In psychology we can describe things only by the help of analogies. There is nothing peculiar in this; it is the case elsewhere as well. But we have constantly to keep changing these analogies, for none of them lasts us long enough. Accordingly, in trying to make the relation between the ego and the id clear, I must ask you to picture the ego as a kind of façade of the id, as a frontage, like an external, cortical, layer of it. We can hold on to this last analogy. We know that cortical layers owe their peculiar characteristics to the modifying influence of the external medium on which they abut. Thus we suppose that the ego is the layer of the mental apparatus (of the id) which has been modified by the influence of the external world (of reality). This will show you how in psychoanalysis
[196] we take spatial ways of looking at things seriously. For us the ego is really something superficial and the id something deeper – looked at from outside, of course. The ego lies between reality and the id, which is what is truly mental.

'I will not ask any questions yet as to how all this can be known. But tell me first what you gain from this distinction between an ego and an id? What leads you to make it?'

Your question shows me the right way to proceed. For the important and valuable thing is to know that the ego and the id differ greatly from each other in several respects. The rules governing the course of mental acts are different in the ego and the id; the ego pursues different purposes and by other methods. A great deal could be said about this; but perhaps you will be content with a fresh analogy and an example. Think of the difference between 'the front' and 'behind the lines', as things were during the war. We were not surprised then that some things were different at the front from what they were behind the lines, and that many things were permitted behind the lines which had to be forbidden at the front. The determining influence was, of course, the proximity of the enemy; in the case of mental life it is the proximity of the external world. There was a time when 'outside', 'strange' and 'hostile' were identical concepts. And now we come to the example. In the id there are no conflicts; contradictions and antitheses persist side by side in it unconcernedly, and are often adjusted by the formation of compromises
Bildung [*Kompromissbildungen*][T]. In similar circumstances the ego feels a

1 [The conventional Latinate renditions of *Ich* and *Es* in English translation are, nevertheless, orotund. These terms – 'ego' and 'id' – are used for the remainder of this translation. For a full discussion of this issue, see *RSE*, **24**, 68–73.]

conflict which must be decided; and the decision lies in one urge being abandoned in favour of the other. The ego is an organization characterized by a very remarkable trend towards unification, towards synthesis. This characteristic is lacking in the id; it is, as we might say, 'all to pieces'; its different urges pursue their own purposes independently and regardless of one another.

'And if such an important mental region "behind the lines" exists, how can you explain its having been overlooked till the time of analysis?'

That brings us back to one of your earlier questions [p. 171 above]. Psychology had barred its own access to the region of the id by insisting on a postulate which is plausible enough but untenable: namely, that all mental acts are conscious to us – that being conscious[I] is the criterion [197] of what is mental, and that, if there are processes in our brain which are not conscious, they do not deserve to be called mental acts and are no concern of psychology.

'But I should have thought that was obvious.'

Yes, and that is what psychologists think. Nevertheless it can easily be shown to be false – that is, to be a quite inexpedient distinction. The idlest self-observation shows that ideas may occur to us which cannot have come about without preparation. But you experience nothing of these preliminaries of your thought, though they too must certainly have been of a mental nature; all that enters your consciousness is the ready-made result. Occasionally you can make these preparatory thought structures conscious *in retrospect* [*nachträglich*][T], as though in a reconstruction. *Nachträglichkeit*

'Probably one's attention was distracted, so that one failed to notice the preparations.'

Evasions! You cannot in that way get around the fact that acts of a mental nature, and often very complicated ones, can take place in you, of which your consciousness learns nothing and of which you know nothing. Or are you prepared to suppose that a greater or smaller amount of your 'attention' is enough to transform a non-mental act into a mental one? But what is the use of disputing? There are hypnotic

1 [Here written '*Bewusst-sein*', literally 'being conscioused'. This word (the ordinary word for 'consciousness') is, of course, normally written without a hyphen. The hyphen is inserted here to show that Freud is emphasizing the underlying passive sense of the word '*bewusst*'. Cf. the Editors' Note to Freud's paper on 'The Unconscious' (1915*e*), *RSE*, **14**, 146 *n*. The word is divided up in a similar way and for the same purpose near the beginning of Chapter I of *The Ego and the Id* (1923*b*), ibid., **19**, 11; but there it is printed in two separate words unconnected by a hyphen. Here the hyphen only appears in the original (1926) edition; it has been mistakenly omitted in the later German editions and the two parts of the word run together.]

experiments in which the existence of such non-conscious thoughts are irrefutably demonstrated to anyone who cares to learn.

'I shall not retract; but I believe I understand you at last. What you call "ego" is consciousness; and your "id" is the so-called subconscious that people talk about so much nowadays. But why the masquerading with the new names?'

[198] It is not masquerading. The other names are of no use. And do not try to give me literature instead of science. If someone talks of subconsciousness, I cannot tell whether he means the term topographically – to indicate something lying in the mind beneath consciousness – or qualitatively – to indicate another consciousness, a subterranean one, as it were. He is probably not clear about any of it. The only trustworthy antithesis is between conscious and unconscious. But it would be a serious mistake to think that this antithesis coincides with the distinction between ego and id. Of course, it would be delightful if it were as simple as that: our theory would have a smooth passage. But things are not so simple. All that is true is that everything that happens in the id is and remains unconscious, and that processes in the ego, and they alone, *can* become conscious. But not all of them are, nor always, nor necessarily; and large portions of the ego can remain permanently unconscious.

The becoming conscious of a mental process is a complicated affair. I cannot resist telling you – once again, dogmatically – our hypotheses about it. The ego, as you will remember, is the external, peripheral layer of the id. Now, we believe that on the outermost surface of this ego there is a special agency directed immediately to the external world, a system, an organ, through the excitation of which alone the phenomenon that we call consciousness comes about. This organ can be equally well excited from outside – thus receiving (with the help of the sense organs) the stimuli from the external world – and from inside – thus becoming aware, first, of the sensations in the id, and then also of the processes in the ego.

'This is getting worse and worse and I can understand it less and less. After all, what you invited me to was a discussion of the question whether laymen (= non-doctors) ought to undertake analytic treatments. What is the point, then, of all these disquisitions on daring and obscure theories which you cannot convince me are justified?'

I know I cannot convince you. That is beyond any possibility and for that reason beyond my purpose. When we give our pupils theoretical instruction in psychoanalysis, we can see how little impression we are making on them to begin with. They take in the theories of analysis as

coolly as other abstractions with which they are nourished. A few of them may perhaps *wish* to be convinced, but there is not a trace of their being so. But we also require that everyone who wants to practise analysis on other people shall first himself submit to an analysis. It is only in the course of this 'self-analysis' (as it is misleadingly termed),[1] when they actually experience as affecting their own person – or rather, their own mind – the processes asserted by analysis, that they acquire the convictions by which they are later guided as analysts. How then could I expect to convince you, the Impartial Person, of the correctness of our theories, when I can only put before you an abbreviated and therefore unintelligible account of them, without confirming them from your own experiences? [199]

I am acting with a different purpose. The question at issue between us is not in the least whether analysis is sensible or nonsensical, whether it is right in its hypotheses or has fallen into gross errors. I am unrolling our theories before you since that is the best way of making clear to you what the range of ideas is that analysis embraces, on the basis of what hypotheses it approaches a patient and what it does with him. In this way a quite definite light will be thrown on the question of lay analysis. And do not be alarmed. If you have followed me so far you have got over the worst. Everything that follows will be easier for you. – But now, with your leave, I will pause to take breath.

1 [This is now usually described as a 'training analysis'. 'Self-analysis', in the literal sense, is mentioned below, on p. 265 (Freud, 1926*c*).]

III

[200] 'I expect you will want to tell me how, on the basis of the theories of psychoanalysis, the origin of a neurotic illness can be pictured.'

I will try to. But for that purpose we must study our ego and our id from a fresh angle, from the *dynamic* one – that is to say, having regard to the forces [*Kräfte*][T] at work in them and between them. Hitherto we have been content with a *description* of the mental apparatus.

'My only fear is that it may become unintelligible again!'

I hope not. You will soon find your way about in it. Well then, we assume that the forces which drive [*treiben*] the mental apparatus into activity are produced in the bodily organs as an expression of the major somatic needs. You will recollect the words of our poet-philosopher: 'Hunger and love [are what moves the world].'[1] Incidentally, quite a formidable pair of forces! We give these bodily needs, insofar as they represent an instigation to mental activity, the name of '*Triebe*' [drives], a word for which we are envied by many modern languages.[2] Well, these drives fill the id: all the energy in the id, as we may put it briefly, originates from them. Nor have the forces in the ego any other origin; they are derived from those in the id. What, then, do these drives want? Satisfaction – that is, the establishment of situations in which the bodily needs can be extinguished. A lowering of the tension of need is felt by our organ of consciousness as pleasurable [*lustvoll*][T]; an increase of it is
Lust soon felt as unpleasure [*Unlust*]. From these oscillations arises the series of feelings of pleasure–unpleasure, in accordance with which the whole mental apparatus regulates its activity. In this connection we speak of a 'dominance of the pleasure principle'.

If the id's drive demands meet with no satisfaction, intolerable conditions arise. Experience soon shows that these situations of satisfaction
[201] can only be established with the help of the external world. At that point the portion of the id which is directed towards the external world – the ego – begins to function. If all the driving force that sets the vehicle in motion is derived from the id, the ego, as it were, undertakes the steering, without which no goal can be reached. The drives in the id press for immediate satisfaction at all costs, and in that way they achieve nothing or even bring about appreciable damage. It is the task of the ego to guard against such mishaps, to mediate between the claims of the id and the

1 [Schiller, 'Die Weltweisen'.]

2 [The English translation of this term is accordingly controversial. See *RSE*, **24**, 85–8, for a full discussion of this issue.]

objections of the external world. It carries on its activity in two directions. On the one hand, it observes the external world with the help of its sense organ, the system of consciousness, so as to catch the favourable moment for harmless satisfaction; and on the other hand it influences the id, bridles its 'passions', induces its drives to postpone their satisfaction, and indeed, if the necessity is recognized, to modify its aims, or, in return for some compensation, to give them up. Insofar as it tames the id's impulses in this way, it replaces the pleasure principle, which was formerly alone decisive, with what is known as the 'reality principle', which, though it pursues the same ultimate aims, takes into account the conditions imposed by the real external world. Later, the ego learns that there is yet another way of securing satisfaction besides the *adaptation* to the external world which I have described. It is also possible to intervene in the external world by *changing* it, and to establish in it intentionally the conditions which make satisfaction possible. This activity then becomes the ego's highest function; decisions as to when it is more expedient to control one's passions and bow before reality, and when it is more expedient to side with them and to take arms against the external world – such decisions make up the whole essence of worldly wisdom.

'And does the id put up with being dominated like this by the ego, in spite of being, if I understand you aright, the stronger party?'

Yes, all will be well if the ego is in possession of its whole organization and efficiency, if it has access to all parts of the id and can exercise its influence on them. For there is no natural opposition between ego and id; they belong together, and under healthy conditions cannot in practice be distinguished from each other.

'That sounds very pretty; but I cannot see how in such an ideal relation [202]
there can be the smallest room for a pathological disturbance.'

You are right. So long as the ego and its relations to the id fulfil these ideal conditions, there will be no neurotic disturbance. The point at which the illness makes its breach is an unexpected one, though no-one acquainted with general pathology will be surprised to find a confirmation of the principle that it is precisely the most important developments and differentiations that carry in them the seeds of illness, of failure of function.

'You are becoming too learned. I cannot follow you.'

I must go back a little bit further. A small living organism is a truly miserable, powerless thing, is it not? compared with the immensely powerful external world, full as it is of destructive influences. A primitive

organism, which has not developed any adequate ego organization, is at the mercy of all these 'traumas'. It lives by the 'blind' satisfaction of its drive wishes and often perishes in consequence. The differentiation of an ego is above all a step towards survival [*Lebenserhaltung*]. Nothing, it is true, can be learnt from being destroyed; but if one has luckily survived a trauma one takes notice of the approach of similar situations and signalizes the danger by an abbreviated repetition of the impressions one has experienced in connection with the trauma – by an
Angst *affect of anxiety* [*Angstaffekt*]T. This reaction to the perception of the danger now introduces an attempt at flight, which can have a life-saving effect till one has grown strong enough to meet the dangers of the external world in a more active fashion – even aggressively, perhaps.

'All this is very far away from what you promised to tell me.'

You have no notion how close I am to fulfilling my promise. Even in organisms which later develop an efficient ego organization, their ego is feeble and little differentiated from their id to begin with, during their first years of childhood. Imagine now what will happen if this powerless ego experiences a drive demand from the id which it would already like to resist (because it senses that to satisfy it is dangerous and would conjure up a traumatic situation, a collision with the external world) but
[203] which it cannot control, because it does not yet possess enough strength to do so. In such a case the ego treats the drive danger as if it was an external one; it makes an attempt at flight, draws back from this portion of the id and leaves it to its fate [*Schicksal*]T, after withholding from it all the contributions which it usually makes to drive impulses [*Trieb-*
Regung *regungen*]T. The ego, as we put it, institutes a *repression* of these drive impulses. For the moment this has the effect of fending off the danger; but one cannot confuse the inside and the outside with impunity. One cannot run away from oneself. In repression [*Verdrängung*]T the ego is following the pleasure principle, which it is usually in the habit of correcting; and it is bound to suffer damage in revenge. This lies in the ego's having permanently narrowed its sphere of influence. The repressed drive impulse is now isolated, left to itself, inaccessible, but also uninfluenceable. It goes its own way. Even later, as a rule, when the ego has grown stronger, it still cannot lift the repression; its synthesis is impaired, a part of the id remains forbidden ground to the ego. Nor does the isolated drive impulse remain idle; it understands how to make up for being
Versagung denied [*versagt*]T normal satisfaction; it produces psychical derivatives which take its place; it links itself to other processes which by its influence it likewise tears away from the ego; and finally it breaks through

into the ego and into consciousness in the form of an unrecognizably distorted substitute, and creates what we call a symptom. All at once the nature of a neurotic disorder becomes clear to us: on the one hand an ego which is inhibited [*gehemmt*]^{T} in its synthesis, which has no influence *Hemmung*
on parts of the id, which must renounce some of its activities in order to avoid a fresh collision with what has been repressed, and which exhausts itself in what are for the most part vain acts of defence [*Abwehraktionen*]^{T} against the symptoms, the derivatives of the repressed *Abwehr*
impulses; and on the other hand an id in which individual drives have made themselves independent, pursue their aims regardless of the interests of the person as a whole and henceforth obey the laws only of the primitive psychology that rules in the depths of the id. If we survey the whole situation we arrive at a simple formula for the origin of a neurosis: the ego has made an attempt to suppress certain portions of the id *in an inappropriate manner*, this attempt has failed and the id has taken its revenge. A neurosis is thus the result of a conflict between the ego and the id, upon which the ego has embarked because, as careful investiga- [204]
tion shows, it wishes at all costs to retain its adaptability in relation to the real external world. The disagreement is between the external world and the id; and it is because the ego, loyal to its inmost nature, takes sides with the external world that it becomes involved in a conflict with its id. But please observe that what creates the determinant for the illness is not the fact of this conflict – for disagreements of this kind between reality and the id are unavoidable and it is one of the ego's standing tasks to mediate in them – but the circumstance that the ego has made use of the inefficient instrument of repression for dealing with the conflict. But this in turn is due to the fact that the ego, at the time at which it was set the task, was undeveloped and powerless. The decisive repressions all take place in early childhood.

'What a remarkable business! I shall follow your advice and not make criticisms, since you only want to show me what psychoanalysis believes about the origin of neurosis so that you can go on to say how it sets about combating it. I should have various questions to ask and later on I shall raise some of them. But at the moment I myself feel tempted for once to carry your train of thought further and to venture upon a theory of my own. You have expounded the relation between external world, ego and id, and you have laid it down as the determinant of a neurosis that the ego in its dependence on the external world struggles against the id. Is not the opposite case conceivable of the ego in a conflict of this kind allowing itself to be dragged away by the id and disavowing

Verleugnung [*verleugnet*][T] its regard for the external world? What happens in a case like that? From my lay notions of the nature of insanity I should say that such a decision on the part of the ego might be the determinant of insanity. After all, a turning away of that kind from reality seems to be the essence of insanity.'

Yes. I myself have thought of that possibility,[1] and indeed I believe it meets the facts – though to prove the suspicion true would call for a discussion of some highly complicated considerations. Neuroses and psychoses are evidently intimately related, but they must nevertheless [205] differ in some decisive respect. That might well be the side taken by the ego in a conflict of this kind. In both cases the id would retain its characteristic of blind inflexibility.

'Well, go on! What hints on the treatment of neurotic illnesses does your theory give?'

It is easy now to describe our therapeutic aim. We try to restore the ego, to free it from its restrictions, and to give it back the command over the id which it has lost owing to its early repressions. It is for this one purpose that we carry out analysis, our whole technique is directed to this aim. We have to seek out the repressions which have been set up and to urge the ego to correct them with our help and to deal with conflicts better than by an attempt at flight. Since these repressions belong to the very early years of childhood, the work of analysis leads us, too, back to that period. Our path to these situations of conflict, which have for the most part been forgotten and which we try to revive in the patient's memory, is pointed out to us by his symptoms, dreams and free associations [*freien Einfälle*][T]. These must, however, first be interpreted – *Übersetzung* translated [*übersetzen*][T] – for, under the influence of the psychology of the id, they have assumed forms of expression that are strange to our comprehension. We may assume that whatever associations [*Einfällen*], thoughts and memories the patient is unable to communicate to us without internal struggles are in some way connected with the repressed material or are its derivatives. By encouraging the patient to disregard his resistances to telling us these things, we are educating his ego to overcome its inclination towards attempts at flight and to tolerate an approach to what is repressed. In the end, if the situation of the repression can be successfully reproduced in his memory, his compliance will be brilliantly rewarded. The whole difference between his age then and now works in his favour; and the thing from which his childish ego fled in terror will often seem to his adult and strengthened ego no more than child's play.

1 [Cf. Freud, 'Neurosis and Psychosis' (1924*b*), *RSE*, **19**, 141 ff.]

IV

'Everything you have told me so far has been psychology. It has often [206]
sounded strange, difficult or obscure; but it has always been – if I may put it so – "pure". I have known very little hitherto, no doubt, about your psychoanalysis; but the rumour has nevertheless reached my ears that you are principally occupied with things that have no claim to that predicate. The fact that you have not yet touched on anything of the kind makes me feel that you are deliberately keeping something back. And there is another doubt that I cannot suppress. After all, as you yourself say, neuroses are disturbances of mental life. Is it possible, then, that such important things as our ethics, our conscience, our ideals, play no part at all in these profound disturbances?'

So you feel that a consideration both of what is lowest and of what is highest has been missing from our discussions up till now? The reason for that is that we have not yet considered the *contents* of mental life at all. But allow me now for once myself to play the part of an interrupter who holds up the progress of the conversation. I have talked so much psychology to you because I wanted you to get the impression that the work of analysis is a part of applied psychology – and, moreover, of a psychology that is unknown outside analysis. An analyst must therefore first and foremost have learnt this psychology, this depth psychology or psychology of the unconscious, or as much of it at least as is known today. We shall need this as a basis for our later conclusions. But now, what was it you meant by your allusion to 'purity'?

'Well, it is generally reported that in analyses the most intimate – and the nastiest – events in sexual life [*Geschlechtslebens*][T] come up for dis- *Geschlecht*
cussion in every detail. If that is so – I have not been able to gather from your psychological discussions that it is necessarily so – it would be a strong argument in favour of restricting these treatments to doctors. How could one dream of allowing such dangerous liberties to people of whose discretion one was not sure and of whose character one had no guarantee?'

It is true that doctors enjoy certain privileges in the sphere of sex [*sexuellem Gebiet*]: they are even allowed to inspect people's genitals – though they were not allowed to in the East and though some idealistic [207]
reformers (you know whom I have in mind)[1] have disputed this

1 [No doubt Tolstoy and his followers. See the similar passage in a paper on transference love (1915*a*), *RSE*, **12**, 161.]

privilege. But you want to know in the first place whether it is so in analysis and why it must be so. – Yes, it is so.

And it must be so, firstly, because analysis is entirely founded on complete candour. Financial circumstances, for instance, are discussed with equal detail and openness: things are said that are kept back from every fellow citizen, even if he is not a competitor or a tax-collector. I will not dispute – indeed, I will myself insist with energy – that this obligation to candour puts a grave moral responsibility on the analyst as well. And it must be so, secondly, because factors from sexual life play an extremely important, a dominating, perhaps even a *specific* part among the causes and precipitating factors of neurotic illnesses. What else can analysis do but keep close to its subject matter, to the material brought up by the patient? The analyst never entices his patient on to the ground of sex. He does not say to him in advance: 'We shall be dealing with the intimacies of your sexual life!' He allows him to begin what he has to say wherever he pleases, and quietly waits until the patient himself touches on sexual things. I used always to warn my pupils: 'Our opponents have told us that we shall come upon cases in which the factor of sex plays no part. Let us be careful not to introduce it into our analyses and so spoil our chance of finding such a case.' But so far none of us has had that good fortune.

I am aware, of course, that our recognition of sexuality has become – whether admittedly or not – the strongest motive [*Motiv*]^{T} for other people's hostility to analysis. Can that shake our confidence? It merely shows us how neurotic our whole civilized life [*Kulturleben*]^{T} is, since ostensibly normal people do not behave very differently from neurotics. At a time when psychoanalysis was solemnly put on its trial before the learned societies of Germany – today things have grown altogether quieter – one of the speakers claimed to possess peculiar authority because, so he said, he even allowed his patients to talk: for diagnostic purposes, clearly, and to test the assertions of analysts. 'But', he added, [208] 'if they begin to talk about sexual matters I shut their mouths.' What do you think of that as a method of demonstration? The learned society applauded the speaker to the echo instead of feeling suitably ashamed on his account. Only the triumphant certainty afforded by the consciousness of prejudices held in common can explain this speaker's want of logical thought. Years later a few of those who had at that time been my followers gave in to the need to free human society from the yoke of sexuality which psychoanalysis was seeking to impose on it. One of them explained that what is sexual does not mean sexuality at all, but

Kultur

something else, something abstract and mystical. And another actually declared that sexual life is merely one of the spheres in which human beings seek to put in action their driving need for power and domination.[1] They have met with much applause, for the moment at least.

'I shall venture, for once in a way, to take sides on that point. It strikes me as extremely bold to assert that sexuality is not a natural, primitive need of living organisms, but an expression of something else. One need only take the example of animals.'

That makes no difference. There is no mixture, however absurd, that society will not willingly swallow down if it is advertised as an antidote to the dreaded predominance of sexuality.

I confess, moreover, that the dislike that you yourself have betrayed of assigning to the factor of sexuality so great a part in the causation of neurosis – I confess that this scarcely seems to me consistent with your task as an Impartial Person. Are you not afraid that this antipathy may interfere with your passing a just judgement?

'I am sorry to hear you say that. Your reliance on me seems to be shaken. But in that case why not have chosen someone else as your Impartial Person?'

Because that someone else would not have thought any differently from you. But if he had been prepared from the first to recognize the importance of sexual life, everyone would have exclaimed: 'Why, that is no Impartial Person, he is one of your supporters!' No, I am far from abandoning the expectation of being able to influence your opinions. I must admit, however, that from my point of view this situation is different from the one we dealt with earlier. As regards our psychological discussions it is a matter of indifference to me whether or not you believe me, provided only that you get an impression that what we are [209] concerned with are purely psychological problems. But here, as regards the question of sexuality, I should nevertheless be glad if you were accessible to the realization that your strongest motive for contradiction is precisely the ingrained hostility which you share with so many other people.

'But after all I am without the experience that has given you your unshakeable certainty.'

Very well. I can now proceed with my exposition. Sexual life is not simply something spicy; it is also a serious scientific problem. There was much that was novel to be learnt about it, many strange things to be

1 [References to the theories of Jung and Adler.]

explained. I told you just now that analysis has to go back into the early years of the patient's childhood, because the decisive repressions have taken place then, while his ego was feeble. But surely in childhood there is no sexual life? Surely it only starts at puberty? On the contrary. We have to learn that sexual drive impulses accompany life from birth onwards, and that it is precisely in order to fend off those drives that the infantile ego institutes repressions. A remarkable coincidence, is it not? that small children should already be struggling against the power [*Macht*][T] of sexuality, just as the speaker in the learned society was to do later, and later still my followers who have set up their own theories. How does that come about? The most general explanation would be that our civilization [*Kultur*] is built up entirely at the expense of sexuality; but there is much more to be said on the subject.

The discovery of infantile sexuality is one of those of which we have reason to feel ashamed [because of its obviousness].[1] A few paediatricians have, it seems, always known about it, and a few children's nurses. Clever men, who call themselves child psychologists, have thereupon spoken in tones of reproach of a 'desecration of the innocence of childhood'. Once again, sentiment instead of argument! Events of that kind are of daily occurrence in political bodies. A member of the opposition rises and denounces some piece of maladministration in the civil service, in the army, in the judiciary and so on. Upon this another member, preferably one of the government, declares that such statements are an
[210] affront to the sense of honour of the body politic, of the army, of the dynasty, or even of the nation. So they are as good as untrue. Feelings such as these can tolerate no affronts.

The sexual life of children is, of course, different from that of adults. The sexual function, from its beginnings to the definitive form in which it is so familiar to us, undergoes a complicated process of development. It grows together from numerous component drives with different aims and passes through several phases of organization till at last it comes into the service of reproduction. Not all the component drives are equally serviceable for the final outcome; they must be diverted, remodelled and in part suppressed. Such a far-reaching course of development is not always passed through without a flaw; inhibitions in development take place, partial fixations at early stages of development. If obstacles arise later on to the exercise of the sexual function, the sexual urge – the libido, as we call it – is apt to hark back to these earlier points of fixation.

1 [Cf. a similar passage in 'On the History of the Psychoanalytic Movement' (1914*d*), *RSE*, **14**, 15.]

The study of the sexuality of children and its transformations up to maturity has also given us the key to an understanding of what are known as the sexual perversions, which people used always to describe with all the requisite indications of disgust but whose origin they were never able to explain. The whole topic is of uncommon interest, but for the purposes of our conversation there is not much sense in telling you more about it. To find one's way about in it one, of course, needs anatomical and physiological knowledge, all of which is unfortunately not to be acquired in medical schools. But a familiarity with the history of civilization and with mythology is equally indispensable.

'After all that, I still cannot form any picture of the sexual life of children.'

Then I will pursue the subject further; in any case it is not easy for me to get away from it. I will tell you, then, that the most remarkable thing about the sexual life of children seems to me that it passes through the whole of its very far-reaching development in the first five years of life. From then onwards until puberty there stretches what is known as the period of latency. During it sexuality normally advances no further; on the contrary, the sexual urges diminish in strength and many things are given up and forgotten which the child did and knew. During that period of life, after the early efflorescence of sexuality has withered, [211] such attitudes of the ego as shame, disgust and morality arise, which are destined to stand up against the later tempest of puberty and to lay down the path of the freshly awakening sexual desires. This 'diphasic onset', as it is named, of sexual life has a great deal to do with the genesis of neurotic illnesses. It seems to occur only in human beings, and it is perhaps one of the determinants of the human privilege of becoming neurotic. The prehistory of sexual life was just as much overlooked before psychoanalysis as, in another department, the background to conscious mental life. You will rightly suspect that the two are intimately connected.

There is much to be told, for which our expectations have not prepared us, about the contents, manifestations[1] and achievements of this early period of sexuality. For instance, you will no doubt be surprised to hear how often little boys are afraid of being eaten up by their father. (And you may also be surprised at my including this fear among the phenomena of sexual life.) But I may remind you of the mythological tale which you may still recall from your schooldays of how the god Kronos

1 ['*Äusserungen*' in the first edition. In the later ones '*Änderungen* (changes)', probably a misprint.]

swallowed his children. How strange this must have sounded to you when you first heard it! But I suppose none of us thought about it at the time. Today we can also call to mind a number of fairy tales in which some ravenous animal like a wolf appears, and we shall recognize it as a disguise of the father. And this is an opportunity of assuring you that it was only through the knowledge of infantile sexuality that it became possible to understand mythology and the world of fairy tales. Here then something has been gained as a by-product of analytic studies.

You will be no less surprised to hear that male children suffer from a fear of being robbed of their sexual organ by their father, so that this fear of being castrated has a most powerful influence on the development of their character and in deciding the direction to be followed by their sexuality. And here again mythology may give you the courage to believe psychoanalysis. The same Kronos who swallowed his children also emasculated his father Uranus, and was afterwards himself emasculated in
[212] revenge by his son Zeus, who had been rescued through his mother's cunning. If you have felt inclined to suppose that all that psychoanalysis reports about the early sexuality of children is derived from the disordered imagination of the analysts, you must at least admit that their imagination has created the same product as the imaginative activities of primitive man, of which myths and fairy tales are the precipitate. The alternative, friendlier and probably also the more pertinent view would be that in the mental life of children today we can still detect the same archaic factors which were once dominant generally in the primaeval days of human civilization. In his mental development the child would be repeating the history of his race in an abbreviated form, just as embryology long since recognized was the case with somatic development.

Another characteristic of early infantile sexuality is that the female sexual organ proper as yet plays no part in it: the child has not yet discovered it. Stress falls entirely on the male organ, all the child's interest is directed towards the question of whether or not it is present. We know less about the sexual life of little girls than of boys. But we need not feel ashamed of this distinction; after all, the sexual life of adult women is a 'dark continent'[1] for psychology. But we have learnt that girls feel deeply their lack of a sexual organ that is equal in value to the male one; they regard themselves on that account as inferior, and this 'envy for the penis' is the origin of a whole number of characteristic feminine reactions.

It is also characteristic of children that their two excretory needs are

1 [In English in the original.]

cathected [*besetzt*][T] with sexual interest. Later on, education draws a sharp distinction here, which is once more obliterated in the practice of joking. It may seem to us an unsavoury fact, but it takes quite a long time for children to develop feelings of disgust. This is not disputed even by people who insist otherwise on the seraphic purity of the child's mind. *Besetzung*

Nothing, however, deserves more notice than the fact that children regularly direct their sexual wishes towards their nearest relatives – in the first place, therefore, towards their father and mother, and afterwards towards their brothers and sisters. The first object of a boy's love is his mother, and of a girl's her father (except insofar as an innate bisexual disposition favours the simultaneous presence of the contrary attitude). The other parent is felt as a disturbing rival and not infre- [213]
quently viewed with strong hostility. You must understand me aright. What I mean to say is not that the child wants to be treated by its favourite parent merely with the kind of affection which we adults like to regard as the essence of the parent–child relation. No, analysis leaves us in no doubt that the child's wishes extend beyond such affection to all that we understand by sensual satisfaction – so far, that is, as the child's powers of imagination [*Vorstellungsvermögen*] allow. It is easy to see that the child never guesses the actual facts of sexual intercourse; he replaces them with other notions derived from his own experience and feelings. As a rule his wishes culminate in the intention to bear, or in some indefinable way, to procreate a baby. Boys, too, in their ignorance, do not exclude themselves from the wish to bear a baby. We give the whole of this mental structure [*Aufbau*] the name of 'Oedipus complex', after the familiar Greek legend. With the end of the early sexual period it should normally be given up, should radically disintegrate and become transformed; and the results of this transformation are destined for important functions in later mental life. But as a rule this is not effected radically enough, in which case puberty brings about a revival of the complex, which may have serious consequences.

I am surprised that you are still silent. That can scarcely mean consent. – In asserting that a child's first choice of an object is, to use the technical term, an incestuous one, analysis no doubt once more hurt the most sacred feelings of humanity, and might well be prepared for a corresponding amount of disbelief, contradiction and attack. And these it has received in abundance. Nothing has damaged it more in the good opinion of its contemporaries than its hypothesis of the Oedipus complex as a structure universally bound to human destiny. The Greek myth, incidentally, must have had the same meaning; but the majority

of men today, learned and unlearned alike, prefer to believe that Nature has laid down an innate abhorrence in us as a guard against the possibility of incest.

But let us first summon history to our aid. When Caius Julius Caesar landed in Egypt, he found the young Queen Cleopatra (who was soon to become so important to him) married to her still younger brother Ptolemy. In an Egyptian dynasty there was nothing peculiar in this; the
[214] Ptolemies, who were of Greek origin, had merely carried on the custom which had been practised by their predecessors, the ancient Pharaohs, for a few thousand years. This, however, was merely brother-and-sister incest, which even at the present time is not judged so harshly. So let us turn to our chief witness in matters concerning primaeval times – mythology. It informs us that the myths of every people, and not only of the Greeks, are filled with examples of love affairs between fathers and daughters and even between mothers and sons. Cosmology, no less than the genealogy of royal races, is founded upon incest. For what purpose do you suppose these legends were created? To brand gods and kings as criminals? to fasten on them the abhorrence of the human race? Rather, surely, because incestuous wishes are a primordial human heritage and have never been fully overcome, so that their fulfilment was still granted to gods and their descendants when the majority of common humans were already obliged to renounce them. It is in complete harmony with these lessons of history and mythology that we find incestuous wishes still present and operative in the childhood of the individual.

'I might take it amiss that you tried to keep back all this about infantile sexuality from me. It seems to me most interesting, particularly on account of its connection with human prehistory.'

I was afraid it might take us too far from our purpose. But perhaps after all it will be of use.

'Now tell me, though, what certainty can you offer for your analytic findings on the sexual life of children? Is your conviction based solely on points of agreement with mythology and history?'

Oh, by no means. It is based on direct observation. What happened was this. We had begun by inferring the content of sexual childhood from the analysis of adults – that is to say, some twenty to forty years later. Afterwards, we undertook analyses on children themselves, and it was no small triumph when we were thus able to confirm in them everything that we had been able to divine, in spite of the amount to which it had been overlaid and distorted in the interval.

'What? You have had small children in analysis? Children of less than six years? *Can* that be done? And is it not most risky for the children?'

It can be done very well. It is hardly to be believed what goes on in a [215] child of four or five years old. Children are very active minded at that age; their early sexual period is also a period of intellectual flowering. I have an impression that with the onset of the latency period they become mentally inhibited as well, stupider. From that time on, too, many children lose their physical charm. And, as regards the damage done by early analysis, I may inform you that the first child on whom the experiment was ventured, nearly twenty years ago, has since then grown into a healthy and capable young man, who has passed through his puberty irreproachably, in spite of some severe psychical traumas. It may be hoped that things will turn out no worse for the other 'victims' of early analysis. Much that is of interest attaches to these child analyses; it is possible that in the future they will become still more important. From the point of view of theory, their value is beyond question. They give unambiguous information on problems which remain unsolved in the analyses of adults; and they thus protect the analyst from errors that might have momentous consequences for him. One surprises the factors that lead to the formation of a neurosis while they are actually at work and one cannot then mistake them. In the child's interest, it is true, analytic influence must be combined with educational measures. The technique has still to receive its shaping. But practical interest is aroused by the observation that a very large number of our children pass through a plainly neurotic phase in the course of their development. Since we have learnt how to look more sharply, we are tempted to say that neurosis in children is not the exception but the rule, as though it could scarcely be avoided on the path from the innate disposition of infancy to civilized society. In most cases this neurotic phase in childhood is overcome spontaneously. But may it not also regularly leave its traces in the average healthy adult? On the other hand, in those who are neurotics in later life we never fail to find links with the illness in childhood, though at the time it need not have been very noticeable. In a precisely analogous way physicians today, I believe, hold the view that each one of us has gone through an attack of tuberculosis in his childhood. It is true that in the case of the neuroses the factor of immunization does not operate, but only the factor of predisposition.

Let me return to your question about certainty. We have become quite [216] generally convinced from the direct analytic examination of children that we were right in our interpretation of what adults told us about

their childhood. In a number of cases, however, another sort of confirmation has become possible. The material of the analysis of some patients has enabled us to reconstruct certain external happenings, certain impressive events of their childhood years, of which they have preserved no conscious memory. Lucky accidents, information from parents or nurses, have afterwards provided irrefutable evidence that these occurrences which we had inferred really did take place. This, of course, has not happened often, but when it has it has made an overwhelming impression. The correct reconstruction, you must know, of such forgotten experiences of childhood always has a great therapeutic effect, whether or not they permit of objective confirmation.[1] These events owe their importance, of course, to their having occurred at such an early age, at a time when they could still produce a traumatic effect on the feeble ego.

'And what sort of events can these be, that have to be discovered by analysis?'

Various sorts. In the first place, impressions capable of permanently influencing the child's budding sexual life – such as observations of sexual activities between adults, or sexual experiences of his own with an adult or another child (no rare events); or, again, overhearing conversations, understood either at the time or retrospectively [*nachträglich*], from which the child thought it could draw conclusions about mysterious or uncanny matters; or again, remarks or actions by the child himself which give evidence of significant attitudes of affection or enmity towards other people. It is of special importance in an analysis to induce a memory of the patient's own forgotten sexual activity as a child and also of the intervention by the adults which brought it to an end.

'That gives me an opportunity of bringing up a question that I have long wanted to ask. What, then, is the nature of this "sexual activity" of children at an early age, which, as you say, was overlooked before the days of analysis?'

[217] It is an odd thing that the regular and essential part of this sexual activity was *not* overlooked. Or rather, it is by no means odd; for it was impossible to overlook it. Children's sexual impulses find their main expressions in self-gratification by friction of their own genitals, or, more precisely, of the male portion of them. The extraordinarily wide distribution of this form of childish 'naughtiness' was always known to adults, and it was regarded as a grave sin and severely punished. But

1 [Cf. Freud's later paper on this subject (1937*d*), *RSE*, **23**, 233 ff.]

please do not ask me how people could reconcile these observations of the immoral inclinations of children – for children do it, as they themselves say, because it gives them pleasure – with the theory of their innate purity and non-sensuality. You must get our opponents to solve this riddle. *We* have a more important problem before us. What attitude should we adopt towards the sexual activity of early childhood? We know the responsibility we are incurring if we suppress it; but we do not venture to let it take its course without restriction. Among races at a low level of civilization, and among the lower strata of civilized races, the sexuality of children seems to be given free rein. This probably provides a powerful protection against the subsequent development of neuroses in the individual. But does it not at the same time involve an extraordinary loss of the aptitude for cultural achievements? There is a good deal to suggest that here we are faced with a new Scylla and Charybdis.

But whether the interests which are stimulated by the study of the sexual life of neurotics create an atmosphere favourable to the encouragement of lasciviousness – *that* is a question which I venture to leave to your own judgement.

V

[218] 'I believe I understand your purpose. You want to show me what kind of knowledge is needed in order to practise analysis, so that I may be able to judge whether only doctors should have a right to do so. Well, so far very little to do with medicine has turned up: a great deal of psychology and a little biology or sexual science. But perhaps we have not got to the end?'

Decidedly not. There are still gaps to be filled. May I make a request? Will you describe how you now picture an analytic treatment? – just as though you had to undertake one yourself.

'A fine idea, to be sure! No, I have not the least intention of settling our controversy by an experiment of that sort. But just to oblige, I will do what you ask – the responsibility will be yours. Very well. I will suppose that the patient comes to me and complains of his troubles. I promise him recovery or improvement if he will follow my directions. I call on him to tell me with perfect candour everything that he knows and that occurs to him [*ihm einfällt*], and not to be deterred from that intention even if some things are disagreeable to say. Have I taken in the rule properly?'

Yes. You should add: 'even if what occurs to him seems unimportant or senseless.'

'I will add that. Thereupon he begins to talk and I listen. And what then? I infer from what he tells me the kind of impressions, experiences and wishes which he has repressed because he came across them at a time when his ego was still feeble and was afraid of them instead of dealing with them. When he has learnt this from me, he puts himself back in the old situations and with my help he manages better. The limitations to which his ego was tied then disappear, and he is cured. Is that right?'

Bravo! bravo! I see that once again people will be able to accuse me of having made an analyst of someone who is not a doctor. You have mastered it all admirably.

'I have done no more than repeat what I have heard from you – as though it was something I had learnt by heart. All the same, I cannot form any picture of how I should do it, and I am quite at a loss to under-
[219] stand why a job like that should take an hour a day for so many months. After all, an ordinary person has not as a rule experienced such a lot, and what was repressed in childhood is probably in every case the same.'

When one really practises analysis one learns all kinds of things besides. For instance: you would not find it at all such a simple matter to deduce from what the patient tells you the experiences he has forgotten and the drive impulses he has repressed. He says something to you which at first means as little to you as it does to him. You will have to make up your mind to look at the material which he delivers to you in obedience to the rule in a quite special way: as though it were ore, perhaps, from which its content of precious metal has to be extracted by a particular process. You will be prepared, too, to work over many tons of ore which may contain but little of the valuable material you are in search of. Here we should have a first reason for the prolonged character of the treatment.

'But how does one work over this raw material – to keep to your simile?'

By assuming that the patient's remarks and associations [*Einfälle*] are only distortions of what you are looking for – allusions, as it were, from which you have to guess what is hidden behind them. In a word, this material, whether it consists of memories, associations or dreams, has first to be *interpreted*. You will do this, of course, with an eye to the expectations you have formed as you listened, thanks to your special knowledge.

'"Interpret!" A nasty word! I dislike the sound of it; it robs me of all certainty. If everything depends on my interpretation who can guarantee that I interpret right? So after all everything *is* left to my caprice.'

Just a moment! Things are not quite as bad as that. Why do you choose to except your own mental processes from the rule of law which you recognize in other people's? When you have attained some degree of self-discipline and have certain knowledge at your disposal, your interpretations will be independent of your personal characteristics and will hit the mark. I am not saying that the analyst's personality is a matter of indifference for this portion of his task. A kind of sharpness of hearing for what is unconscious and repressed, which is not possessed equally by everyone, has a part to play. And here, above all, we are [220] brought to the analyst's obligation to make himself capable, by a deep-going analysis of his own, of the unprejudiced reception of the analytic material. Something, it is true, still remains over: something comparable to the 'personal equation' in astronomical observations. This individual factor will always play a larger part in psychoanalysis than elsewhere. An abnormal person can become an accurate physicist; as an analyst he

will be hampered by his own abnormality from seeing the pictures [*Bilder*] of mental life undistorted. Since it is impossible to demonstrate to anyone his own abnormality, general agreement in matters of depth psychology will be particularly hard to reach. Some psychologists, indeed, think it is quite impossible and that every fool has an equal right to give out his folly as wisdom. I confess that I am more of an optimist about this. After all, our experiences show that fairly satisfactory agreements can be reached even in psychology. Every field of research has its particular difficulty which we must try to eliminate. And, moreover, even in the interpretative art of analysis there is much that can be learnt like any other material of study: for instance, in connection with the peculiar method of indirect representation through symbols.

'Well, I no longer have any desire [*Lust*] to undertake an analytic treatment even in my imagination. Who can say what other surprises I might meet with?'

You are quite right to give up the notion. You see how much more training and practice would be needed. When you have found the right interpretation, another task lies ahead. You must wait for the right moment at which you can communicate your interpretation to the patient with some prospect of success.

'How can one always tell the right moment?'

That is a question of tact, which can become more refined with experience. You will be making a bad mistake if, in an effort, perhaps, at shortening the analysis, you throw your interpretations at the patient's head as soon as you have found them. In that way you will draw expressions of resistance, rejection and indignation from him; but you will not enable his ego to master his repressed material. The formula is: to wait till he has come so near to the repressed material that he has only a few more steps to take under the lead of the interpretation you propose.

[221] 'I believe I should never learn to do that. And if I carry out these precautions in making my interpretation, what next?'

It will then be your fate to make a discovery for which you were not prepared.

'And what may that be?'

That you have been deceived in your patient; that you cannot count in the slightest on his collaboration and compliance; that he is ready to place every possible difficulty in the way of your common work – in a word, that he has no wish whatever to be cured.

'Well! that is the craziest thing you have told me yet. And I do not

believe it either. The patient who is suffering so much, who complains so movingly about his troubles, who is making so great a sacrifice for the treatment – you say he has no wish to be cured! But of course you do not mean what you say.'

Calm yourself! I *do* mean it. What I said was the truth – not the whole truth, no doubt, but a very noteworthy part of it. The patient wants to be cured – but he also wants not to be. His ego has lost its unity, and for that reason his will has no unity either. If that were not so, he would be no neurotic.

'"Were I sagacious, I should not be Tell!"'[1]

The derivatives of what is repressed have broken into his ego and established themselves there; and the ego has as little control over trends from that source as it has over what is actually repressed, and as a rule it knows nothing about them. These patients, indeed, are of a peculiar nature and raise difficulties with which we are not accustomed to reckon. All our social institutions are framed for people with a united and normal ego, which one can classify as good or bad, which either fulfils its function or is altogether eliminated by an overpowering influence. Hence the juridical alternative: responsible or irresponsible. None of these distinctions applies to neurotics. It must be admitted that there is difficulty in adapting social demands to their psychological condition. This was experienced on a large scale during the last war. Were the neurotics who evaded service malingerers or not? They were both. If they were treated as malingerers and if their illness was made highly uncomfortable, they recovered; if after being ostensibly restored they [222] were sent back into service, they promptly took flight once more into illness. Nothing could be done with them. And the same is true of neurotics in civil life. They complain of their illness but exploit it with all their strength; and if someone tries to take it away from them they defend it like the proverbial lioness with her young. Yet there would be no sense in reproaching them for this contradiction.

'But would not the best plan be not to give these difficult people any treatment at all, but to leave them to themselves? I cannot think it is worthwhile to expend such great efforts over each of them as you lead me to suppose that you make.'

I cannot approve of your suggestion. It is undoubtedly a more proper line to accept the complications of life rather than struggle against them. It may be true that not every neurotic whom we treat is worth the expenditure of an analysis; but there are some very valuable individuals

1 ['Wär' ich besonnen, hiess ich nicht der Tell.' Schiller, *Wilhelm Tell*, Act III, Scene 3.]

among them as well. We must set ourselves the goal of bringing it about that as few human beings as possible enter civilized life with such a defective mental equipment. And for that purpose we must collect much experience and learn to understand many things. Every analysis can be instructive and bring us a yield of new understanding quite apart from the personal value of the individual patient.

'But if a volitional impulse has been formed in the patient's ego which wishes to retain the illness, it too must have its reasons [*Gründe*] and motives [*Motive*] and be able in some way to justify itself. But it is impossible to see why anyone should want to be ill or what he can get out of it.'

Oh, that is not so hard to understand. Think of the war neurotics, who do not have to serve, precisely because they are ill. In civil life illness can be used as a screen to gloss over incompetence in one's profession or in competition with other people; while in the family it can serve as a means for extorting from the other members sacrifices and proofs of their love[1] or for imposing one's will upon them. All of this lies fairly near the surface; we sum it up in the term 'gain from illness'. It is curious, however, that the patient – that is, his ego – nevertheless knows nothing of the whole concatenation of these motives and the actions which they involve. One combats the influence of these trends by compelling the ego to take cognizance of them. But
[223] there are other motives, that lie still deeper, for holding on to being ill, which are not so easily dealt with. But these cannot be understood without a fresh journey into psychological theory.

'Please go on. A little more theory will make no odds now.'

When I described the relation between the ego and the id to you, I suppressed an important part of the theory of the mental apparatus. For we have been obliged to assume that within the ego itself a particular agency has become differentiated, which we name the superego [*Über-Ich*]. This superego occupies a special position between the ego and the id. It belongs to the ego and shares its high degree of psychological organization; but it has a particularly intimate connection with the id. It is, in fact, a precipitate of the first object cathexes of the id and is the heir to the Oedipus complex after its demise. This superego can confront the ego and treat it like an object; and it often treats it very harshly. It is as important for the ego to remain on good terms with the

1 [*um die anderen zu Opfern und Liebesbeweisen zu zwingen*. In the *SE* translation the noun *Opfern* was mistaken for a verb, and the phrase was accordingly mistranslated 'for sacrificing the other members and extorting proofs of their love'.]

superego as with the id. Estrangements between the ego and the superego are of great significance in mental life. You will already have guessed that the superego is the vehicle of the phenomenon that we call conscience. Mental health very much depends on the superego's being normally developed – that is, on its having become sufficiently impersonal. And that is precisely what it is not in neurotics, whose Oedipus complex has not passed through the correct process of transformation. Their superego still confronts their ego as a strict father confronts a child; and their morality operates in a primitive fashion in that the ego gets itself punished by the superego. Illness is employed as an instrument for this 'self-punishment', and neurotics have to behave as though they were governed by a sense of guilt which, in order to be satisfied, needs to be punished by illness.

'That really sounds most mysterious. The strangest thing about it is that apparently even this mighty force of the patient's conscience does not reach his consciousness.'

Yes, we are only beginning to appreciate the significance of all these important circumstances. That is why my description was bound to turn out so obscure. But now I can proceed. We describe all the forces that oppose the work of recovery as the patient's 'resistances'. The gain from illness is one such resistance. The 'unconscious sense of guilt' [*unbewusste Schuldgefühl*] represents the superego's resistance; it is the most [224] powerful factor, and the one most dreaded by us. We meet with still other resistances during the treatment. If the ego during the early period has set up a repression out of fear [*Angst*], then the fear still persists and manifests itself as a resistance if the ego approaches the repressed material. And finally, as you can imagine, there are likely to be difficulties if a drive process which has been going along a particular path for whole decades is suddenly expected to take a new path that has just been made open for it. That might be called the id's resistance. The struggle against all these resistances is our main work during an analytic treatment; the task of making interpretations is nothing compared to it. But as a result of this struggle and of the overcoming of the resistances, the patient's ego is so much altered and strengthened that we can look forward calmly to his future behaviour when the treatment is over. On the other hand, you can understand now why we need such long treatments. The length of the path of development and the wealth of the material are not the decisive factors. It is more a question of whether the path is clear. An army can be held up for weeks on a stretch of country which in peacetime an express train crosses in a couple

of hours – if the army has to overcome the enemy's resistance there. Such battles call for time in mental life too. I am unfortunately obliged to tell you that every effort to hasten analytic treatment appreciably has hitherto failed. The best way of shortening it seems to be to carry it out according to the rules.

'If I ever felt any desire to poach on your preserves and try my hand at analysing someone else, what you tell me about the resistances would have cured me of it. But how about the special personal influence that you yourself have after all admitted? Does not that come into action against the resistances?'

It is a good thing that you have asked me about that. This personal influence is our most powerful dynamic weapon. It is the new element which we introduce into the situation and by means of which we make it fluid. The intellectual content of our explanations cannot do it, for the patient, who shares all the prejudices of the world around him, need believe us as little as our scientific critics do. The neurotic sets to work
[225] because he has faith in the analyst, and he believes him because he acquires a special emotional attitude towards the figure of the analyst. Children, too, only believe people they are attached to. I have already told you [p. 169 above] what use we make of this particularly large 'suggestive' influence. Not for suppressing the symptoms – this distinguishes the analytic method from other psychotherapeutic procedures – but as a driving force [*Triebkraft*] to induce the patient to overcome his resistances.

'Well, and if that succeeds, does not everything then go smoothly?'

Yes, it ought to. But there turns out to be an unexpected complication. It was perhaps the greatest of the analyst's surprises to find that the emotional relation which the patient adopts towards him is of a quite peculiar nature. The very first doctor[1] who attempted an analysis – it was not myself – came up against this phenomenon and did not know what to make of it. For this emotional relation is, to put it plainly, in the nature of falling in love. Strange, is it not? Especially when you take into account that the analyst does nothing to provoke it but on the contrary rather keeps at a distance from the patient, speaking humanly, and surrounds himself with some degree of reserve – when you learn besides that this odd love relationship disregards anything else that is really propitious and every variation in personal attraction, age, sex or class.
Zwang This love is of a positively compulsive [*zwangsläufig*][T] kind. Not that that characteristic need be absent from spontaneous falling in love. As

1 [A reference to Breuer and his treatment of Anna O.]

you know, the contrary is often the case. But in the analytic situation it makes its appearance with complete regularity without there being any rational explanation for it. One would have thought that the patient's relation to the analyst called for no more than a certain amount of respect, trust, gratitude and human sympathy. Instead, there is this falling in love, which itself gives the impression of being a pathological phenomenon.

'I should have thought all the same that it would be favourable for your analytic purposes. If someone is in love, he is amenable, and he will do anything in the world for the sake of the other person.'

Yes. It *is* favourable to start with. But when this falling in love has grown deeper, its whole nature comes to light, much of which is incompatible with the task of analysis. The patient's love is not satisfied with being obedient; it grows exacting, calls for affectionate and sensual satisfactions, it demands exclusiveness, it develops jealousy, and it shows more and more clearly its reverse side, its readiness to become hostile and revengeful if it cannot obtain its ends. At the same time, like all falling in love, it pushes away all other mental material; it extinguishes interest in the treatment and in recovery – in short, there can be no doubt that it has taken the place of the neurosis and that our work has had the result of driving out one form of illness with another. [226]

'That does sound hopeless! What can be done about it? The analysis would have to be given up. But if, as you say, the same thing happens in every case, it would be impossible to carry through any analyses at all.'

We will begin by using the situation in order to learn something from it. What we learn may then perhaps help us to master it. Is it not an extremely noteworthy fact that we succeed in transforming every neurosis, whatever its content, into a condition of pathological love?

Our conviction that a portion of erotic life that has been abnormally employed lies at the basis of neuroses must be unshakeably strengthened by this experience. With this discovery we are once more on a firm footing and can venture to make this love itself the object of analysis. And we can make another observation. Analytic love is not manifested in every case as clearly and blatantly as I have tried to depict it. Why not? We can soon see. In proportion as the purely sensual and the hostile sides of his love try to show themselves, the patient's opposition to them is aroused. He struggles against them and tries to repress them before our very eyes. And now we understand what is happening. The patient is *repeating* in the form of falling in love with the analyst mental experiences which he has already been through once before; he has *transferred*

Übertragung [*übertragen*][T] on to the analyst mental attitudes that were lying ready in him and were intimately connected with his neurosis. He is also repeating before our eyes his old defensive actions; he would like best to repeat in his relation to the analyst *all* the history of that forgotten period of his life. So what he is showing us is the kernel of his intimate life history: *he is reproducing it tangibly, as though it were actually happening, instead of remembering it*. In this way the riddle of the transference love is [227] solved and the analysis can proceed on its way – with the *help* of the new situation which had seemed such a menace to it.

'That is very cunning. And is the patient so easy to convince that he is not in love but only obliged to stage a revival of an old piece?'

Everything now depends on that. And the whole skill in handling the 'transference' [*Übertragung*] is devoted to bringing it about. As you see, the requirements of analytic technique reach their maximum at this point. Here the gravest mistakes can be made or the greatest successes be registered. It would be folly to attempt to evade the difficulties by suppressing or neglecting the transference; whatever else had been done in the treatment, it would not deserve the name of an analysis. To send the patient away as soon as the inconveniences of his transference neurosis make their appearance would be no more sensible, and would moreover be cowardly. It would be as though one had conjured up spirits and run away from them as soon as they appeared. Sometimes, it is true, nothing else is possible. There are cases in which one cannot master the unleashed transference and the analysis has to be broken off; but one must at least have struggled with the evil spirits to the best of one's strength. To yield to the demands of the transference, to fulfil the patient's wishes for affectionate and sensual satisfaction, is not only justly forbidden [*versagt*] by moral considerations but is also completely ineffective as a technical method for attaining the purpose of the analysis. A neurotic cannot be cured by being enabled to reproduce uncorrected an unconscious stereotype plate that is ready to hand in him. If one engages in compromises with him by offering him partial satisfactions in exchange for his further collaboration in the analysis, one must beware of falling into the ridiculous situation of the cleric who was supposed to convert a sick insurance agent. The sick man remained unconverted but the cleric took his leave insured. The only possible way out of the transference situation is to trace it back to the patient's past, as he really experienced it or as he pictured it through the wish-fulfilling activity of his imagination. And this demands from the analyst much skill, patience, calm and self-abnegation.

'And where do you suppose the neurotic experienced the prototype of his transference love?'

In his childhood: as a rule in his relation with one of his parents. You will remember what importance we had to attribute to these earliest emotional ties. So here the circle closes. [228]

'Have you finished at last? I am feeling just a little bewildered with all I have heard from you. Only tell me one thing more: how and where can one learn what is necessary for practising analysis?'

There are at the moment two institutes at which instruction in psychoanalysis is given. The first has been founded in Berlin by Dr Max Eitingon, who is a member of the Society there. The second is maintained by the Vienna Psychoanalytical Society at its own expense and at considerable sacrifice. The part played by the authorities is at present limited to the many difficulties which they put in the way of the young undertaking. A third training institute is at this moment being opened in London by the Society there, under the direction of Dr Ernest Jones. At these institutes the candidates themselves are taken into analysis, receive theoretical instruction through lectures on all the subjects that are important for them, and enjoy the supervision of older and more experienced analysts when they are allowed to make their first trials with comparatively slight cases. A period of some two years is calculated for this training. Even after this period, of course, the candidate is only a beginner and not yet a master. What is still needed must be acquired by practice and by an exchange of ideas in the psychoanalytical societies in which young and old members meet together. Preparation for analytic activity is by no means so easy and simple. The work is hard, the responsibility great. But anyone who has passed through such a course of instruction, who has been analysed himself, who has mastered what can be taught today of the psychology of the unconscious, who is at home in the science of sexual life, who has learnt the delicate technique of psychoanalysis, the art of interpretation, of fighting resistances and of handling the transference – anyone who has accomplished all this *is no longer a layman in the field of psychoanalysis*. He is capable of undertaking the treatment of neurotic disorders, and will be able in time to achieve in that field whatever can be required from this form of therapy.[1]

1 [Much of the material in this chapter is derived, in some passages almost word for word, from Freud's earlier papers on technique (*RSE*, **12**).]

VI

[229] 'You have expended a great deal of effort on showing me what psychoanalysis is and what sort of knowledge is needed in order to practise it with some prospect of success. Very well. Listening to you can have done me no harm. But I do not know what influence on my judgement you expect your explanations to have. I see before me a case which has nothing unusual about it. The neuroses are a particular kind of illness and analysis is a particular method of treating them – a specialized branch of medicine. It is the rule in other cases as well for a doctor who has chosen a special branch of medicine not to be satisfied with the education that is confirmed by his diploma: particularly if he intends to set up in a fairly large town, such as can alone offer a livelihood to specialists. Anyone who wants to be a surgeon tries to work for a few years at a surgical clinic, and similarly with oculists, laryngologists and so on – to say nothing of psychiatrists, who are perhaps never able to get away from a state institution or a sanatorium. And the same will happen in the case of psychoanalysts: anyone who decides in favour of this new specialized branch of medicine will, when his studies are completed, take on the two years' training you spoke of in a training institute, if it really requires so much time. He will realize afterwards, too, that it is to his advantage to keep up his contact with his colleagues in a psychoanalytical society, and everything will go along swimmingly. I cannot see where there is a place in this for the question of lay analysis.'

A doctor who does what you have promised on his behalf will be welcome to all of us. Four-fifths of those whom I recognize as my pupils are in any case doctors. But allow me to point out to you how the relations of doctors to analysis have really developed and how they will probably continue to develop. Doctors have no historical claim to the sole possession of analysis. On the contrary, until recently they have met it with everything possible that could damage it, from the shallowest ridicule to the gravest calumny. You will justly reply that that belongs to the past and need not affect the future. I agree, but I fear the future will be different from what you have foretold.

[230] Permit me to give the word 'quack' the meaning it ought to have instead of the legal one. According to the law a quack is anyone who treats patients without possessing a state diploma to prove he is a

doctor. I should prefer another definition: a quack is anyone who undertakes a treatment without possessing the knowledge and capacities necessary for it. Taking my stand on this definition, I venture to assert that – not only in European countries – doctors form a preponderating contingent of quacks in analysis. They very frequently practise analytic treatment without having learnt it and without understanding it.

It is no use your objecting that that is unconscientious and that you cannot believe doctors capable of it; that after all a doctor knows that a medical diploma is not a letter of marque[1] and that a patient is not an outlaw; and that one must always grant to a doctor that he is acting in good faith even if he may perhaps be in error.

The facts remain; we will hope that they can be accounted for as you think. I will try to explain to you how it becomes possible for a doctor to act in connection with psychoanalysis in a manner which he would carefully avoid in every other field.

The first consideration is that in his medical school a doctor receives a training which is more or less the opposite of what he would need as a preparation for psychoanalysis. His attention has been directed to objectively ascertainable facts of anatomy, physics and chemistry, on the correct appreciation and suitable influencing of which the success of medical treatment depends. The problem of life is brought into his field of vision so far as it has hitherto been explained to us by the play of forces which can also be observed in inanimate nature. His interest is not aroused in the mental side of vital phenomena; medicine is not concerned with the study of the higher cognitive functions, which lies in the sphere of another faculty. Only psychiatry is supposed to deal with the disturbances of mental functions; but we know in what manner and with what aims it does so. It looks for the somatic determinants of mental disorders and treats them like other causes of illness.

Psychiatry is right to do so and medical education is clearly excellent. If it is described as one-sided, one must first discover the standpoint from which one is making that characteristic into a reproach. In itself [231]
every science is one-sided. It must be so, since it restricts itself to particular subjects, points of view and methods. It is a piece of nonsense in which I would take no part to play off one science against another. After all, physics does not diminish the value of chemistry; it cannot take its place but, on the other hand, cannot be replaced by it. Psychoanalysis is certainly quite particularly one-sided, as being the science of the

1 [I.e. does not give him a privateer's licence.]

mental unconscious. We must not therefore dispute to the medical sciences their right to be one-sided.

We shall find the standpoint we are in search of only if we turn from scientific medicine to practical therapeutics. A sick person is a complicated organism. He may remind us that even the mental phenomena which are so hard to grasp should not be effaced from the picture of life. Neurotics, indeed, are an undesired complication, an embarrassment as much to therapeutics as to jurisprudence and to military service. But they exist and are a particular concern of medicine. Medical education, however, does nothing, literally nothing, towards their understanding and treatment. In view of the intimate connection between the things that we distinguish as physical and mental, we may look forward to a day when paths of knowledge and, let us hope, of influence will be opened up, leading from organic biology and chemistry to the field of neurotic phenomena. That day still seems a distant one, and for the present these illnesses are inaccessible to us from the direction of medicine.

It would be tolerable if medical education merely failed to give doctors any orientation in the field of the neuroses. But it does more: it gives them a false and detrimental attitude. Doctors whose interest has not been aroused in the psychical factors of life are all too ready to form a low estimate of them and to ridicule them as unscientific. For that reason they are unable to take anything really seriously which has to do with them and do not recognize the obligations which derive from them. They therefore fall into the layman's lack of respect for psychological research and make their own task easy for themselves. – No doubt, neurotics have to be treated, since they are sick people and come to the doctor; and one must always be ready to experiment with something new. But why burden oneself with a tedious preparation? We shall
[232] manage all right; who can tell if what they teach in the analytic institutes is any good? – The less such doctors understand about the matter, the more venturesome they become. Only a man who really knows is modest, for he knows how insufficient his knowledge is.

The comparison which you brought up to pacify me, between specialization in analysis and in other branches of medicine, is thus not applicable. For surgery, ophthalmology, and so on, the medical school itself offers an opportunity for further education. The analytic training institutes are few in number, young in years, and without authority. The medical schools have not recognized them and take no notice of them. The young doctor, who has had to take so much on trust from his

teachers that he has had little occasion for educating his judgement, will gladly seize an occasion for playing the part of a critic for once in a field in which there is as yet no recognized authority.

There are other things too that favour his appearing as an analytic quack. If he tried to undertake eye operations without sufficient preparation, the failure of his cataract extractions and iridectomies and the absence of patients would soon bring his hazardous enterprise to an end. The practice of analysis is comparatively safe for him. The public is spoilt by the average successful outcome of eye operations and expects cure from the surgeon. But if a 'nerve specialist' fails to restore his patients no-one is surprised. People have not been spoilt by successes in the therapy of the neuroses; the nerve specialist has at least 'taken a lot of trouble with them'. Indeed, there is not much that can be done; nature must help, or time. With women there is first menstruation, then marriage, and later on the menopause. Finally, death is a real help. Moreover, what the medical analyst has done with his neurotic patient is so inconspicuous that no reproach can attach to it. He has made use of no instruments or medicines; he has merely conversed with him and tried to talk him into or out of something. Surely that can do no harm, especially if he avoids touching on distressing or agitating subjects. The medical analyst, who has avoided any strict teaching, will, no doubt, not have omitted an attempt to improve analysis, to pull out its poison fangs and make it pleasant for the patient. And it will be wise for him to stop there; for if he really ventures to call up resistances and then does not know how to meet them, he may in true earnest make himself [233] unpopular.

Honesty compels me to admit that the activity of an untrained analyst does less harm to his patients than that of an unskilled surgeon. The possible damage is limited to the patient having been led into useless expenditure and having his chances of recovery removed or diminished. Furthermore, the reputation of analytic therapy has been lowered. All this is most undesirable, but it bears no comparison with the dangers that threaten from the knife of a surgical quack. In my judgement, severe or permanent aggravations of a pathological condition are not to be feared even with an unskilled use of analysis. The unwelcome reactions cease after a while. Compared with the traumas of life which have provoked the illness, a little mishandling by the doctor is of no account. It is simply that the unsuitable attempt at a cure has done the patient no good.

'I have listened to your account of the medical quack in analysis

without interrupting you, though I formed an impression that you are dominated by a hostility against the medical profession to the historical explanation of which you yourself have pointed the way. But I will grant you one thing: if analyses are to be carried out, it should be by people who have been thoroughly trained for it. And do you not think that with time the doctors who turn to analysis will do everything to obtain that training?'

I fear not. So long as the attitude of the medical school to the analytic training institute remains unaltered, doctors will find the temptation to make things easier for themselves too great.

'But you seem to be consistently evading any direct pronouncement on the question of lay analysis. What I guess now is that, because it is impossible to keep a check on doctors who want to analyse, you are proposing, out of revenge, as it were, to punish them by depriving them of their monopoly in analysis and by throwing open this medical activity to laymen as well.'

I cannot say whether you have guessed my motives correctly. Perhaps I shall be able later on to put evidence before you of a less partial attitude. But I lay stress on the demand that *no-one who has not acquired the right to do so by a particular training should practise analysis.* Whether or not such a person is a doctor seems to me immaterial.

[234] 'Then what definite proposals have you to make?'

I have not got so far as that yet; and I cannot tell whether I shall get there at all. I should like to discuss another question with you, and first of all to touch on one special point. It is said that the authorities, at the instigation of the medical profession, want to forbid the practice of analysis by laymen altogether. Such a prohibition would also affect the non-medical members of the psychoanalytical society, who have enjoyed an excellent training and have perfected themselves greatly by practice. If the prohibition were enacted, we should find ourselves in a position in which a number of people are prevented from carrying out an activity which one can safely feel convinced they can perform very well, while the same activity is opened to other people for whom there is no question of a similar guarantee. That is not precisely the sort of result to which legislation should lead. However, this special problem is neither very important nor difficult to solve. Only a handful of people are concerned, who cannot be seriously damaged. They will probably emigrate to Germany where no legislation will prevent them from finding recognition for their proficiency. If it is desired to spare them this and to mitigate the law's severity, that can easily be done on the basis of

some well-known precedents. Under the Austrian monarchy it repeatedly happened that permission was given to notorious quacks, *ad personam* [personally], to carry out medical activities in certain fields, because people were convinced of their real ability. Those concerned were for the most part peasant healers, and their recommendation seems regularly to have been made by one of the archduchesses who were once so numerous; but it ought to be possible for it also to be done in the case of town dwellers and on the basis of a different and merely expert guarantee. Such a prohibition would have more important effects on the Vienna analytic training institute, which would thenceforward be unable to accept any candidates for training from non-medical circles. Thus once again in our country a line of intellectual activity would be suppressed which is allowed to develop freely elsewhere. I am the last person to claim any competence in judging laws and regulations. But this much I can see: that to lay emphasis on our quackery law does not lead in the direction of the approach to conditions in Germany [235]
which is so much aimed at today,[1] and that the application of that law to the case of psychoanalysis has something of an anachronism about it, since at the time of its enactment there was as yet no such thing as analysis and the peculiar nature of neurotic illnesses was not yet recognized.

I come now to a question the discussion of which seems to me more important. Is the practice of psychoanalysis a matter which should in general be subject to official interference, or would it be more expedient to leave it to follow its natural development? I shall certainly not come to any decision on this point here and now, but I shall take the liberty of putting the problem before you for your consideration. In our country from of old a positive *furor prohibendi* [passion for prohibitions] has been the rule, a tendency to keep people under tutelage, to interfere and to forbid, which, as we all know, has not borne particularly good fruit. In our new republican Austria, it seems, things have not yet changed very much. I fancy you will have an important word to say in deciding the case of psychoanalysis which we are now considering; I do not know whether you have the wish or the influence with which to oppose these bureaucratic tendencies. At all events, I shall not spare you my unauthoritative thoughts on the subject. In my opinion a superabundance of regulations and prohibitions injures the authority of the law. It can be observed that where only a few prohibitions exist they are carefully observed, but where one is accompanied by prohibitions at

1 [This of course was in the days of the Weimar Republic.]

every step, one feels definitely tempted to disregard them. Moreover, it does not mean one is quite an anarchist if one is prepared to realize that laws and regulations cannot from their origin claim to possess the attribute of being sacred and untransgressable, that they are often inadequately framed and offend our sense of justice, or will do so after a time, and that, in view of the sluggishness of the authorities, there is often no other means of correcting such inexpedient laws than by boldly violating them. Furthermore, if one desires to maintain respect for laws and regulations it is advisable not to enact any where a watch cannot easily be kept on whether they are obeyed or transgressed. Much of what I have quoted above on the practice of analysis by doctors could
[236] be repeated here in regard to genuine analysis by laymen which the law is seeking to suppress. The course of an analysis is most inconspicuous, it employs neither medicines nor instruments and consists only in talking and an exchange of information; it will not be easy to prove that a layman is practising 'analysis', if he asserts that he is merely giving encouragement and explanations and trying to establish a healthy human influence on people who are in search of mental assistance. It would surely not be possible to forbid that merely because doctors sometimes do the same thing. In English-speaking countries the practices of Christian Science have become very widespread: a kind of dialectical denial [*Verleugnung*] of the evils in life, based on an appeal to the doctrines of the Christian religion. I do not hesitate to assert that that procedure represents a regrettable aberration of the human spirit; but who in America or England would dream of forbidding it and making it punishable? Are the authorities so certain of the right path to salvation that they venture to prevent each man from trying 'to be saved after his own fashion'.[1] And granted that many people if they are left to themselves run into danger and come to grief, would not the authorities do better carefully to mark the limits of the regions which are to be regarded as not to be trespassed upon, and for the rest, so far as possible, to allow human beings to be educated by experience and mutual influence? Psychoanalysis is something so new in the world, the mass of mankind is so little instructed about it, the attitude of official science to it is still so vacillating, that it seems to me over-hasty to intervene in its development with legislative regulations. Let us allow patients themselves to discover that it is damaging to them to look for mental

1 ['*Nach seiner Façon selig zu werden*.' The saying '*In meinem Staate kann jeder nach seiner Façon selig werden*' ('In my State every man can be saved after his own fashion') is attributed to Frederick the Great.]

assistance to people who have not learnt how to give it. If we explain this to them and warn them against it, we shall have spared ourselves the need to forbid it. On the main roads of Italy the pylons that carry high-tension cables bear the brief and impressive inscription: '*Chi tocca, muore* [He who touches will die].' This is perfectly calculated to regulate the behaviour of passers-by to any wires that may be hanging down. The corresponding German notices exhibit an unnecessary and offensive verbosity: '*Das Berühren der Leitungsdrähte ist, weil lebensgefährlich, strengstens verboten* [Touching the transmission cables is, since it is dangerous to life, most strictly prohibited].' Why the prohibition? Anyone who holds his life dear will make the prohibition for himself; and anyone who wants to kill himself in that way will not ask for permission. [237]

'But there are instances that can be quoted as legal precedents against allowing lay analysis; I mean the prohibition against laymen practising hypnotism and the recently enacted prohibition against holding spiritualist séances or founding spiritualist societies.'

I cannot say that I am an admirer of these measures. The second one is a quite undisguised encroachment of police supervision to the detriment of intellectual freedom. I am beyond suspicion of having much belief in what are known as 'occult phenomena' or of feeling any desire that they should be recognized. But prohibitions like these will not stifle people's interest in that supposedly mysterious world. They may on the contrary have done much harm and have closed the door to an impartial curiosity which might have arrived at a judgement that would have set us free from these harassing possibilities. But once again this applies only to Austria. In other countries 'parapsychical' researches are not met by any legal obstacles. The case of hypnotism is somewhat different from that of analysis. Hypnotism is the evoking of an abnormal mental state and is used by laymen today only for the purpose of public shows. If hypnotic therapy had maintained its very promising beginnings, a position would have been arrived at similar to that of analysis. And incidentally the history of hypnotism provides a precedent for that of analysis in another direction. When I was a young lecturer in neuropathology, the doctors inveighed passionately against hypnotism, declared that it was a swindle, a deception of the Devil's and a highly dangerous procedure. Today they have monopolized this same hypnotism and they make use of it unhesitatingly as a method of examination; for some nerve specialists it is still their chief therapeutic instrument.

But I have already told you that I have no intention of making proposals which are based on the decision as to whether legal control or letting things go is to be preferred in the matter of analysis. I know this is a question of principle on the reply to which the inclinations of persons in authority will probably have more influence than arguments. I [238] have already set out what seems to me to speak in favour of a policy of *laissez faire*. If the other decision is taken – for a policy of active intervention – then it seems to me that in any case a lame and unjust measure of ruthlessly forbidding analysis by non-doctors will be an insufficient outcome. More will have to be considered in that case: the conditions will have to be laid down under which the practice of analysis shall be permitted to all those who seek to make use of it, an authority will have to be set up from whom one can learn what analysis is and what sort of preparation is needed for it, and the possibilities for instruction in analysis will have to be encouraged. We must therefore either leave things alone or establish order and clarity; we must not rush into a complicated situation with a single isolated prohibition derived mechanically from a regulation that has become inadequate.

VII

'Yes, but the doctors! the doctors! I cannot induce you to go into the [239]
real subject of our conversations. You still keep on evading me. It is a question of whether we should not give doctors the exclusive right of practising analysis – for all I care, after they have fulfilled certain conditions. The majority of doctors are certainly not quacks in analysis as you have represented them. You say yourself that the great majority of your pupils and followers are doctors. It has come to my ears that they are far from sharing your point of view on the question of lay analysis. I may no doubt assume that your pupils agree with your demands for sufficient preparation and so on; and yet these pupils think it consistent to close the practice of analysis to laymen. Is that so? and if so, how do you explain it?'

I see you are well informed. Yes, it is so. Not all, it is true, but a good proportion of my medical colleagues do not agree with me over this, and are in favour of doctors having an exclusive right to the analytic treatment of neurotics. This will show you that differences of opinion are allowed even in our camp. The side I take is well known and the contradiction on the subject of lay analysis does not interfere with our good understanding. How can I explain the attitude of these pupils of mine to you? I do not know for certain; I think it must be the power of professional feeling. The course of their development has been different from mine, they still feel uncomfortable in their isolation from their colleagues, they would like to be accepted by the 'profession'[1] as having plenary rights, and are prepared, in exchange for that tolerance, to make a sacrifice at a point whose vital importance is not obvious to them. Perhaps it may be otherwise; to impute motives of competition to them would be not only to accuse them of base sentiments but also to attribute a strange short-sightedness to them. They are always ready to introduce other doctors into analysis, and from a material point of view it must be a matter of indifference to them whether they have to share the available patients with medical colleagues or with laymen. But something different probably plays a part. These pupils of mine may be influenced by certain factors which guarantee a doctor an undoubted [240]
advantage over a layman in analytic practice.

1 [The word is in English in the original.]

'Guarantee him an advantage? There we have it. So you are admitting the advantage at last? This should settle the question.'

The admission is not hard for me to make. It may show you that I am not so passionately prejudiced as you suppose. I have put off mentioning these things because their discussion will once again make theoretical considerations necessary.

'What are you thinking of now?'

First there is the question of diagnosis. When one takes into analysis a patient suffering from what are described as nervous disorders, one wishes beforehand to be certain – so far, of course, as certainty can be attained – that he is suited for this kind of treatment, that one can help him, that is to say, by this method. That, however, is only the case if he really has a neurosis.

'I should have thought that would be recognizable from the phenomena, the symptoms, of which he complains.'

This is where a fresh complication arises. It cannot always be recognized with complete certainty. The patient may exhibit the external picture of a neurosis, and yet it may be something else – the beginning of an incurable mental disease or the preliminary of a destructive process in the brain. The distinction – the differential diagnosis – is not always easy and cannot be made immediately in every phase. The responsibility for such a decision can of course only be undertaken by a doctor. As I have said, it is not always easy for him. The illness may have an innocent appearance for a considerable time, till in the end it after all displays its evil character. Indeed, it is one of the regular fears of neurotics that they may become insane. However, if a doctor has been mistaken for a time over a case of this sort or has been in uncertainty about it, no harm has been caused and nothing unnecessary has been done. Nor indeed would the analytic treatment of this case have done any harm, though it would have been exposed as an unnecessary waste. And, moreover, there would certainly be enough people who would blame the analysis for the unfortunate outcome. Unjustly, no doubt, but such occasions ought to be avoided.

[241] 'But that sounds hopeless. It strikes at the roots of everything you have told me about the nature and origin of a neurosis.'

Not at all. It merely confirms once again the fact that neurotics are a nuisance and an embarrassment for all concerned – including the analysts. But perhaps I shall clear up your confusion if I state my new information in more correct terms. It would probably be more correct to say of the cases we are now dealing with that they have really

developed a neurosis, but that it is not psychogenic but somatogenic – that its causes are not mental but physical. Do you understand?

'Oh, yes, I understand. But I cannot bring it into harmony with the other side, the psychological one.'

That can be managed, though, if one bears in mind the complexities of living substance. In what did we find the essence of a neurosis? In the fact that the ego, the higher organization of the mental apparatus (elevated through the influence of the external world), is not able to fulfil its function of mediating between the id and reality, that in its feebleness it draws back from some drive portions of the id and, to make up for this, has to put up with the consequences of its renunciation in the form of restrictions, symptoms and unsuccessful reaction-formations.

A feebleness of the ego of this sort is to be found in all of us in childhood; and that is why the experiences of the earliest years of childhood are of such great importance for later life. Under the extraordinary burden of this period of childhood – we have in a few years to cover the enormous developmental distance between stone-age primitive men and the participants in contemporary civilization, and, at the same time and in particular, we have to fend off the drive impulses of the early sexual period – under this burden, then, our ego takes refuge in repression and lays itself open to an infantile neurosis, the precipitate of which it carries with it into maturity as a disposition to a later nervous illness. Everything now depends on how the growing organism is treated by fate [*Schicksal*]. If life becomes too hard, if the gulf between drive claims and the demands of reality becomes too great, the ego may fail in its efforts to reconcile the two, and the more readily, the more it is inhibited by the disposition carried over by it from infancy. The process of repression is then repeated, the drives tear themselves away from the [242] ego's domination, find their substitutive satisfactions along the paths of regression, and the poor ego has become helplessly neurotic.

Only let us hold fast to this: the nodal point and pivot of the whole situation is the relative strength of the ego organization. We shall then find it easy to complete our aetiological survey. As what may be called the normal causes of neurotic illness we already know the feebleness of the childhood ego, the task of dealing with the early sexual impulses and the effects of the more or less chance experiences of childhood. Is it not possible, however, that yet other factors play a part, derived from the time before the beginning of the child's life? For instance, an innate strength and unruliness of the life of the drives in the id, which from the outset sets the ego tasks too hard for it? Or a special developmental

feebleness of the ego due to unknown reasons? Such factors must of course acquire an aetiological importance, in some cases a transcendent one. We have invariably to reckon with the drive strength of the id; if it has developed to excess, the prospects of our therapy are poor. We still know too little of the causes of a developmental inhibition of the ego. These then would be the cases of neurosis with an essentially constitutional basis. Without some such constitutional, congenital favouring factors a neurosis can, no doubt, scarcely come about.

But if the relative feebleness of the ego is the decisive factor for the genesis of a neurosis, it must also be possible for a later physical illness to produce a neurosis, provided that it can bring about an enfeeblement of the ego. And that, once again, is very frequently found. A physical disorder of this kind can affect the life of the drives in the id and increase the strength of the drives beyond the limit up to which the ego is capable of coping with them. The normal model of such processes is perhaps the alteration in women caused by the disturbances of menstruation and the menopause. Or again, a general somatic illness, indeed an organic disease of the nervous central organ, may attack the nutritional conditions of the mental apparatus and compel it to reduce its functioning and to bring to a halt its more delicate workings, one of which is the maintenance of the ego organization. In all these cases approximately the same picture of neurosis emerges; neurosis always has the same
[243] psychological mechanism, but, as we see, a most varied and often very complex aetiology.

'You please me better now. You have begun talking like a doctor at last. And now I expect you to admit that such a complicated medical affair as a neurosis can only be handled by a doctor.'

I fear you are overshooting the mark. What we have been discussing was a piece of pathology, what we are concerned with in analysis is a therapeutic procedure. I allow – no, I insist – that in every case which is under consideration for analysis the diagnosis shall be established first by a doctor. Far the greater number of neuroses which occupy us are fortunately of a psychogenic nature and give no grounds for pathological suspicions. Once the doctor has established this, he can confidently hand over the treatment to a lay analyst. In our analytical societies matters have always been arranged in that way. Thanks to the intimate contact between medical and non-medical members, mistakes such as might be feared have been as good as completely avoided. There is a further contingency, again, in which the analyst has to ask the doctor's help. In the course of an analytic treatment, symptoms – most often

physical symptoms – may appear about which one is doubtful whether they should be regarded as belonging to the neurosis or whether they should be related to an independent organic illness that has intervened. The decision on this point must once again be left to a doctor.

'So that even during the course of an analysis a lay analyst cannot do without a doctor. A fresh argument against their fitness.'

No. No argument against lay analysts can be manufactured out of this possibility, for in such circumstances a medical analyst would not act differently.

'I do not understand that.'

There is a technical rule that an analyst, if dubious symptoms like this emerge during the treatment, shall not submit them to his own judgement but shall get them reported upon by a doctor who is not connected with analysis – a consultant physician, perhaps – even if the analyst himself is a doctor and still well versed in his medical knowledge.

'And why should a rule be made that seems to me so uncalled for?'

It is not uncalled for; in fact, there are several reasons for it. In the [244]
first place it is not a good plan for a combination of organic and psychical treatment to be carried out by one and the same person. Secondly the relation in the transference may make it inadvisable for the analyst to examine the patient physically. And thirdly the analyst has every reason for doubting whether he is unprejudiced, since his interests are directed so intensely to the psychical factors.

'I now understand your attitude to lay analysis quite clearly. You are determined that there must be lay analysts. And since you cannot dispute their inadequacy for their task, you are scraping together everything you can to excuse them and make their existence easier. But I cannot in the least see why there should be lay analysts, who, after all, can only be therapists of the second class. I am ready, so far as I am concerned, to make an exception in the case of the few laymen who have already been trained as analysts; but no fresh ones should be created and the training institutes should be put under an obligation to take no more laymen into training.'

I am at one with you, if it can be shown that all the interests involved will be served by this restriction. You will agree that these interests are of three sorts: that of the patients, that of the doctors and – last not least[1] – that of science, which indeed comprises the interests of all future patients. Shall we examine these three points together?

For the patient, then, it is a matter of indifference whether or not the

1 [In English in the original.]

analyst is a doctor, provided only that the danger of his condition being misunderstood is excluded by the necessary medical report before the treatment begins and on some possible occasions during the course of it. For him it is incomparably more important that the analyst should possess personal qualities that make him trustworthy, and that he should have acquired the knowledge and understanding as well as the experience which alone can make it possible for him to fulfil his task. It might be thought that it would damage an analyst's authority if the patient knows that he is not a doctor and cannot in some situations do without a doctor's support. We have, of course, never omitted to inform patients of their analyst's qualification, and we have been able to convince ourselves that professional prejudices find no echo in them and [245] that they are ready to accept a cure from whatever direction it is offered them – which, incidentally, the medical profession discovered long ago to its deep mortification. Nor are the lay analysts who practise analysis today any chance collection of riff-raff, but people of academic education, doctors of philosophy, educationalists, together with a few women of great experience in life and outstanding personality. The analysis, to which all the candidates in an analytic training institute have to submit, is at the same time the best means of forming an opinion of their personal aptitude for carrying out their exacting occupation.

Now as to the interest of the doctors. I cannot think that it would gain by the incorporation of psychoanalysis into medicine. The medical curriculum already lasts for five years and the final examinations extend well into a sixth year. Every few years fresh demands are made on the student, without the fulfilment of which his equipment for the future would have to be declared insufficient. Access to the medical profession is very difficult and its practice neither very satisfying nor very remunerative. If one supports what is certainly a fully justified demand that doctors should also be familiar with the mental side of illness, and if on that account one extends medical education to include some preparation for analysis, that implies a further increase in the curriculum and a corresponding prolongation of the period of study. I do not know whether the doctors will be pleased by this consequence of their claim upon analysis. But it can scarcely be escaped. And this at a period in which the conditions of material existence have so greatly deteriorated for the classes from which doctors are recruited, a period in which the younger generation sees itself compelled to make itself self-supporting as early in life as possible.

But perhaps you will choose not to burden medical studies with the

preparation for analytic practice but think it more expedient for future analysts to take up their necessary training only after the end of their medical studies. You may say the loss of time involved in this is of no practical account, since after all a young man of less than thirty will never enjoy his patients' confidence, which is a *sine qua non* of giving mental assistance. It might no doubt be said in reply that a newly fledged physician for physical illnesses cannot count upon being treated by his [246] patients with very great respect either, and that a young analyst might very well fill in his time by working in a psychoanalytic out-patient clinic under the supervision of experienced practitioners.

But what seems to me more important is that with this proposal of yours you are giving support to a waste of energy for which, in these difficult times, I can really find no economic justification. Analytic training, it is true, cuts across the field of medical education, but neither includes the other. If – which may sound fantastic today – one had to found a college of psychoanalysis, much would have to be taught in it which is also taught by the medical faculty: alongside of depth psychology, which would always remain the principal subject, there would be an introduction to biology, as much as possible of the science of sexual life, and familiarity with the symptomatology of psychiatry. On the other hand, analytic instruction would include branches of knowledge which are remote from medicine and which the doctor does not come across in his practice: the history of civilization, mythology, the psychology of religion and the science of literature. Unless he is well at home in these subjects, an analyst can make nothing of a large amount of his material. By way of compensation, the great mass of what is taught in medical schools is of no use to him for his purposes. A knowledge of the anatomy of the tarsal bones, of the constitution of the carbohydrates, of the course of the cranial nerves, a grasp of all that medicine has brought to light on bacillary exciting causes of disease and the means of combating them, on serum reactions and on neoplasms – all of this knowledge, which is undoubtedly of the highest value in itself, is nevertheless of no consequence to him; it does not concern him; it neither helps him directly to understand a neurosis and to cure it nor does it contribute to a sharpening of those intellectual capacities on which his occupation makes the greatest demands. It cannot be objected that the case is much the same when a doctor takes up some other special branch of medicine – dentistry, for instance: in that case, too, he may not need some of what he has to pass examinations in, and he will have to learn much in addition, for which his schooling has not

prepared him. But the two cases cannot be put on a par. In dentistry
[247] the great principles of pathology – the theories of inflammation, suppuration, necrosis, and of the metabolism of the bodily organs – still retain their importance. But the experience of an analyst lies in another world, with other phenomena and other laws. However much philosophy may ignore the gulf between the physical and the mental, it still exists for our immediate experience and still more for our practical endeavours.

It is unjust and inexpedient to try to compel a person who wants to set someone else free from the torment of a phobia or an obsession to take the roundabout road of the medical curriculum. Nor will such an endeavour have any success, unless it results in suppressing analysis entirely. Imagine a landscape in which two paths lead to a hilltop with a view – one short and straight, the other long, winding and circuitous. You try to stop up the short path by a prohibitory notice, perhaps because it passes by some flower-beds that you want to protect. The only chance you have of your prohibition being respected is if the short path is steep and difficult while the longer one leads gently up. If, however, that is not so, and the roundabout path is on the contrary the harder, you may imagine the use of your prohibition and the fate of your flower-beds! I fear you will succeed in compelling the laymen to study medicine just as little as I shall be able to induce doctors to learn analysis. For you know human nature as well as I do.

'If you are right, that analytic treatment cannot be carried out without special training, but that the medical curriculum cannot bear the further burden of a preparation for it, and that medical knowledge is to a great extent unnecessary for an analyst, how shall we achieve the ideal physician who shall be equal to all the tasks of his calling?'

I cannot foresee the way out of these difficulties, nor is it my business to point it out. I see only two things, first that analysis is an embarrassment to you and that the best thing would be for it not to exist – though neurotics, no doubt, are an embarrassment too; and secondly, that the interests of everyone concerned would for the time being be met if the doctors could make up their minds to tolerate a class of therapists which would relieve them of the tedium of treating the enormously common psychogenic neuroses while remaining in constant touch with them to the benefit of the patients.

[248] 'Is that your last word on the subject? or have you something more to say?'

Yes indeed. I wanted to bring up a third interest – the interest of

science. What I have to say about that will concern you little; but, by comparison, it is of all the more importance to me.

For we do not consider it at all desirable for psychoanalysis to be swallowed up by medicine and to find its last resting place in a textbook of psychiatry under the heading 'Methods of Treatment', alongside of procedures such as hypnotic suggestion, autosuggestion and persuasion, which, born from our ignorance, have to thank the laziness and cowardice of mankind for their shortlived effects. It deserves a better fate and, it may be hoped, will meet with one. As a 'depth psychology', a theory of the mental unconscious, it can become indispensable to all the sciences which are concerned with the evolution of human civilization and its major institutions such as art, religion and the social order. It has already, in my opinion, afforded these sciences considerable help in solving their problems. But these are only small contributions compared with what might be achieved if historians of civilization, psychologists of religion, philologists and so on would agree themselves to handle the new instrument of research which is at their service. The use of analysis for the treatment of the neuroses is only one of its applications; the future will perhaps show that it is not the most important one. In any case it would be wrong to sacrifice all the other applications to this single one, just because it touches on the circle of medical interests.

For here a further prospect stretches ahead, which cannot be encroached upon with impunity. If the representatives of the various human sciences [*Geisteswissenschaften*][1] are to study psychoanalysis so as to be able to apply its methods and angles of approach to their own material, it will not be enough for them to stop short at the findings which are laid down in analytic literature. They must learn to understand analysis in the only way that is possible – by themselves undergoing an analysis. The neurotics who need analysis would thus be joined by a second class of persons, who accept analysis from intellectual motives, but who will no doubt also welcome the increase in their capacities which they will incidentally achieve. To carry out these analyses a number of analysts will be needed, for whom any medical [249] knowledge will have particularly little importance. But these 'teaching analysts' – let us call them – will need to have had a particularly careful education. If this is not to be stunted, they must be given an opportunity of collecting experience from instructive and informative cases; and since healthy people who also lack the motive of curiosity do not present themselves for analysis, it is once more only upon neurotics that it

1 [The term is roughly equivalent to the 'Humanities'.]

will be possible for the teaching analysts – under careful supervision – to be educated for their subsequent non-medical activity. All this, however, requires a certain amount of freedom of movement, and is not compatible with petty restrictions.

Perhaps you do not believe in these purely theoretical interests of psychoanalysis or cannot allow them to affect the practical question of lay analysis. Then let me advise you that psychoanalysis has yet another sphere of application, which is outside the scope of the quackery law and to which the doctors will scarcely lay claim. Its application, I mean, to the bringing up of children. If a child begins to show signs of an undesirable development, if it grows moody, refractory and inattentive, the paediatrician and even the school doctor can do nothing for it, even if the child produces clear neurotic symptoms, such as nervousness, loss of appetite, vomiting or insomnia. A treatment that combines analytic influence with educational measures, carried out by people who are not ashamed to concern themselves with the affairs in a child's world, and who understand how to find their way into a child's mental life, can bring about two things at once: the removal of the neurotic symptoms and the reversal of the change in character which had begun. Our recognition of the importance of these inconspicuous neuroses of children as laying down the disposition for serious illnesses in later life points to these child analyses as an excellent method of prophylaxis. Analysis undeniably still has its enemies. I do not know whether they have means at their command for stopping the activities of these educational analysts or analytic educationalists. I do not think it very likely; but one can never feel too secure.

Moreover, to return to our question of the analytic treatment of adult neurotics, even there we have not yet exhausted every line of approach.
[250] Our civilization imposes an almost intolerable pressure on us and it calls for a corrective. Is it too fantastic to expect that psychoanalysis in spite of its difficulties may be destined to the task of preparing mankind for such a corrective? Perhaps once more an American may hit on the idea of spending a little money to get the 'social workers'[1] of his country trained analytically and to turn them into a band of helpers for combating the neuroses of civilization.

'Aha! a new kind of Salvation Army!'

Why not? Our imagination always follows patterns. The stream of eager learners who will then flow to Europe will be obliged to pass Vienna by, for here the development of analysis may have succumbed

1 [In English in the original.]

to a premature trauma of prohibition. You smile? I am not saying this as a bribe for your support. Not in the least. I know you do not believe me; nor can I guarantee that it will happen. But one thing I do know. It is by no means so important what decision you give on the question of lay analysis. It may have a local effect. But the things that really matter – the possibilities in psychoanalysis for *internal* development – can never be affected by regulations and prohibitions.

POSTSCRIPT

(1927)

[251] The immediate occasion of my writing the small volume which was the starting point of the present discussion was a charge of quackery brought against a non-medical member of our Society, Dr Theodor Reik, in the Vienna courts. It is generally known, I think, that after all the preliminary proceedings had been completed and a number of expert opinions had been received, the charge was dropped. I do not believe that this was a result of my book. No doubt the prosecution's case was too weak, and the person who brought the charge as an aggrieved party proved an untrustworthy witness. So that the quashing of the proceedings against Dr Reik is probably not to be regarded as a considered judgment of the Vienna courts on the general question of lay analysis. When I drew the figure of the 'Impartial Person' who was my interlocutor in my tract, I had before my mind one of our high officials. This was a man with a friendly attitude and a mind of unusual integrity, to whom I had myself talked about Reik's case and for whom I had, at his request, written a confidential opinion on the subject.[1] I knew I had not succeeded in converting him to my views, and that was why I made my dialogue with the Impartial Person end without agreement too.

Nor did I expect that I should succeed in bringing about unanimity in the attitude of analysts themselves towards the problem of lay analysis. Anyone who compares the views expressed by the Hungarian Society in this discussion[2] with those of the New York group will perhaps conclude that my book has produced no effect whatever and that everyone persists in his former opinion. But I do not believe this either. I think that many of my colleagues have modified their extreme *parti pris* and that the majority have accepted my view that the problem of lay analysis ought not to be decided along the lines of traditional usage but that it

1 [Cf. the Editors' Note, p. 160 above.]

2 [I.e. the discussion of Freud's views by twenty-eight international colleagues, published in the two journals in which this Postscript was published as the concluding comment. See the Editors' Note, p. 160 above.]

arises from a novel situation and therefore demands a fresh judgement.

Again, the turn which I gave to the whole discussion seems to have met with approval. My main thesis was that the important question is [252] not whether an analyst possesses a medical diploma but whether he has had the special training necessary for the practice of analysis. This served as the starting point for a discussion, which was eagerly embarked upon, as to what is the training most suitable for an analyst. My own view was and still remains that it is not the training prescribed by the university for future doctors. What is known as medical education appears to me to be an arduous and circuitous way of approaching the profession of analysis. No doubt it offers an analyst much that is indispensable to him. But it burdens him with too much else of which he can never make use, and there is a danger of its diverting his interest and his whole mode of thought from the understanding of psychical phenomena. A scheme of training for analysts has still to be created. It must include elements from the human sciences, from psychology, the history of civilization and sociology, as well as from anatomy, biology and the study of evolution. There is so much to be taught in all this that it is justifiable to omit from the curriculum anything which has no direct bearing on the practice of analysis and serves only indirectly (like any other study) as a training for the intellect and for the powers of observation. It is easy to meet this suggestion by objecting that analytic colleges of this kind do not exist and that I am merely setting up an ideal. An ideal, no doubt. But an ideal which can and must be realized. And in our training institutes, in spite of all their youthful insufficiencies, that realization has already begun.

It will not have escaped my readers that in what I have said I have assumed as axiomatic [*selbstverständlich*][t] something that is still violently disputed in the discussion. I have assumed, that is to say, that psychoanalysis is not a specialized branch of medicine. I cannot see how it is possible to dispute this. Psychoanalysis is a part of psychology; not of medical psychology in the old sense, not of the psychology of morbid processes, but simply of psychology. It is certainly not the whole of psychology, but its substructure and perhaps even its entire foundation. The possibility of its application to medical purposes must not lead us astray. Electricity and X-rays also have their medical application, but the science to which they both belong is nonetheless physics. Nor can their situation be affected by historical arguments. The whole theory of electricity had its origin in an observation of a neuromuscular preparation; [253]

yet no-one would dream today of regarding it as a part of physiology. It is argued that psychoanalysis was after all discovered by a physician in the course of his efforts to assist his patients. But that is clearly neither here nor there. Moreover, the historical argument is double-edged. We might pursue the story and recall the unfriendliness and indeed the animosity with which the medical profession treated analysis from the very first. That would seem to imply that it can have no claims over analysis today. And though I do not accept that implication, I still feel some doubts as to whether the present wooing of psychoanalysis by the doctors is based, from the point of view of the libido theory, upon the first or upon the second of Abraham's [anal-sadistic] substages[1] – whether they wish to take possession of their object for the purpose of destroying or of preserving it.

I should like to consider the historical argument a moment longer. Since it is with me personally that we are concerned, I can throw a little light, for anyone who may be interested, on my own motives. After forty-one years of medical activity, my self-knowledge tells me that I have never really been a doctor in the proper sense. I became a doctor through being compelled to deviate from my original purpose; and the triumph of my life lies in my having, after a long and roundabout journey, found my way back to my earliest path. I have no knowledge of having had any craving in my early childhood to help suffering humanity. My innate sadistic disposition was not a very strong one, so that I had no need to develop this one of its derivatives. Nor did I ever play the 'doctor game'; my infantile curiosity evidently chose other paths. In my youth I felt an overpowering need to understand something of the riddles of the world in which we live and perhaps even to contribute something to their solution. The most hopeful means of achieving this end seemed to be to enrol myself in the medical faculty; but even after that I experimented – unsuccessfully – with zoology and chemistry, till at last, under the influence of Brücke, who carried more weight with me than anyone else in my whole life, I settled down to physiology, though in those days it was too narrowly restricted to histology. By that time I [254] had already passed all my medical examinations; but I took no interest in anything to do with medicine till the teacher whom I so deeply respected warned me that in view of my impoverished material circumstances I could not possibly take up a theoretical career. Thus I passed

1 [Cf. Abraham (1924), English translation, 1927, 450 f. See also Lecture XXXII in the *New Introductory Lectures* (1933*a*), *RSE*, **22**, 87–8.]

from the histology of the nervous system to neuropathology[1] and then, prompted by fresh influences, I began to be concerned with the neuroses. I scarcely think, however, that my lack of a genuine medical temperament has done much damage to my patients. For it is not greatly to the advantage of patients if their doctor's therapeutic interest has too marked an emotional emphasis. They are best helped if he carries out his task coolly and keeping as closely as possible to the rules [*möglichst korrekt*][t].

No doubt what I have just said throws little light on the problem of lay analysis; it was intended only to exhibit my personal credentials as being myself a supporter of the inherent value of psychoanalysis and of its independence of its application to medicine. But it will be objected at this point that whether psychoanalysis, regarded as a science, is a subdivision of medicine or of psychology is a purely academic question and of no practical interest. The real point at issue, it will be said, is a different one, namely the application of analysis to the treatment of patients; insofar as it claims to do this it must be content, the argument will run, to be accepted as a specialized branch of medicine, like radiology, for instance, and to submit to the rules laid down for all therapeutic methods. I recognize that that is so; I admit it. I want only to feel assured that the therapy will not destroy the science. Unluckily analogies never carry one more than a certain distance; a point is soon reached at which the subjects of the comparison take divergent paths. The case of analysis differs from that of radiology. A physicist does not need to have a patient in order to study the laws that govern X-rays. But the only subject matter of psychoanalysis is the mental processes of human beings and it is only in human beings that it can be studied. For reasons which can easily be understood, neurotic human beings offer far more instructive and accessible material than normal ones, and to withhold that material from anyone who wishes to study and apply analysis is to dock him of a good half of his training possibilities. I have, of course, no intention of asking that the interests of neurotic patients should be sacrificed to those of instruction and scientific research. The aim of my small volume on the question of lay analysis was precisely to show that, if certain [255]
precautions are observed, the two interests can quite easily be brought into harmony and that the interests of medicine, as rightly understood, will not be the last to profit by such a solution.

I myself brought forward all the necessary precautions and I can safely say that the discussion added nothing on this point. But I should like to

1 [I.e. clinical neurology.]

remark that the emphasis was often placed in a manner which did not do justice to the facts. What was said about the difficulties of differential diagnosis and the uncertainty in many cases in deciding about somatic symptoms – situations, that is, in which medical knowledge and medical intervention are necessary – this is all of it perfectly true. Nevertheless, the number of cases in which doubts of this kind never arise at all and in which a doctor is *not* required is surely incomparably greater. These cases may be quite uninteresting scientifically, but they play an important enough part in life to justify the activity of lay analysts, who are perfectly competent to deal with them. Some time ago I analysed a colleague who gave evidence of a particularly strong dislike of the idea of anyone who was not himself a medical man being allowed to engage in a medical activity. I was in a position to say to him: 'We have now been working for more than three months. At what point in our analysis have I had occasion to make use of my medical knowledge?' He admitted that I had had no such occasion.

Again, I attach no great importance to the argument that a lay analyst, because he must be prepared to consult a doctor, will have no authority in the eyes of his patients and will be treated with no more respect than such people as bone-setters or masseurs. Once again, the analogy is an imperfect one – quite apart from the fact that what governs patients in their recognition of authority is usually their emotional transference and that the possession of a medical diploma does not impress them nearly so much as doctors believe. A professional lay analyst will have no difficulty in winning as much respect as is due to a secular pastoral worker.[1] Indeed, the words 'secular pastoral worker' might well serve
[256] as a general formula for describing the function which the analyst, whether he is a doctor or a layman, has to perform in his relation to the public. Our friends among the Protestant clergy, and more recently among the Catholic clergy as well, are often able to relieve their parishioners of the inhibitions of their daily life by confirming their faith – after having first offered them a little analytic information about the nature of their conflicts. Our opponents, the Adlerian 'individual psychologists', endeavour to produce a similar result in people who have become unstable and inefficient by arousing their interest in the social community – after having first thrown some light upon a single corner of their mental life and shown them the part played in their illness by their egoistic [*egoistischen*] and distrustful impulses. Both of these

1 ['*Seelsorger*.' Freud had already referred to the work performed in this capacity in Protestant countries in his Introduction to a book of Pfister's (1913*b*), *RSE*, **12**, 328–9.]

procedures, which derive their power from being based on analysis, have their place in psychotherapy. We who are analysts set before us as our aim the most complete and profoundest possible analysis of whoever may be our patient. We do not seek to bring him relief by receiving him into the Catholic, Protestant or socialist community. We seek rather to enrich him from his own internal sources, by putting at the disposal of his ego those energies which, owing to repression, are inaccessibly confined in his unconscious, as well as those which his ego is obliged to squander in the fruitless task of maintaining these repressions. Such activity as this is pastoral work in the best sense of the words. Have we set ourselves too high an aim? Are the majority of our patients worth the pains that this work requires of us? Would it not be more economical to prop up their weaknesses from without rather than to rebuild them from within? I cannot say; but there is something else that I *do* know. In psychoanalysis there has existed from the very first an inseparable bond between cure and research. Knowledge brought therapeutic success. It was impossible to treat a patient without learning something new; it was impossible to gain fresh insight without perceiving its beneficent results. Our analytic procedure is the only one in which this precious conjunction is assured. It is only by carrying on our analytic pastoral work that we can deepen our dawning comprehension of the human mind. This prospect of scientific gain has been the proudest and happiest feature of analytic work. Are we to sacrifice it for the sake of any considerations of a practical sort?

Some remarks that have been made in the course of this discussion [257]
have led me to suspect that, in spite of everything, my book on lay analysis has been misunderstood in one respect. The doctors have been defended against me, as though I had declared that they were in general incompetent to practise analysis and as though I had given it out as a password that medical reinforcements were to be rejected. That was not my intention. The idea probably arose from my having been led to declare in the course of my observations (which had a controversial end in view) that untrained medical analysts were even more dangerous than laymen. I might make my true opinion on this question clear by echoing a cynical remark about women that once appeared in *Simplicissimus*. One man was complaining to another about the weaknesses and troublesome nature of the fair sex. 'All the same,' replied his companion, 'women are the best thing we have of the kind.' I am bound to admit that, so long as schools such as we desire for the training of analysts are not yet in existence, people who have had a preliminary education in

medicine are the best material for future analysts. We have a right to demand, however, that they should not mistake their preliminary education for a complete training, that they should overcome the one-sidedness that is fostered by instruction in medical schools and that they should resist the temptation to flirt with endocrinology and the autonomic nervous system, where what is needed is an apprehension of psychological facts with the help of a framework of psychological concepts. I also share the view that all those problems which relate to the connection between psychical phenomena and their organic, anatomical and chemical foundations can be approached only by those who have studied both, that is, by medical analysts. It should not be forgotten, however, that this is not the whole of psychoanalysis, and that for its other aspect we can never do without the cooperation of people who have had a preliminary education in the *human* sciences.[1] For practical reasons we have been in the habit – and this is true, incidentally, of our publications as well – of distinguishing between medical and applied analysis. But that is not a logical distinction. The true line of division is between *scientific* analysis and its *applications* alike in medical and in non-medical fields.

[258] In these discussions the bluntest rejection of lay analysis has been expressed by our American colleagues. A few words to them in reply will, I think, not be out of place. I can scarcely be accused of making a misuse of analysis for controversial purposes if I express an opinion that their resistance is derived wholly from practical factors. They see how in their own country lay analysts put analysis to all kinds of mischievous and illegitimate purposes and in consequence cause injury both to their patients and to the good name of analysis. It is therefore not to be wondered at if in their indignation they give the widest possible berth to such unscrupulous mischief-makers and try to prevent any laymen from having a share in analysis. But these facts are already enough to diminish the significance of the American position; for the question of lay analysis must not be decided on practical considerations alone, and local conditions in America cannot be the sole determining influence on our views.[2]

The resolution passed by our American colleagues against lay analysts, based as it essentially is upon practical reasons, appears to me nevertheless to be unpractical; for it cannot affect any of the factors

1 [*Geisteswissenschaften*. See Editors' footnote 2, p. 50 above.]

2 [Six paragraphs that appear at this point in the original manuscript (see Grubrich-Simitis, 1993, 225–9; trans., 177–80) were deleted in the published version. The missing text is reproduced in Appendix A below.]

which govern the situation. It is more or less equivalent to an attempt at repression. If it is impossible to prevent the lay analysts from pursuing their activities and if the public does not support the campaign against them, would it not be more expedient to recognize the fact of their existence by offering them opportunities for training? Might it not be possible in this way to gain some influence over them? And, if they were offered as an inducement the possibility of receiving the approval of the medical profession and of being invited to cooperate, might they not have some interest in raising their own ethical and intellectual level?

VIENNA, *June*, 1927

APPENDIX A

SUPPRESSED PORTION OF THE 1927 POSTSCRIPT (1993 [1927])

We owe to Ilse Grubrich-Simitis (1993, 225–9), who carefully compared the manuscript fair copy with the printed text, the rediscovery of the following portion of the 1927 Postscript to *The Question of Lay Analysis*. It was omitted from the published version at the behest of Ernest Jones and Max Eitingon. According to Jones (1957, 316–17) Freud authorized Eitingon (then President of the IPA) 'to omit some sharp remarks about the Americans if he found them not politic or dangerous', in view of the possibility that the Americans 'might seize the excuse to secede'. After consulting with Jones, Eitingon decided to delete the six paragraphs printed below. (Jones later remembered them as being just three sentences; see Jones, 1957, 317.) In the original manuscript (where it is not deleted, but its beginning and end are marked) the passage in question preceded the final paragraph of the Postscript, in which Freud discusses an American resolution against lay analysis.

The missing passage was first published in Grubrich-Simitis's (1993) book, *Zurück zu Freuds Texten*, Frankfurt: S. Fischer Verlag, pp. 226–9. A translation by Philip Slotkin appeared in the English edition of the same book, *Back to Freud's Texts*, New Haven: Yale University Press (1996), pp. 177–80. The present translation is by Mark Solms.

[. . .] However, the attitude of the Americans seems to be open to criticism precisely from the standpoint of expedience. Let us consider the question: to what are we to attribute the rampant growth of harmful lay analysis[1] just in America? To the extent that it is possible to judge from afar, numerous factors seem to combine here, the relative importance of which I am, though, not in a position to determine. First of all, it must be assumed that the medical analysts have succeeded in an unusually limited degree to win the respect of the public and to gain influence over its decisions. Several factors may bear responsibility for this: the expansiveness of the country, the lack of an overarching organization extending beyond the delimited cities, and also the way Americans shrink from authority – their inclination to exercise personal independence in those few areas which have not yet been appropriated [*besetzt*]

1 ['*schädlichen Laienanalyse*.' The phrase is translated literally here but seems to be equivalent to what Freud normally termed 'wild analysis'.]

by the relentless pressure of 'public opinion'.[1] The same American trait, transferred from political life into the scientific arena, is expressed in the analytical group itself through a regulation to the effect that the person of the President must change every year, so that he cannot establish the real leadership that is certainly required in such difficult matters. It is likewise evident in the attitude of scientific circles which, for example, bring the same degree of interest to bear on all varieties of doctrine called psychoanalytic, and then boast that this is proof of their 'openmindedness'.[2] The sceptical European cannot suppress the suspicion that this interest never penetrates too deeply, and that concealed behind the impartiality lies considerable reluctance and incapacity to form judgements.

From everything one hears it seems that sections of the population who fall victim to exploitation by the fraudulent lay analysts in America would be protected from this risk in Europe, even if only by their prejudices. I cannot say what feature of the American mentality is to blame for this, and how it happens that people – whose highest ideal is after all 'efficiency',[3] competence in life – fail to take the simplest precautions when seeking help for their mental troubles. Justice demands, however, that we also should not pass over what can be said in at least partial exoneration of the perpetrators. In wealthy America, where money is readily available for every extravagance, there is still no institution where either doctors or non-doctors can receive instruction in analysis. Impoverished Europe has already established three training institutes – from private funds – in Berlin, Vienna and London. Therefore the poor robbers have no alternative but to pick up the little wisdom with which they must, after all, equip themselves from a pitiful popular account of analysis that one of their compatriots has put together. The good books in English are after all too difficult for them, and the German ones are inaccessible. Then, after they have earned something from their years of piracy, some of these people come to Europe with belated conscientiousness to have their relationship to psychoanalysis retroactively [*nachträglich*] legitimized, to make honest men of themselves and to learn something. Our American colleagues usually are not at all pleased that we do not turn these guests away.

But they also reject those laymen who have sought instruction at one of our training institutes without making any prior misuse of analysis,

1 [In English in the original.]

2 [In English in the original.]

3 [In English in the original.]

and they sharply criticize the limited benefits that these eager students bring home to America. When they are justified in this criticism it is not our fault but rather the consequence of two well-known idiosyncrasies of the American character, to which I merely allude here. First, it is indisputable that the level of general education and of intellectual receptiveness is far lower than in Europe, even in people who have attended an American college. Anyone who does not believe this, or considers it defamation, may independently consider the evidence provided by honest American observers such as the examples in Martin [1920], *The Behavior of Crowds*. Second, one is merely following proverbial wisdom if one recalls that the American never has enough time. Time is indeed money,[1] but it is not altogether clear why it must be converted into money so hastily. It still retains its monetary value when it passes more slowly; and one could say that the more time one invests at the outset, the more money one will ultimately make. In the Alpine districts of Austria a common salutation when two acquaintances meet or part is '*Zeit lassen*' ['take your time']. This phrase has been the subject of much mirth, but in view of the American haste we have come to understand how much worldly wisdom it contains. And yet the American always lacks time. He worships large numbers, the enlargement of all dimensions, but also the cutting of time to an absolute minimum. I believe this is called a 'record'. He therefore wants to learn analysis in three or four months, and analytical treatments should of course last no longer. A European analyst, Otto Rank, has already put himself at the disposal of this American compulsion to abbreviate everything and has adapted his technique to it (this consists in the abreaction of the trauma of birth), and he tries to give his behaviour a theoretical foundation in 'Genetic Psychology' [Rank, 1927]. We are familiar with the way in which every practical need produces a corresponding ideology.

However, psychical processes between the conscious and the unconscious have their own temporal requirements, which fit badly with American demands. It is impossible to transform a person who has hitherto understood nothing about analysis into a competent analyst in three or four months; it is even less possible to bring about in a neurotic, in a similarly brief period of time, the requisite changes to restore his lost capacity for work and enjoyment. So the American achieves nothing at our training institutes, too, because as a rule he stays there for too short a time. Incidentally, I have actually heard of a few laymen from America who completed the entire two-year course of instruction

1 ['Time' and 'money' in English in the original.]

which is prescribed at our training institutes for our own medical candidates, but I have not yet heard of a single American doctor who has taken so much time. No, I must correct myself, I know of one exception: an American woman doctor who had, however, never been active in medical practice.[1]

I venture to mention yet another factor, without which the situation in America cannot be understood. The American superego seems greatly to reduce its severity towards the ego when financial income is at stake. But the reader probably feels that I have now said enough insulting things about this country before which we have learnt to bow during the last decade.[2]

I am coming to my conclusion: [. . .]

1 [This presumably refers to Ruth Mack Brunswick.]

2 [A reference to the role that America played at the end of the First World War; cf. Freud's (1966*b*; *RSE*, **22**) 'Introduction' to Bullitt's biography of Woodrow Wilson (1967).]

APPENDIX B

UNPUBLISHED POSTSCRIPT & ADDENDA (1993 [1935])

During her study of Freud's manuscripts at the Library of Congress in Washington, Ilse Grubrich-Simitis (1993, 292–302) discovered a previously unknown manuscript with the title 'Postscript to The Question of Lay Analysis (1935)', together with two pages of 'Notes for Lay Analysis'. Subsequent research led her to the following reconstruction. The publisher of the first American edition of *The Question of Lay Analysis* (Brentano, New York) bound it together with an English translation of Freud's *Autobiographical Study* (1925*d*). The rights to these two works were later taken over by another New York publisher, W. W. Norton & Co. The plan then arose (in 1935) to bring out a new edition, and the publisher evidently asked Freud to revise and update both works. However, Freud evidently wanted them to be published separately, and accordingly prepared separate Postscripts together with the textual revisions. The revised and updated version of *An Autobiographical Study* (with a new English title) appeared later in the same year; but for unknown reasons Norton delayed issuing the new edition of the *Lay Analysis* until 1950. The book then appeared without Freud's Postscript and addenda of 1935, the existence of which having evidently been forgotten in the interim, until Grubrich-Simitis rediscovered them among Freud's papers in Washington.

This material was first published in German in Grubrich-Simitis's (1993) book *Zurück zu Freuds Texten*, Frankfurt: S. Fischer Verlag, pp. 297–302. A translation by Philip Slotkin appeared in the English edition of the same book, *Back to Freud's Texts*, New Haven: Yale University Press (1996), pp. 232–8. The present translation is by Mark Solms.

UNPUBLISHED 1935 POSTSCRIPT

This pamphlet was written in 1926 and was made available to American readers in 1927 (by the publisher Brentano). Now that the question of a reissue has arisen, I have reviewed it carefully and come to the conclusion that it can remain as it is; far-reaching revisions are neither necessary nor practicable. The sympathetic reader will quietly delete certain details which are no longer relevant. We in Austria no longer want to align ourselves with conditions in the German Reich [p. 209], and the expectation – although never entirely serious – that American generosity would solve the problems of mental welfare along

psychoanalytic lines [p. 222] has not survived the decline of American 'prosperity'.[1] For the rest, I think that a few notes will suffice to raise this account to the level of our current knowledge.

The treatise *The Question of Lay Analysis* was a true *pièce d'occasion*. It had happened in Vienna that a charge was falsely laid by a psychopathic patient against one of our colleagues – a capable and trustworthy man, a non-doctor but a Ph.D. – to the effect that he had claimed a medical qualification in order to entice him (the patient) into treatment. The Austrian quackery law is strict, so we feared that this incident would provide the authorities with an opportunity to unconditionally prohibit the practice of analysis by laymen. The 'Impartial Person' of my booklet really did exist, and is still alive today. He is an influential member of our educational establishment,[2] for whom I prepared a report concerning the matter at issue. I do not know whether my argument made much of an impression; in any event, lay analysis was not then prohibited in Austria.

The essay which issued from this report did not meet with a happy fate. It is among those few of my writings which have not enjoyed a second edition in German, which have seldom been translated and which are hardly ever cited. In my opinion this treatment was unfair. It is well written and thoroughly deserves the praise that my late friend Ferenczi bestowed on it in his 'Introduction' [to the 1927 English translation]. But I had once again taken a stand against a prejudice and sharply condemned the conduct of the medical profession, to which I myself have belonged for over fifty years, and that could not – at least initially – have had any other outcome.

UNPUBLISHED 1935 ADDENDA

[Note added to the sentence on p. 180, line 26, starting – 'The ego, as we put it, institutes a *repression* of these drive impulses.':]

I must draw the attention of the reader to the theory of psychoanalysis. The description in the text of the motive for repression recognizes only the case where the satisfaction of a drive is dangerous for the reason that it could lead to a 'collision with the external world'. The question, however, is whether this is the sole or actually only the original condition for repression. Does repression – this attempt at flight from the drive by the ego – not rather occur every time the intensity of the drive

1 [In English in the original.]

2 [See Editors' Note, p. 160 above.]

demand becomes too great for the ego to master? In this case, consideration of the danger emanating from the external world is irrelevant. The question is not yet decided and the relations between the two possible motives for repression are not yet clarified.

[Note added to the sentence on p. 189, line 9, starting – 'The first object of a boy's love is his mother, and of a girl's her father . . .':]

Our investigations have since taught us that the mother is the first love object of the girl too. By way of a long detour she later succeeds in putting the father in the place of the mother.

[Note added to the sentence on p. 198, line 13, starting – 'In civil life illness can be used as a screen to gloss over incompetence in one's profession or in competition with other people . . .':]

This is the viewpoint which so-called Individual Psychology detached from the framework of psychoanalysis and made popular through unwarranted generalization.

[Note added to the first occurrence of the word 'superego' on p. 198, line 30:]

It has become customary in the English psychoanalytic literature to replace the English pronouns 'I' and 'It'[1] with the Latin ones 'ego' and 'id'. In German we say *Ich*, *Es* and *Überich*.

[Note added to the sentence on p. 201, line 19, ending – '. . . there can be no doubt that it has taken the place of the neurosis and that our work has had the result of driving out one form of illness with another.':]

This characteristic of the transference in analytic treatment was the principal reason [*Motiv*] for assigning to erotic impulses a predominant and perhaps specific role in the aetiology of the neuroses. The general question arises, however, whether destructive (or aggressive) impulses might not claim the same status in every respect. The account given in the text takes only the erotic drive into account, in accordance with an older version of the theory.

[Note added to the sentence on p. 203, line 15, beginning – 'A third training institute is at this moment being opened . . .':]

The number of training institutes has increased considerably and the psychoanalytic educational enterprise has been greatly improved since the above was written.

1 [The word is capitalized in the original manuscript.]

[Note added to the sentence on p. 215, line 20, ending – '. . . under this burden, then, our ego takes refuge in repression and lays itself open to an infantile neurosis, the precipitate of which it carries with it into maturity as a disposition to a later nervous illness.':]

To this should be added the task of taming the innate aggressive inclination inherent in man's constitution. This inclination is, naturally, incompatible with the preservation of human society. There is no doubt as to whether our civilization rests on the suppression of drives; the question is whether it is built more at the expense of the erotic than of the destructive drives.

APPENDIX C

DR REIK AND THE PROBLEM OF QUACKERY[1]

A Letter to the *Neue Freie Presse* (1926)

Dear Sir, [21, 247]

In an article in your issue of July 15 dealing with the case of my pupil, Dr Theodor Reik, or, more precisely, in a section of it headed 'Information from Psychoanalytic Circles', there is a passage on which I should like to make a few remarks by way of correction.

The passage runs: '. . . during the last few years he has become convinced that Dr Reik, who has gained a wide reputation from his philosophical and psychological writings, possesses a far greater gift for psychoanalysis than the physicians attached to the Freudian School; and he [Freud] has entrusted the most difficult cases only to him and to his daughter Anna, who has proved quite specially adept in the difficult technique of psychoanalysis.'

Dr Reik himself would, I think, be the first to reject any such account of the basis of our relations. It is true, however, that I have availed myself of his skill in particularly difficult cases, but this has only been where the symptoms lay in a sphere far removed from the physical one. And I have never failed to inform a patient that he is not a physician but a psychologist.

My daughter Anna has devoted herself to the pedagogic analysis of children and adolescents. I have never yet referred to her a case of severe neurotic illness in an adult. Incidentally, the only case with moderately severe symptoms verging on the psychiatric which she has [21, 248] hitherto treated repaid the physician who referred it to her by its complete success.

I take the opportunity of informing you that I have just sent to press a small work on *The Question of Lay Analysis*. In it I have tried to show

1 ['Dr Reik und die Kurpfuschereifrage.' This letter was published in the *Neue Freie Presse* of Sunday, July 18, 1926, p. 12. It was reprinted in 1987 in *GW*, **Nachtr.**, 715. An English translation by an unspecified hand appeared in *Bull. Am. Psychoan. Ass.*, **4** (1948), 56, where it was wrongly dated 'July 18, 1928'. The present translation is a slightly revised version of the one by James Strachey that first appeared in *SE*, **21** (1959), 247–8, and was reprinted in *PFL*, **15** (1986), 267–8. An account of the circumstances which led to Freud's writing the letter is given in the Editors' Note to *The Question of Lay Analysis* (1926*e*), p. 160 above.]

what a psychoanalysis is and what demands it makes on the analyst. I have considered the far from simple relations between psychoanalysis and medicine, and have drawn the conclusion that any mechanical application to trained analysts of the section against quackery [in the criminal code] is open to grave doubts.

Since I have given up my Vienna practice and have cut down my activity to the treatment of a very few foreigners, I trust that this announcement will not involve me, too, in a prosecution for unprofessional advertisement.

Yours &c.,
Professor Freud

PSYCHOANALYSIS

ENGLISH TRANSLATIONS

'Psychoanalysis: Freudian School'
1926 In *Encyclopaedia Britannica*, 13th ed., New Vol. 3, 253–5. (Tr. James Strachey.)
1929 In *Encyclopaedia Britannica*, 14th ed., **18**, 672–4. (Reprint of above.)
'Psycho-Analysis'
1959 *SE*, **20**, 263–70. (Revised version of above.)

The present translation is a slightly corrected reprint of the *SE* version. The article is reprinted here by arrangement with the publishers of the *Encyclopaedia Britannica*.

The eleventh edition of the *Encyclopaedia Britannica* appeared in 1910–11. It contained no reference to psychoanalysis. After the First World War, in 1922, there appeared what was described as the 'twelfth edition'. This consisted of the old eleventh edition together with three 'New Volumes'. There was still no article on psychoanalysis. Soon afterwards it was decided to bring out, in 1926, a 'thirteenth edition', which was to consist again of the old eleventh edition with the addition once more of three 'New Supplementary Volumes' – but different ones from those that had made up the 'twelfth edition'. This time an article on psychoanalysis was judged necessary, and Freud himself was asked to contribute it. He was no doubt glad to accept the invitation, since the *Encyclopaedia Britannica* occupied a warm place in his heart. While he was preparing *Totem and Taboo*, he wrote to Ernest Jones (on February 24, 1912) giving a list of all the authorities he had consulted, and [262]
wound up with evident pride: 'I am now even in possession of the *Encyclopaedia Britannica*, 11th ed., 1911.' (Jones, 1953, 395.) And it was a work which he was always

eager to consult.[1] Already, moreover, in 1924, he had contributed a long chapter on psychoanalysis to a two-volume compilation which had been issued by the publishers of the *Encyclopaedia Britannica* under the title *These Eventful Years*.[2] Very shortly after the publication of the thirteenth edition, the necessity for producing a complete new edition of the entire work was recognized. A move was made to replace Freud's article with a different one; but, through the joint efforts of Ernest Jones and Freud himself, this notion was scotched, and the article was retained unaltered in the fourteenth edition (1929) and all subsequent ones.

In fact, however, when the German original came to light in 1934, it was seen that a certain number of small, but not unimportant, changes had from the first been made in the English version. The title of the article, for instance, had been altered from 'Psychoanalysis' to 'Psychoanalysis: Freudian School',[3] and an uncomplimentary reference to Jung and Adler had been expunged. Additional cross-headings, too, had been inserted, which do not appear to assist the thread of Freud's argument. For present purposes the best plan has seemed to be to go back to the original German as prepared by Freud, the more important divergences from the *Encyclopaedia* version being indicated in footnotes. The opportunity has also been taken of revising the translation and bringing some of the technical terms into line with the usage adopted elsewhere in this edition.

1 In 1924, on Ferenczi's fiftieth birthday, Freud presented him with a set of the eleventh edition (Jones, 1957, 115).

2 This has been wrongly identified with the present article in Jones, 1957, 140. It can be found in *RSE*, **19**, with the title 'A Short Account of Psychoanalysis' (1924*f*).

3 In the reissues of the *Encyclopaedia* published since 1953, however, the original title of the article has been restored.

PSYCHOANALYSIS

Since psychoanalysis was not mentioned in the eleventh edition of the *Encyclopaedia Britannica*, it is impossible to restrict this account to its advances since 1910. The more important and the more interesting portion of its history lies in the period before that date.[1] [263]

PREHISTORY

In the years 1880–2 a Viennese physician, Dr Josef Breuer (1842–1925), discovered a new procedure by means of which he relieved a girl, who was suffering from severe hysteria, of her many and various symptoms. The idea occurred to him that the symptoms were connected with impressions which she had received during a period of agitation while she was nursing her sick father. He therefore induced her, while she was in a state of hypnotic somnambulism, to search for these connections in her memory and to live through the 'pathogenic' scenes once again without inhibiting [*ungehemmter*]^{T} the affects that arose in the process. *Hemmung* He found that when she had done this the symptom in question disappeared for good.

This was at a date before the investigations of Charcot and Pierre Janet into the origin of hysterical symptoms, and Breuer's discovery was thus entirely uninfluenced by them. But he did not pursue the matter any further at the time, and it was not until some ten years later that he took it up again in collaboration with Sigmund Freud. In 1895 they published a book, *Studies on Hysteria*, in which Breuer's discoveries were described and an attempt was made to explain them by the theory of '*catharsis*'. According to that hypothesis, hysterical symptoms originate through the energy of a mental [*seelischen*]^{T} process being withheld *Seele* from conscious influence and being diverted into bodily innervation

1 [This paragraph was omitted in the *Encyclopaedia Britannica*. It is explained by the fact that Freud was writing a contribution to the three supplementary volumes issued in 1926, which were merely intended to bring the eleventh edition, published in 1910–11, up to date.]

('*conversion*'). A hysterical symptom would thus be a substitute for an
[264] omitted mental act and a reminiscence of the occasion which should have given rise to that act. And, on this view, recovery would be a result of the liberation of the affect that had gone astray and of its discharge
abführen [*Abfuhr*][T] along a normal path ('*abreaction*'). Cathartic treatment gave excellent therapeutic results, but it was found that they were not permanent and that they were not independent of the personal relation between the patient and the physician. Freud, who later proceeded with these investigations by himself, made an alteration in their technique, by replacing hypnosis with the method of free association [*freien Association*][T]. He invented the term 'psychoanalysis', which in the course of time came to have two meanings: (1) a particular method of treating nervous disorders and (2) the science of unconscious mental processes, which has also been appropriately described as 'depth psychology'.

SUBJECT MATTER OF PSYCHOANALYSIS

Psychoanalysis finds a constantly increasing amount of support as a therapeutic procedure, owing to the fact that it can do more for its patients[1] than any other method of treatment. The principal field of its application is in the milder neuroses – hysteria, phobias and obsessional
Zwang states [*Zwangszustände*][T]; and in malformations of character and sexual
Sex [*sexuelle*][T] inhibitions or abnormalities it can also bring about marked improvements or even recoveries. Its influence upon dementia praecox and paranoia is doubtful; on the other hand, in favourable circumstances it can cope with depressive states, even if they are of a severe type.

In every instance the treatment makes heavy claims upon both the physician and the patient: the former requires a special training and must devote a long period of time to exploring the mind of each patient, while the latter must make considerable sacrifices, both material and mental. Nevertheless, all the trouble involved is as a rule rewarded by the results. Psychoanalysis does not act as a convenient panacea ('*cito, tute, jucunde*') for psychological disorders. On the contrary, its application has been instrumental in making clear for the first time the
[265] difficulties and limitations in the treatment of such affections. For the moment it is only in Berlin and Vienna that there are voluntary institutions which make psychoanalytic treatment accessible to the wage-earning classes.[2]

1 [In the *Encyclopaedia Britannica*: 'for certain classes of patients'.]

2 [In the *Encyclopaedia Britannica* this sentence was transferred to the end of the article.]

The therapeutic influence of psychoanalysis depends on the replacement of unconscious mental acts by conscious ones and is effective within the limits of that factor. The replacement is effected by overcoming internal resistances in the patient's mind. The future will probably attribute far greater importance to psychoanalysis as the science of the unconscious than as a therapeutic procedure.

Psychoanalysis, in its character of depth psychology, considers mental life from three points of view: the dynamic, the economic and the topographical.

From the first of these standpoints, the *dynamic* one, psychoanalysis derives all mental processes (apart from the reception of external stimuli) from the interplay of forces [*Kräften*]^{T}, which assist or inhibit one another, combine with one another, enter into compromises with one another, etc. All of these forces are originally in the nature of *drives* [*Triebe*]^{T}; thus they have an organic origin. They are characterized by possessing an immense (somatic) store of power ('*the compulsion to repeat*' [*Wiederholungszwang*]); and they are represented mentally as images or ideas [*Vorstellungen*]^{T} with an affective charge [*affektiv besetzten*]^{T}. In psychoanalysis, no less than in other sciences, the theory of the drives is an obscure subject. An empirical analysis leads to the formulation of two groups of drives: the so-called 'ego drives' [*Ichtriebe*]^{T}, which are directed towards self-preservation [*Selbstbehauptung*], and the 'object drives', which are concerned with relations to an external object. The social drives are not regarded as elementary or irreducible. Theoretical speculation leads to the suspicion that there are two fundamental drives which lie concealed behind the manifest ego drives and object drives: namely (*a*) Eros, the drive which strives for ever closer union, and (*b*) the drive to destruction, which leads towards the dissolution of what is living. In psychoanalysis the manifestation of the force of Eros is given the name '*libido*'.

Besetzung

Ich

From the *economic* standpoint psychoanalysis supposes that the mental representatives of the drives have a charge (*cathexis*)[1] of definite quantities of energy, and that it is the purpose of the mental apparatus to hinder any damming up of these energies and to keep as low as possible the total amount of the excitations [*Erregungen*]^{T} with which it is loaded. The course [*Ablauf*] of mental processes is automatically regulated by the '*pleasure–unpleasure principle*' [*Lust–Unlust-Prinzip*]^{T}; and unpleasure is thus in some way related to an increase of excitation and

[266]

1 [The word is in English in the German original. This seems to be the only instance in which Freud himself used this English equivalent of the German '*Besetzung*'.]

pleasure to a decrease. In the course of development the original pleasure principle undergoes a modification with reference to the external world, giving place to the '*reality principle*', in accordance with which the mental apparatus learns to postpone the pleasure of satisfaction and to tolerate temporarily feelings of unpleasure.

Topographically, psychoanalysis regards the mental apparatus as a compound instrument, and endeavours to determine at what points in it the various mental processes take place. According to the most recent psychoanalytic views, the mental apparatus is composed of an '*id*' [*Es*]^{T}, which is the repository of the drive impulses, of an '*ego*' [*Ich*]^{T}, which is the most superficial portion of the id and one which has been modified by the influence of the external world, and of a '*superego*' [*Über-Ich*]^{T}, which develops out of the id, dominates the ego and represents the inhibitions of drive that are characteristic of man. The quality of consciousness, too, has a topographical reference; for processes in the id are entirely unconscious, while consciousness is the function of the ego's outermost layer, which is concerned with the perception of the external world.

At this point two observations may be in place. It must not be supposed that these very general ideas are presuppositions upon which the work of psychoanalysis depends. On the contrary, they are its latest conclusions and are 'open to revision'.[1] Psychoanalysis is founded securely upon the observation of the facts of mental life; and for that very reason its theoretical superstructure is still incomplete and subject to constant alteration. Secondly, there is no reason for surprise that
[267] psychoanalysis, which was originally no more than an attempt at explaining pathological mental phenomena, should have developed into a psychology of normal mental life. The justification for this arose with the discovery that the dreams and mistakes [*Fehlleistungen*]^{T} of normal men have the same mechanism as neurotic symptoms.

The first task of psychoanalysis was the elucidation of nervous disorders. The analytic theory of the neuroses is based on three cornerstones: the recognition of (1) '*repression*', of (2) the importance of the sexual drive and of (3) '*transference*'.[2]

(1) There is a force in the mind which exercises the functions of a censorship, and which excludes from consciousness and from any influence upon action all tendencies which displease it. Such tendencies are

1 [In English in the original. In the *Encyclopaedia Britannica* the phrase is preceded by the words 'in every respect'.]

2 [The words 'repression' and 'transference' are in English in the original.]

described as 'repressed'. They remain unconscious; and if one attempts to bring them into the patient's consciousness one provokes a '*resistance*'.[1] These repressed drive impulses, however, have not always become powerless. In many cases they succeed in making their influence felt in the mind by circuitous paths, and the indirect or substitutive satisfactions of repressed impulses thus achieved are what constitute neurotic symptoms.

(2) For cultural [*kulturellen*][T] reasons the most intense repression falls upon the sexual drives; but it is precisely in connection with them that repression most easily miscarries, so that neurotic symptoms are found to be substitutive satisfactions of repressed sexuality. The belief that in man sexual life begins only at puberty is incorrect. On the contrary, signs of it can be detected from the beginning of extrauterine existence; it reaches a first culminating point at or before the fifth year ('early period'), after which it is inhibited or interrupted ('latency period') until the age of puberty, which is the second climax of its development. This diphasic onset of sexual development seems to be distinctive of the genus Homo. All experiences during the first period of childhood are of the greatest importance to the individual, and in combination with his inherited sexual constitution form the dispositions for the subsequent development of character and disease. It is wrong to make sexuality coincide with 'genitality'. The sexual drives pass through a complicated course of development, and it is only at the end of it that the 'primacy of the genital zones' is attained. [268] Before this there are a number of 'pregenital' organizations of the libido – points at which it may become 'fixated' ['*fixieren*'][T] and to which, in the event of subsequent repression, it will return ('*regression*'). The infantile fixations of the libido are what determine the form of any later neurosis. Thus the neuroses are to be regarded as inhibitions in the development of the libido. There are no specific causes of nervous disorders; the question whether a conflict finds a healthy solution or leads to a neurotic inhibition of function depends upon quantitative considerations.

Kultur

Fixierung

The most important conflict with which a small child is faced is his relation to his parents, the '*Oedipus complex*'; it is in attempting to grapple with this problem that those destined to suffer from a neurosis habitually come to grief. The reactions against the drive demands of the Oedipus complex are the source of the most precious and socially important achievements of the human mind; and this holds true not

1 [In English in the original.]

only in the life of individuals but probably also in the history of the human species as a whole. The superego, too, the moral agency which dominates the ego, has its origin in the process of overcoming the Oedipus complex.

(3) By '*transference*' is meant a striking peculiarity of neurotics. They develop towards their physician emotional relations, both of an affectionate and hostile character, which are not based upon the actual situation but are derived from their relations to their parents (the Oedipus complex). Transference is a proof of the fact that adults have not overcome their former childish dependence; it coincides with the force which has been named 'suggestion'; and it is only by learning to make use of it that the physician is enabled to induce the patient to overcome his internal resistances and do away with his repressions. Thus psychoanalytic treatment acts as a second education [*Nacherziehung*] of the adult, as a corrective to his education [*Erziehung*][T] as a child.

Within this narrow compass it has been impossible to mention many matters of the greatest interest, such as the '*sublimation*' of drives, the part played by *symbolism*, the problem of '*ambivalence*', etc. Nor has there been space to allude to the applications of psychoanalysis, which originated, as we have seen, in the sphere of medicine, to other departments of knowledge (such as social anthropology, the study of religion,
[269] literary history and education [*Pädagogik*]) where its influence is constantly increasing. It is enough to say that psychoanalysis, the psychology of the deepest, unconscious mental acts, promises to become the link between psychiatry and all of these branches of human science [*Geisteswissenschaften*].

THE EXTERNAL HISTORY OF PSYCHOANALYSIS

The beginnings of psychoanalysis may be marked by two dates: 1895, which saw the publication of Breuer & Freud's *Studies on Hysteria*, and 1900, which saw that of Freud's *The Interpretation of Dreams*. At first the new discoveries aroused no interest either in the medical profession or among the general public. In 1907 the Swiss psychiatrists, under the leadership of E. Bleuler and C. G. Jung, began to concern themselves in the subject; and in 1908 there took place at Salzburg a first meeting of adherents from a number of different countries. In 1909 Freud and Jung were invited to America by G. Stanley Hall to deliver a series of lectures on psychoanalysis at Clark University, Worcester, Mass. From that time

forward interest grew rapidly in Europe; it expressed itself, however, in a very forcible rejection of the new teachings – a rejection which often showed an unscientific colouring.

The reasons for this hostility were to be found, from the medical point of view, in the fact that psychoanalysis lays stress upon psychical factors, and from the philosophical point of view, in its assuming as an underlying postulate the concept of unconscious mental activity; but the strongest reason was undoubtedly the general disinclination of mankind to concede to the factor of sexuality the importance that is assigned to it by psychoanalysis. In spite of this widespread opposition, however, the movement in favour of psychoanalysis was not to be checked. Its adherents formed themselves into an International Association, which passed successfully through the ordeal of the World War, and at the present time (1925) comprises local groups in Vienna, Berlin, Budapest, London, Switzerland, Holland, Moscow and Calcutta, as well as two in the United States. There are three periodicals representing the views of these societies: the *Internationale Zeitschrift für Psychoanalyse*, *Imago* (which is concerned with the application of psychoanalysis to non- [270]
medical fields of knowledge), and the *International Journal of Psycho-Analysis*.

During the years 1911–13 two former adherents, Alfred Adler, of Vienna, and C. G. Jung, of Zürich, seceded from the psychoanalytic movement and founded schools of thought of their own, which, in view of the general hostility to psychoanalysis, could be certain of a favourable reception, but which remained scientifically sterile.[1] In 1921 Dr M. Eitingon founded in Berlin the first public psychoanalytic clinic and training school, and this was soon followed by a second in Vienna.

BIBLIOGRAPHY[2]

Breuer & Freud, *Studien über Hysterie* (1895); Freud, *Traumdeutung* (1900); *Zur Psychopathologie des Alltagslebens* (1904); *Drei Abhandlungen zur Sexualtheorie* (1905); *Vorlesungen zur Einführung in die Psychoanalyse* (1916). Freud's complete works have been published in German (*Gesammelte Schriften*) (1925), and in Spanish (*Obras completas*) (1923); the greater part of them has been translated into English and other languages. Short accounts of the subject matter and history of psychoanalysis can be found in: Freud, *Über Psychoanalyse* (the

ADDRESS TO THE SOCIETY OF B'NAI B'RITH

(1926)

EDITORS' NOTE

ANSPRACHE AN DIE MITGLIEDER DES VEREINS B'NAI B'RITH

GERMAN EDITIONS

1926 *B'nai B'rith Mitteilungen für Österreich*, **26** (5), 103–5.
1941 *GW*, **17**, 51–3. [272]

ENGLISH TRANSLATION

'Address to the Society of B'nai B'rith'
1959 *SE*, **20**, 273–4. (Tr. James Strachey.)

The present translation is a very slightly revised reprint of the *SE* version. A few sentences of it were given in a footnote on p. 312 of *The Origins of Psycho-Analysis* (1954), the English translation of Freud (1950*a*).

This address was read on Freud's behalf at a meeting of the B'nai B'rith held on May 6, 1926, in honour of his seventieth birthday. It had been preceded by a laudatory speech made by his physician, Professor Ludwig Braun.

The B'nai B'rith (Sons of the Covenant) is an order which represents Jewish interests, cultural, intellectual and charitable. Originally founded in the United States in the middle of the nineteenth century, it has branch lodges in many parts of the world. Freud joined the Vienna group on September 29, 1897, and he used for many years to be a regular attendant at its meetings on alternate Tuesdays. From time to time he himself gave lectures there, the subjects of some of which have been recorded: two lectures on dreams in December, 1897, and April, 1902; another, on the psychology of forgetting, in February, 1899; one on 'The Mental Life of the Child' in February, 1900; on Zola's *La fécondité*[1] on April 27, 1900; on Anatole France's *La révolte des anges*, the date of which is uncertain; on 'Chance and Superstition' in February, 1901; on 'The Physiology of the Unconscious' in 1905; on 'Psychology in the Service of the Administration of Justice' in March, 1907; on *Hamlet* in 1911; on 'What is Psychoanalysis?' in November, 1913; and – perhaps the best known of them – on 'Death and Us' in February, 1915, which became the second half of his 'Thoughts for the Times on War and Death' in 1915 (Freud, 1915*b*; *RSE*, **14**).

1 This was one of the 'ten good books' selected by Freud in his 'Contribution to a Questionnaire on Reading' (1906*f*), *RSE*, **9**, 218.

It is clear from the topics and dates of the presentations that Freud's B'nai B'rith lectures frequently served as models for well-known publications. A detailed account of Freud's relationship with the B'nai B'rith can be found in Klein (1985, 69–102).

ADDRESS TO THE SOCIETY OF B'NAI B'RITH

Most honourable Grand President, honourable Presidents, dear Brethren, I thank you for the honours you have paid me today. You know why it is that you cannot hear the sound of my own voice. You have heard one of my friends and pupils speak of my scientific work; but a judgement on such things is hard to form and for a long while yet it may not be reached with any certainty. Allow me to add something to what has been said by one who is both my friend and the physician who cares for me. I should like to tell you briefly how I became a B.B. and what I have looked for from you. [273]

It happened that in the years from 1895 onwards I was subjected to two powerful impressions which combined to produce the same effect on me. On the one hand, I had gained my first insight into the depths of the life of the human drives [*Trieblebens*][T]; I had seen some things that were sobering and even, at first, frightening. On the other hand, the announcement of my unpleasing discoveries had as its result the severance of the greater part of my human contacts; I felt as though I were despised and universally shunned. In my loneliness I was seized with a longing to find a circle of selected men of high character who would receive me in a friendly spirit in spite of my temerity. Your society was pointed out to me as the place where such men were to be found. *Trieb*

That you were Jews could only be agreeable to me; for I was myself a Jew, and it had always seemed to me not only unworthy but positively senseless to deny [*verleugnen*][T] the fact. What bound me to Jewry was (I am ashamed to admit) neither faith nor national pride, for I have always been an unbeliever and was brought up without any religion, though not without a respect for what are called the 'ethical' standards of human civilization [*Kultur*][T]. Whenever I felt an inclination to national enthusiasm I strove to suppress it as being harmful and wrong, alarmed by the warning examples of the peoples among whom we Jews live. But plenty of other things remained over to make the attraction of Jewry and Jews irresistible – many obscure emotional forces, which [274] *Verleugnung*

were the more powerful the less they could be expressed in words, as well as a clear consciousness of inner identity, the safe privacy of a common mental [*seelischen*][T] construction. And beyond this there was a perception that it was to my Jewish nature alone that I owed two characteristics that had become indispensable to me in the difficult course of my life. Because I was a Jew I found myself free from many prejudices which restricted others in the use of their intellect; and as a Jew I was prepared to join the Opposition and to do without agreement with the 'compact majority'.[1]

Seele

So it was that I became one of you, took my share in your humanitarian and national interests, gained friends among you and persuaded my own few remaining friends to join our society. There was no question whatever of my convincing you of my new theories; but at a time when no-one in Europe listened to me and I still had no disciples even in Vienna, you gave me your kindly attention. You were my first audience.

For some two thirds of the long period that has elapsed since my entry I persisted with you conscientiously, and found refreshment and stimulation in my relations with you. You have been kind enough today not to hold it up against me that during the last third of the time I have kept away from you. I was overwhelmed with work, and demands connected with it forced themselves on me; the day ceased to be long enough for me to attend your meetings, and soon my body began to rebel against a late evening meal. Finally came the years of my illness, which prevents me from being with you even today.

I cannot tell whether I have been a genuine B.B. in your sense. I am almost inclined to doubt it; so many exceptional circumstances have arisen in my case. But of this I can assure you – that you meant much to me and did much for me during the years in which I belonged to you. I ask you therefore to accept my warmest thanks both for those years and for today.

Yours in W. B. & E.[2]
Sigm. Freud

1 [Cf. above, footnote 1, p. 7.]

2 [The abbreviation stands for '*Wohlwollen, Bruderliebe und Eintracht*', the motto of the Order, which is translated 'Benevolence, Brotherly Love and Harmony'.]

Shorter Writings

(1926)

KARL ABRAHAM[1]

(1926)

Dr Karl Abraham, President of the Berlin group, of which he was the [277]
founder, and President at the time of the International Psychoanalytical Association, died in Berlin on December 25 [1925]. He had not reached the age of fifty[2] when he succumbed to an internal complaint against which his powerful physique had had to contend ever since the spring. At the Homburg Congress[3] he had seemed, to the great joy of us all, to have recovered; but a relapse brought us painful disappointment.

We bury with him – *integer vitae scelerisque purus*[4] – one of the firmest hopes of our science, young as it is and still so bitterly assailed, and a part of its future that is now, perhaps, unrealizable. Among all those who followed me along the dark paths of psychoanalytic research, he won so pre-eminent a place that only one other name could be set beside his.[5] It is likely that the boundless trust of his colleagues and pupils would have called him to the leadership; and he would without doubt have been a model leader in the pursuit of truth, led astray neither by the praise or blame of the many nor by the seductive illusion of his own phantasies.

I write these lines for friends and fellow workers who knew and valued Abraham as I did. They will find it easy to understand what the loss of this friend, so much younger than I am, means to me; and they will forgive me if I make no further attempt to express what it is so hard to put into words. An account of Abraham's scientific personality and an [278]
appreciation of his work will be undertaken for our journal by another hand.[6]

5 [Freud no doubt had Ferenczi in mind.]

6 [The following issues of the *Zeitschrift* and the *Journal* contained a long obituary of Abraham by Ernest Jones (1926).]

TO ROMAIN ROLLAND[1]

(1926)

Vienna IX, Berggasse 19
January 29, 1926

[279] Unforgettable one! By what troubles and sufferings must you have fought your way up to such a height of humanity as yours!

Long years before I saw you, I had honoured you as an artist and as an apostle of the love of mankind. I was myself a disciple of the love of mankind, not from sentimental motives or in pursuit of an ideal, but for sober, economic reasons, because, our inborn drives and the world around us being what they are, I could not but regard that love as no less essential for the survival of the human race than such things as technology.

And when at last I came to know you personally, I was surprised to find that you can value strength and energy so highly and that you yourself embody such force of will.

May the next decade bring you nothing but fulfilments!

Most cordially yours
Sigm. Freud, aetat. 70

1 ['An Romain Rolland.' In *Liber amicorum Romain Rolland*, 152, Zürich and Leipzig, Rotapfel. (Published to celebrate Rolland's 60th birthday on January 29, 1926.) Reprinted *GS*, **11** (1928), 275; *GW*, **14** (1948), 553. English translation by James Strachey: *SE*, **20**, 279. The present translation is a very slightly modified reprint. Ten years later, Freud paid a greater tribute to the same author by the dedication to him of his paper 'A Disturbance of Memory on the Acropolis' (1936*a*), *RSE*, **22**, 255 ff.]

PREFATORY NOTE TO A PAPER BY E. PICKWORTH FARROW[1]

(1926)

The author of this paper is known to me as a man of strong and independent intelligence. Probably through being somewhat self-willed he failed to get on to good terms with two analysts with whom he made the attempt. He thereupon proceeded to make a systematic application of the procedure of self-analysis which I myself employed in the past for the analysis of my own dreams. His findings deserve attention precisely on account of the peculiar character of his personality and of his technique.[2] [280]

1 [Prefatory note to E. Pickworth Farrow's 'Eine Kindheitserinnerung aus dem 6. Lebensmonat' ('A Childhood Memory from the Sixth Month of Life'), *Int. Z. Psychoan.*, **12** (1) (1926), 79; *GW*, **14** (1948), 568. This appeared at the head of Farrow's paper, introduced by the words: 'Professor Freud writes to us as follows in connection with this paper.' There is no trace of the paper itself having appeared in English, but its substance was incorporated many years later into a volume by the author: *A Practical Method of Self-Analysis*, London, Allen & Unwin, 1942; New York, International Universities Press, 1945. An English translation of Freud's note was printed as a Preface to that volume, with a statement that it was included by his permission. (This was, of course, some years after his death.) The subject was also dealt with by Farrow in several papers contemporary with the present one: Farrow (1925*a*, 1925*b*, 1925*c* and 1927). – The present translation is a different one by James Strachey, and appears by arrangement with Messrs George Allen & Unwin. It was first published in *SE*, **20**, 280.]

2 [In his paper Farrow reported having arrived at a detailed memory of being slapped by his father at the age of six months. A short discussion of Freud's views on self-analysis can be found in an Editors' footnote in *RSE*, **14**, 17 *n.* 1.]

BIBLIOGRAPHY

[Titles of books and periodicals are in italics; titles of papers are in inverted commas. Abbreviations are in accordance with the *World List of Scientific Periodicals* (London, 1963–5). Further abbreviations used in this volume can be found in the List at the end of this bibliography. Numerals in bold type refer to volumes; ordinary numerals refer to pages. In the case of the Freud entries, the letters attached to the dates of publication are in accordance with the corresponding entries in the complete bibliography of Freud's writings in the last volume of the *Revised Standard Edition*.

GENERAL INDEX

Abasia, 79
Abraham, *K.* (*see also* Bibliography), 46, 53, 160, 226, 263
Abreaction
  of affect, 18–19, 26, 247–8
  of birth trauma, 75, 123, 134, 143, 147–8, 235
Actual neuroses (*see also* Anxiety neurosis; Neurasthenia), 21–2, 70–2, 97, 125, 142
Adler, *A.* (*see also* Bibliography), 44, 46, 133, 185 *n.* 1, 228, 246, 253
Affect
  abreaction of, 18–19, 26, 247–8
  and drives, 249
  anxiety as, 71, 83, 96, 112, 115–19, 124
  as reproduction of early experience, 74, 83, 118, 133–4, 143
  nature of, 83, 117–18
  repression of, 99, 104, 107
  strangulated, 18–19
  suppression of, 80
  transformation of, 81
After-pressure, 83–4
Aggressive impulses, 93, 94–6, 103–4, 108–9, 110–11, 130, 180, 239–40
Agoraphobia, 97, 112–13, 128, 165
Alone, fear of being, 121, 131, 149
Ambivalence, 44, 58, 59, 100, 108, 252
  conflict due to, 91–2, 111, 139–40
America, 4, 44, 45–6, 63, 65, 163, 210, 224, 230, 233–6, 237–8, 252–3
American Journal of Psychology, 5 *n.* 1
Amnesia
  concerning early childhood, 28, 34, 40
  hypnotic, 15, 23–4
  hysterical, 107, 145
Anaesthesia
  by cocaine, 12
  hysterical, 11–12
Anal erotism (*see also* Sadistic impulses), 103
Analogies
  army, rate of progress of, 199–200
  astronomers, personal equation in, 195
  'behind the lines' and 'at the front', 174–5
  criticisms of the government, 186
  foreign body in living tissue, 86–7, 88
  frontier station with mixed garrison, 87
  inoculation against illness, 143
  insurance agent, 202
  legless man's pension, 88
  maidservant who refuses to cook, 79
  ore containing precious metal, 195
  public opinion controlled by a minority, 82
  quality and quantity in chemical substances, 49
  'reservation', world of imagination as, 56
  speculator whose money is tied up, 80
  traveller singing in the dark, 85
  two paths leading to a hilltop, 220
  vinegar and wine, 71
Animal
  equated with father, 58, 90–3, 111–12, 188
  phobias, 58, 90–8, 110–12, 120, 129, 131, 149
  totem, 58–9

Animals compared to man, 83, 92, 134, 137, 149, 185
Animism, 58, 106
Anna O., *Fräulein*, case of (*see* Case of *Fräulein Anna O.*)
Anticathexis, 26, 139–41, 145
Anti-Semitism (*see also* Jews), 6–7
Anxiety (*see also* Danger/Danger situation; Trauma; Traumatic situation)
  and birth trauma, 73–5, 83, 115, 118–23, 125, 128, 133–5, 143, 150
  and castration, 73, 96–7, 102, 109–15, 121–3, 126–7, 129, 130–1, 188
  and copulation, 74–5, 78
  and expectation, 73, 146–8
  and separation from mother, 73, 121–3, 133–4, 150–1
  and symptom-formation, 90, 99, 114–15, 125, 128–32
  as affect, 71, 83, 96, 112, 115–19, 124
  as response to danger, 71, 96–8, 111–15, 119–32, 133–7, 143–4, 146–50, 180
  as signal, 72–4, 82, 84, 111–12, 114–15, 119–20, 122–5, 128, 143–4, 147–8, 180
  as transformed libido, 70–2, 74, 97–9, 110–11, 124–5, 142–4
  automatic, 72, 122, 124, 143
  in children, 120–1, 126, 135
  in obsessional neurosis, 70–1, 113–14, 128–30
  in relation to inhibition, 78, 90, 97–8, 111–12, 125, 128
  in relation to repression, 82–3
  moral (social), 113–14, 123, 129
  neurotic and realistic, 71–2, 144, 146–9
  not felt by the superego, 124
  of the id, 124, 142
  physical accompaniments of, 72–4, 117, 119
  preparedness of, 97, 121
  problem of nature of, 63–4, 89, 117–25
  the ego as seat of, 82, 97–9, 111–15, 124–6, 128, 142–4, 147, 150
  use of term, 146 *n.* 1
Anxiety attacks, 21, 75, 83–4, 113, 128, 165
Anxiety dreams, 40
Anxiety hysteria, 99
Anxiety neurosis, 21, 70–2, 74
Aphasia, 15
Aristotle, 10 *n.* 2, 41 *n.* 1
Arousal dreams, 40
Art and psychoanalysis, 56–7, 221
Attention, 175
Auto-erotism (*see also* Masturbation), 30–1, 93, 108–9

Freud's birthplace, Schlossergasse 117 in Příbor (Freiburg)

'I recalled an anecdote I had often heard repeated in my childhood. At the time of my birth an old peasant woman had prophesied to my proud mother that with her first-born child she had brought a great man into the world. Prophecies of this kind must be very common: there are so many mothers filled with happy expectations and so many old peasant women and others of the kind who make up for the loss of their power to control things in the present world by concentrating it on the future.' NOTE ON THE REVISED TRANSLATION

The translations in this *Revised Standard Edition* are supplemented by four sets of notes:

(1) Lengthy commentaries on the English renditions of technical terms that are considered controversial are provided in Volume 24. Usually at the first appearance of each such technical term in each text, but sometimes in other places where the issue seems relevant, the original German word is interpolated in square brackets and a superscript upper-case [T] indicates that the term is discussed in the 24th volume. There (on pp. 55–99) the commentaries appear, in alphabetical order, under the heading 'Notes on the Translation of Some Technical Terms'. If the technical term appears in a derivate form in the text, the root word (as it appears in Volume 24) is provided in the margin. For example, if the interpolated word is the derivative [*überträgt*], the root technical term *Übertragung* appears in the margin.

(2) Shorter commentaries on the English rendition of specific words or phrases appearing in particular places (as opposed to general technical terms) that have attracted comment in the secondary literature are also provided in Volume 24. These minor commentaries are distinguished from those concerning general technical terms by the use of a superscript lower-case [t] in the place where the controversial translation appears. The corresponding set of annotations appears on pp. 105–33 of Volume 24, in chronological order, under the heading 'Annotations to Individual Translations'.

(3) Further interpolations in the translations of German words in square brackets are provided *ad hoc*, without superscript letters, for reasons that should be self-explanatory in each instance. For example, if a technical term which was referenced and discussed in a Note in Volume 24 appears again shortly afterwards in a way that illuminates the points discussed there, then it is silently referenced again. Some of these interpolations might seem odd to German-speaking readers, since no attempt is made to 'adjust' Freud's grammar to conform with the English translation (see the Preface to the Revised Edition, *RSE*, **1**, xxvi *n*. 1). The words in square brackets interpolated in the text are always exactly what Freud wrote.

(4) In a good few places, commentaries (of both types 1 and 2) are also provided in the Editors' introductory notes, appendices and footnotes to the text itself. These are indexed in Volume 24, on pp. 601–6, under the heading 'Notes on Terms and Their Uses'. Such commentaries are usually reserved for matters of translation that are likely to be of interest or value to the general reader, as opposed to those with a special interest in such technical matters.

The pagination of the original *Standard Edition* is provided also in the margins, in square brackets, to assist cross-referencing.

For the reasons explained in the 'Preface to the Revised Edition' (*RSE*, **1**, xxix), all differences between the *SE* and *RSE* are identified through light underscoring of the text. This device was considered necessary to make readers aware of the subtle and pervasive revisions of the translations. The same applies to the revisions of the editorial apparatus. This underscoring will hopefully be removed in later editions of the *RSE*, once the revised edition has become established as the canonical one.

The overarching policy here has been to underscore all differences between the *SE* and *RSE*, with minimal exceptions, in order to ensure transparency. The three categories of exceptions (i.e. the differences that are *not* underscored) are (a) changes that are purely typographical and/or absolutely stereotyped across Volumes 1–23, (b) changes in the location of Freud texts within or between volumes, and (c) all the changes to Volume 24.

The rationale behind (a) is that we wanted to avoid any subjective judgements by the Editor of the *RSE* as to what is and what is not 'significant'. For example, some but not all readers might consider alterations to Strachey's spelling, grammar and punctuation to be trivial, but the potential significance – however subtle – varies with context. The rationale behind (b) is that these changes are indicated in the 'List of Relocated Freud Material in the Revised Edition', which is provided in Volume 24. These changes are also mentioned in the revised (and therefore underscored) editorial notes to the texts themselves. The rationale behind (c) is that the *RSE* version of Volume 24 is so utterly different from the *SE* version that readers can safely consider the volume as a whole to be new.

The following changes were deemed purely typographical and absolutely stereotyped, and are therefore exempted from underscoring:

(1) Changes in type-size, font and spacing (since they are objectively insignificant).

(2) The marginalia – including page numbers – and the superscript ^{T}s and ^{t}s (since they always represent changes).

(3) Changed page numbers in the cross-references and indexes (this follows logically from point 2).

(4) Altered footnote numbers (since new footnotes are always identified by the fact that the notes themselves are underscored, and the knock-on effects for numbering are objectively insignificant).

(5) Changes in running headings (since they repetitively echo changes that are underscored in the main body of text).

(6) Change from the singular possessive 'Editor's' to the plural 'Editors'' (since this applies throughout and follows logically from the fact that, unlike the *SE*, the *RSE* has two editors). In the few instances where the Editor is referred to in the singular, it is always clear from the context whether this means Strachey or Solms or, in the case of Freud (1985*a* [1915]), Grubrich-Simitis.

(7) This preliminary 'Note on the Revised Translation' (since it is obviously added; it applies only to the *RSE*).

(8) Captions to the illustrations (since they always represent changes).

(9) Changes in editorial style (since they are stereotyped and therefore need only be identified once, namely here):

- The word 'and' in two-author citations becomes '&', and a comma is inserted between author name/s and the publication date (e.g. Freud & Breuer, 1895*d*).
- Abbreviations of months (e.g. 'Oct.') and chapters ('Chap.') are spelt out ('October', 'Chapter').
- '*The*' is added to all editorial references to '*Interpretation of Dreams*'.
- Title abbreviations conform to modern usage (e.g. *G.W.* becomes *GW*).
- Punctuation is positioned inside closing quotation marks (e.g. 'The Latin word slipped your memory.').

(10) Modernized hyphenation of words is underscored, but not for those terms that occur very repetitively in the text (since they are stereotyped and the list is limited enough for readers to memorize). Here is the list, which implies also the plural and other grammatical forms of these terms:

anxiety-dream	*becomes*	anxiety dream
anxiety-hysteria	*becomes*	anxiety hysteria
day-dream	*becomes*	daydream
death-wish	*becomes*	death wish
dream-content	*becomes*	dream content
dream-interpretation	*becomes*	dream interpretation
dream-thought	*becomes*	dream thought
ego-cathexis	*becomes*	ego cathexis
ego-libido	*becomes*	ego libido
love-object	*becomes*	love object
object-cathexis	*becomes*	object cathexis
object-choice	*becomes*	object choice
object-libido	*becomes*	object libido
object-love	*becomes*	object love
object-presentation	*becomes*	object presentation
object-relation	*becomes*	object relation
psycho-analysis	*becomes*	psychoanalysis
sound-presentation	*becomes*	sound presentation
super-ego	*becomes*	superego
thing-presentation	*becomes*	thing presentation
to-day	*becomes*	today
wish-fulfilment	*becomes*	wish fulfilment
word-presentation	*becomes*	word presentation

ENGLISH TRANSLATIONS

The Future of an Illusion
1928 London: Hogarth Press and Institute of Psycho-Analysis. Pp. 98. (Tr. W. D. Robson-Scott.)
1961 *SE*, **21**, 5–56. (Tr. J. Strachey, based on the 1928 translation.)
1985 *PFL*, **12**, 179–241. (Reprint of the *SE* translation.)
2004 *PMC*, *Mass Psychology and Other Writings*, 107–64. (Tr. J. A. Underwood.)

The present translation is a revised and corrected reprint of the *SE* version.

This work was begun in the spring of 1927; it was finished by mid-September (possibly as early as August 15) and published in November of the same year (see Grubrich-Simitis, 1993, 194).

In the 'Postscript' which Freud added in 1935 to his *Autobiographical Study* he remarked on 'a significant change' that had come about in his writings during the previous decade. 'My interest', he explained, 'after making a lifelong detour through the natural sciences, medicine and psychotherapy, returned to the cultural problems which had fascinated me long before, when I was a youth scarcely old enough for thinking' (*RSE*, **20**, 64). He had, of course, touched several times on those problems in the intervening years – especially in *Totem and Taboo* (1912–13*a*), ibid., **13**;[1] but it was with *The Future of an Illusion* that he entered on the series of studies which were to be his major concern for the remainder of his life. Of these

1 His earliest published approach to the problem of religion was in the paper on 'Obsessive Actions and Religious Practices' (1907*b*), *RSE*, **9**, 97 ff.

the most important were *Civilization and its Discontents* (1930*a*), which is the direct successor to the present work, the discussion of philosophies of life which forms the last of the *New Introductory Lectures* (1933*a*), *RSE*, **22**, *Why War?* (1933*b*),
[4] ibid., **22**, Freud's open letter to Einstein, and finally *Moses and Monotheism* (1939*a*), ibid., **23**, which he worked at from 1934 onwards.

In view of Freud's sweeping pronouncement on p. 6 below ('I scorn to distinguish between culture and civilization') and of a similar remark towards the end of *Why War?*, it seemed unnecessary to Strachey, in his translation of this work, to embark on the tiresome problem of the proper translation of the German word '*Kultur*'. We have usually, but not invariably, chosen 'civilization' for the noun and 'cultural' for the adjective. For a full discussion of this issue, see *RSE*, **24**, 74.

THE FUTURE OF AN ILLUSION

I

When one has lived for quite a long time in a particular civilization [*Kultur*][T] and has often tried to discover what its origins were and along what path it has developed, one sometimes also feels tempted to take a glance in the other direction and to ask what further fate [*Schicksal*][T] lies before it and what transformations it is destined to undergo. But one soon finds that the value of such an enquiry is diminished from the outset by several factors. Above all, because there are only a few people who can survey human activity in its full compass. Most people have been obliged to restrict themselves to a single, or a few, fields of it. But the less a man knows about the past and the present the more insecure must prove to be his judgement of the future. And there is the further difficulty that precisely in a judgement of this kind the subjective expectations of the individual play a part which it is difficult to assess; and these turn out to be dependent on purely personal factors in his own experience, on the greater or lesser optimism of his attitude to life, as it has been dictated for him by his temperament or by his success or failure. Finally, the curious fact makes itself felt that in general people experience their present naively, as it were, without being able to form an estimate of its contents; they have first to put themselves at a distance from it – the present, that is to say, must have become the past – before it can yield points of vantage from which to judge the future. [5]

Thus anyone who gives way to the temptation to deliver an opinion on the probable future of our civilization will do well to remind himself of the difficulties I have just pointed out, as well as of the uncertainty that attaches quite generally to any prophecy. It follows from this, so far as I am concerned, that I shall make a hasty retreat before a task that is too great, and shall promptly seek out the small tract of territory which has claimed my attention hitherto, as soon as I have determined its position in the general scheme of things.

[6] Human civilization, by which I mean all those respects in which human life has raised itself above its animal status and differs from the life of beasts – and I scorn to distinguish between culture and civilization – presents, as we know, two aspects to the observer. It includes, on the one hand, all the knowledge and capacity that men have acquired in order to control the forces [*Kräfte*][T] of nature and extract its wealth for the satisfaction of human needs, and, on the other hand, all the regulations necessary in order to adjust the relations of men to one another and especially the distribution of the available wealth. The two trends of civilization are not independent of each other: firstly, because the mutual relations of men are profoundly influenced by the amount of
Trieb drive satisfaction [*Triebbefriedigung*][T] which the existing wealth makes possible; secondly, because an individual man can himself come to function as wealth in relation to another one, insofar as the other person makes use of his capacity for work, or chooses him as a sexual object; and thirdly, moreover, because every individual is virtually an enemy of civilization, though civilization is supposed to be an object of universal human interest.[1] It is remarkable that, little as men are able to exist in isolation, they should nevertheless feel as a heavy burden the sacrifices which civilization expects of them in order to make a communal life possible. Thus civilization has to be defended against the individual, and its regulations, institutions and commands are directed to that task. They aim not only at effecting a certain distribution of wealth but at maintaining that distribution; indeed, they have to protect everything that contributes to the conquest of nature and the production of wealth against men's hostile impulses [*Regungen*][T]. Human creations are easily destroyed, and science and technology, which have built them up, can also be used for their annihilation.

One thus gets an impression that civilization is something which was imposed on a resisting majority by a minority which understood how to obtain possession of the means to power [*Macht*] and coercion. It is, of course, natural to assume that these difficulties are not inherent in the nature of civilization itself but are determined by the imperfections of the cultural forms which have so far been developed. And in fact it is
[7] not difficult to indicate those defects. While mankind has made continual advances in its control over nature and may expect to make still greater ones, it is not possible to establish with certainty that a similar

1 [The hostility of human individuals to civilization plays a large part in the earlier chapters of this work. Freud returned to the subject and discussed it more fully still two years later in his *Civilization and its Discontents* (1930*a*); see pp. 79–80, 87–8 and 94 below.]

advance has been made in the management of human affairs; and probably at all periods, just as now once again, many people have asked themselves whether what little civilization has thus acquired is indeed worth defending at all. One would think that a reordering of human relations should be possible, which would remove the sources of dissatisfaction with civilization by renouncing coercion and the suppression of the drives, so that, undisturbed by internal discord, men might devote themselves to the acquisition of wealth and its enjoyment. That would be the golden age, but it is questionable if such a state of affairs can be realized. It seems rather that every civilization must be built up on coercion and renunciation of drive; it does not even seem certain that if coercion were to cease the majority of human beings would be prepared to undertake to perform the work necessary for acquiring new wealth. One has, I think, to reckon with the fact that there are present in all men destructive, and therefore antisocial and anticultural, trends and that in a great number of people these are strong enough to determine their behaviour in human society.

This psychological fact has a decisive importance for our judgement of human civilization. Whereas we might at first think that its essence lies in controlling nature for the purpose of acquiring wealth and that the dangers which threaten it could be eliminated through a suitable distribution of that wealth among men, it now seems that the emphasis has moved over from the material to the mental [*Seelische*][T]. The decisive question is whether and to what extent it is possible to lessen the burden of the sacrifices of drive imposed on men, to reconcile men to those which must necessarily remain and to provide a compensation for them. It is just as impossible to do without control of the mass[1] by a minority as it is to dispense with coercion in the work of civilization. For masses are lazy and unintelligent; they have no love for drive renunciation, and they are not to be convinced by argument of its inevitability; and the individuals composing them support one another in giving free rein to their indiscipline. It is only through the influence [8] of individuals who can set an example and whom masses recognize as their leaders that they can be induced to perform the work and undergo the renunciations on which the existence of civilization depends. All is well if these leaders are persons who possess superior insight into the necessities of life and who have risen to the height of mastering their

Seele

1 [‘*Masse*.’ The German word has a very wide meaning. It is translated ‘group’ for special reasons in Freud’s *Group Psychology* (1921*c*). See *RSE*, **18**, 67 *n*. Here ‘mass’ seems more appropriate. For a full discussion of this issue, see ibid., **24**, 75–7.]

own drive wishes. But there is a danger that in order not to lose their influence they may give way to the mass more than it gives way to them, and it therefore seems necessary that they shall be independent of the mass by having means to power at their disposal. To put it briefly, there are two widespread human characteristics which are responsible for the fact that the regulations of civilization can only be maintained by a certain degree of coercion – namely, that men are not spontaneously fond of work and that arguments are of no avail against their passions.

I know the objections which will be raised against these assertions. It will be said that the characteristic of human masses depicted here, which is supposed to prove that coercion cannot be dispensed with in the work of civilization, is itself only the result of defects in the cultural regulations, owing to which men have become embittered, revengeful and inaccessible. New generations, who have been brought up [*erzogen*] in kindness and taught to have a high opinion of reason, and who have experienced the benefits of civilization at an early age, will have a different attitude to it. They will feel it as a possession of their very own and will be ready for its sake to make the sacrifices as regards work and drive satisfaction that are necessary for its preservation. They will be able to do without coercion and will differ little from their leaders. If no culture has so far produced human masses of such a quality, it is because no culture has yet devised regulations which will influence men in this way, and in particular from childhood onwards.

It may be doubted whether it is possible at all, or at any rate as yet, at the present stage of our control over nature, to set up cultural regulations of this kind. It may be asked where the number of superior, unswerving and disinterested leaders are to come from who are to act as educators [*Erzieher*][T] of the future generations, and it may be alarming to think of the enormous amount of coercion that will inevitably be required before these intentions can be carried out. The grandeur of the plan and its importance for the future of human civilization cannot be disputed. It is securely based on the psychological discovery that man is equipped with the most varied drive dispositions, whose ultimate course is determined by the experiences of early childhood. But for the same reason the limitations of man's capacity for education set bounds to the effectiveness of such a transformation in his culture. One may question whether, and in what degree, it would be possible for a different cultural environment to do away with the two characteristics of human masses which make the guidance of human affairs so difficult. The experiment has not yet been made. Probably a certain percentage

[9]

of mankind (owing to a pathological disposition or an excess of drive strength) will always remain asocial; but if it were feasible merely to reduce the majority that is hostile towards civilization today into a minority, a great deal would have been accomplished – perhaps all that *can* be accomplished.

I should not like to give the impression that I have strayed a long way from the line laid down for my enquiry [p. 5 above]. Let me therefore give an express assurance that I have not the least intention of making judgements on the great experiment in civilization that is now in progress in the vast country that stretches between Europe and Asia.[1] I have neither the special knowledge nor the capacity to decide on its practicability, to test the expediency of the methods employed or to measure the width of the inevitable gap between intention and execution. What is in preparation there is unfinished and therefore eludes an investigation for which our own long-consolidated civilization affords us material.

1 [See, however, some remarks in Chapter V of *Civilization and its Discontents* (1930*a*), p. 100 ff. below, and at two points in *Why War?* (1933*b*), *RSE*, **22**, 221–2, and a long discussion in the last of the *New Introductory Lectures* (1933*a*), ibid., **22**, 157–9.]

II

[10] We have slipped unawares out of the economic field into the field of psychology. At first we were tempted to look for the assets of civilization in the available wealth and in the regulations for its distribution. But with the recognition that every civilization rests on a compulsion to work and a renunciation of drive and therefore inevitably provokes opposition from those affected by these demands, it has become clear that civilization cannot consist principally or solely in wealth itself and the means of acquiring it and the arrangements for its distribution; for these things are threatened by the rebelliousness and destructive mania of the participants in civilization. Alongside of wealth we now come upon the means by which civilization can be defended – measures of coercion and other measures that are intended to reconcile men to it and to recompense them for their sacrifices. These latter may be described as the mental assets of civilization.

For the sake of a uniform terminology we will describe the fact that a drive cannot be satisfied as a 'frustration' [*Versagung*][T], the regulation by which this frustration is established as a 'prohibition' and the condition which is produced by the prohibition as a 'privation'. The first step is to distinguish between privations which affect everyone and privations which do not affect everyone but only groups [*Gruppen*], classes or even single individuals. The former are the earliest; with the prohibitions that established them, civilization – who knows how many thousands of years ago? – began to detach man from his primordial animal condition. We have found to our surprise that these privations are still operative and still form the kernel of hostility to civilization. The drive wishes that suffer under them are born afresh with every child; there is a class of people, the neurotics, who already react to these frustrations with asocial behaviour. Among these drive wishes are those of incest, cannibalism and lust for killing. It sounds strange to place alongside one another wishes which everyone seems united in repudiating and others about which there is so much lively dispute in our civilization as to whether they shall be permitted or frustrated; but psy-
[11] chologically it is justifiable to do so. Nor is the attitude of civilization to these oldest drive wishes by any means uniform. Cannibalism alone seems to be universally proscribed and – to the non-psychoanalytic view – to have been completely surmounted. The strength of the incestuous

wishes can still be detected behind the prohibition against them; and under certain conditions killing is still practised, and indeed commanded, by our civilization. It is possible that cultural developments lie ahead of us in which the satisfaction of yet other wishes, which are entirely permissible today, will appear just as unacceptable as cannibalism does now.

These earliest drive renunciations already involve a psychological factor which remains important for all further drive renunciations as well. It is not true that the human mind has undergone no development since the earliest times and that, in contrast to the advances of science and technology, it is the same today as it was at the beginning of history. We can point out one of these mental advances at once. It is in keeping with the course of human development that external coercion gradually becomes internalized; for a special mental agency, man's superego [*Über-Ich*][T], takes it over and includes it among its commandments.[1] Every child presents this process of transformation to us; only by that means does it become a moral and social being. Such a strengthening of the superego is a most precious cultural asset in the psychological field. Those in whom it has taken place are turned from being opponents of civilization into being its vehicles. The greater their number is in a cultural unit the more secure is its culture and the more it can dispense with external measures of coercion. Now the degree of this internalization differs greatly between the various drive prohibitions. As regards the earliest cultural demands, which I have mentioned, the internalization seems to have been very extensively achieved, if we leave out of account the unwelcome exception of the neurotics. But the case is altered when we turn to the other drive claims. Here we observe with surprise and concern that a majority of people obey the cultural prohibitions on these points only under the pressure of external coercion – that is, only where that coercion can make itself effective and so long as it is to be feared. This is also true of what are known as the *moral* demands of civilization, which likewise apply to everyone. Most of one's [12] experiences of man's moral untrustworthiness fall into this category. There are countless civilized people who would shrink from murder or incest but who do not deny themselves the satisfaction of their avarice, their aggressive urges or their sexual lusts [*Gelüste*][T], and who do not *Lust* hesitate to injure other people by lies, fraud and calumny, so long as they can remain unpunished for it; and this, no doubt, has always been so through many ages of civilization.

1 [See Chapter III of *The Ego and the Id* (1923*b*), *RSE*, **19**, 24 ff.]

If we turn to those restrictions that apply to only certain classes of society, we meet with a state of things which is flagrant and which has always been recognized. It is to be expected that these underprivileged classes will envy the favoured ones their privileges and will do all they can to free themselves from their own surplus of privation. Where this is not possible, a permanent measure of discontent will persist within the culture concerned and this can lead to dangerous revolts. If, however, a culture has not got beyond a point at which the satisfaction of one portion of its participants depends upon the suppression of another, and perhaps larger, portion – and this is the case in all present-day cultures – it is understandable that the suppressed people should develop an intense hostility towards a culture whose existence they make possible by their work, but in whose wealth they have too small a share. In such conditions an internalization of the cultural prohibitions among the suppressed people is not to be expected. On the contrary, they are not prepared to acknowledge the prohibitions, they are intent on destroying the culture itself, and possibly even on doing away with the postulates on which it is based. The hostility of these classes to civilization is so obvious that it has caused the more latent hostility of the social strata that are better provided for to be overlooked. It goes without saying that a civilization which leaves so large a number of its participants unsatisfied and drives them into revolt neither has nor deserves the prospect of a lasting existence.

The extent to which a civilization's precepts have been internalized – to express it popularly and unpsychologically: the moral level of its participants – is not the only form of mental wealth that comes into consideration in estimating a civilization's value. There are in addition its assets in the shape of ideals and artistic creations – that is, the satisfactions that can be derived from those sources.

[13] People will be only too readily inclined to include among the psychical assets of a culture its ideals – its estimates of what achievements are the highest and the most to be striven for. It will seem at first as though these ideals would determine the achievements of the cultural unit; but the actual course of events would appear to be that the ideals are based on the first achievements which have been made possible by a combination of the culture's internal gifts and external circumstances, and that these first achievements are then held on to by the ideal as something to be carried further. The satisfaction which the ideal offers to the participants in the culture is thus of a narcissistic nature; it rests on their pride in what has already been successfully achieved. To make this

satisfaction complete calls for a comparison with other cultures which have aimed at different achievements and have developed different ideals. On the strength of these differences every culture claims the right to look down on the rest. In this way cultural ideals become a source of discord and enmity between different cultural units, as can be seen most clearly in the case of nations.

The narcissistic satisfaction provided by the cultural ideal is also among the forces which are successful in combating the hostility to culture within the cultural unit. This satisfaction can be shared in not only by the favoured classes, which enjoy the benefits of the culture, but also by the suppressed ones, since the right to despise the people outside it compensates them for the wrongs they suffer within their own unit. No doubt one is a wretched plebeian, harassed by debts and military service; but, to make up for it, one is a Roman citizen, one has one's share in the task of ruling other nations and dictating their laws. This identification of the suppressed classes with the class who rules and exploits them is, however, only part of a larger whole. For, on the other hand, the suppressed classes can be emotionally attached to their masters; in spite of their hostility to them they may see in them their ideals; unless such relations of a fundamentally satisfying kind subsisted, it would be impossible to understand how a number of civilizations have survived so long in spite of the justifiable hostility of large human masses.

A different kind of satisfaction is afforded by art to the participants in a cultural unit, though as a rule it remains inaccessible to the masses, who are engaged in exhausting work and have not enjoyed any personal education. As we discovered long since,[1] art offers substitutive satisfactions for the oldest and still most deeply felt cultural renunciations, and for that reason it serves as nothing else does to reconcile a man to the sacrifices he has made on behalf of civilization. On the other hand, the creations of art heighten his feelings of identification, of which every cultural unit stands in so much need, by providing an occasion for sharing highly valued emotional experiences. And when those creations picture the achievements of his particular culture and bring to his mind its ideals in an impressive manner, they also minister to his narcissistic satisfaction. [14]

No mention has yet been made of what is perhaps the most important item in the psychical inventory of a civilization. This consists in its religious ideas in the widest sense – in other words (which will be justified later) in its illusions.

1 [Cf., for instance, 'Creative Writers and Daydreaming' (1908*e*), *RSE*, **9**, 123 ff.]

III

[15] In what does the peculiar value of religious ideas lie?

We have spoken of the hostility to civilization which is produced by the pressure that civilization exercises, the renunciations of drive which it demands. If one imagines its prohibitions lifted – if, then, one may take any woman one pleases as a sexual object, if one may without hesitation kill one's rival for her love or anyone else who stands in one's way, if, too, one can carry off any of the other man's belongings without asking leave – how splendid, what a string of satisfactions one's life would be! True, one soon comes across the first difficulty: everyone else has exactly the same wishes as I have and will treat me with no more consideration than I treat him. And so in reality only one person could be made unrestrictedly happy by such a removal of the restrictions of civilization, and he would be a tyrant, a dictator, who had seized all the means to power. And even he would have every reason to wish that the others would observe at least one cultural commandment: 'thou shalt not kill'.

But how ungrateful, how short-sighted after all, to strive for the abolition of civilization! What would then remain would be a state of nature, and that would be far harder to bear. It is true that nature would not demand any restrictions of drive from us, she would let us do as we liked; but she has her own particularly effective method of restricting us. She destroys us – coldly, cruelly, relentlessly, as it seems to us, and possibly through the very things that occasioned our satisfaction. It was precisely because of these dangers with which nature threatens us that we came together and created civilization, which is also, among other things, intended to make our communal life possible. For the principal task of civilization, its actual raison d'être, is to defend us against nature.

We all know that in many ways civilization does this fairly well already, and clearly as time goes on it will do it much better. But no-one is under the illusion that nature has already been vanquished; and few dare hope that she will ever be entirely subjected to man. There are the elements, which seem to mock at all human control: the earth, which
[16] quakes and is torn apart and buries all human life and its works; water, which deluges and drowns everything in a turmoil; storms, which blow everything before them; there are diseases, which we have only recently recognized as attacks by other organisms; and finally there is the painful

riddle of death, against which no medicine has yet been found, nor probably will be. With these forces nature rises up against us, majestic, cruel and inexorable; she brings to our mind once more our weakness and helplessness, which we thought to escape through the work of civilization. One of the few gratifying and exalting impressions which mankind can offer is when, in the face of an elemental catastrophe, it forgets the discordancies of its civilization and all its internal difficulties and animosities, and recalls the great common task of preserving itself against the superior power of nature.

For the individual, too, life is hard to bear, just as it is for mankind in general. The civilization in which he participates imposes some amount of privation on him, and other men bring him a measure of suffering, either in spite of the precepts of his civilization or because of its imperfections. To this are added the injuries which untamed nature – he calls it Fate [*Schicksal*] – inflicts on him. One might suppose that this condition of things would result in a permanent state of anxious [*ängstlicher*][T] expectation in him and a severe injury to his natural narcissism. We know already how the individual reacts to the injuries which civilization and other men inflict on him: he develops a corresponding degree of resistance to the regulations of civilization and of hostility to it. But how does he defend himself against the superior powers of nature, of Fate, which threaten him as they threaten all the rest? *Angst*

Civilization relieves him of this task; it performs it in the same way for all alike; and it is noteworthy that in this almost all civilizations act alike. Civilization does not call a halt in the task of defending man against nature, it merely pursues it by other means. The task is a manifold one. Man's self-regard, seriously menaced, calls for consolation; life and the universe must be robbed of their terrors; moreover his curiosity, moved, it is true, by the strongest practical interest, demands an answer.

A great deal is already gained with the first step: the humanization of nature. Impersonal forces and destinies cannot be approached; they remain eternally remote. But if the elements have passions that rage as they do in our own souls [*Seele*], if death itself is not something spontaneous but the violent act of an evil Will, if everywhere in nature there are Beings around us of a kind that we know in our own society, then we can breathe freely, can feel at home in the uncanny [*Unheimlichen*] and can deal by psychical means with our senseless anxiety. We are still defenceless, perhaps, but we are no longer helplessly paralysed; we can at least react. Perhaps, indeed, we are not even defenceless. We can [17]

apply the same methods against these violent supermen [*Übermenschen*] outside that we employ in our own society; we can try to adjure them, to appease them, to bribe them, and, by so influencing them, we may rob them of a part of their power. A replacement like this of natural science by psychology not only provides immediate relief, but also points the way to a further mastering of the situation.

For this situation is nothing new. It has an infantile prototype, of which it is in fact only the continuation. For once before one has found oneself in a similar state of helplessness: as a small child, in relation to one's parents. One had reason to fear them, and especially one's father; and yet one was sure of his protection against the dangers one knew. Thus it was natural to assimilate the two situations. Here, too, wishing played its part, as it does in dream life. The sleeper may be seized with a presentiment of death, which threatens to place him in the grave. But the dream-work knows how to select a condition that will turn even that dreaded event into a wish fulfilment: the dreamer sees himself in an ancient Etruscan grave which he has climbed down into, happy to find his archaeological interests satisfied.[1] In the same way, a man makes the forces of nature not simply into persons with whom he can associate as he would with his equals – that would not do justice to the overpowering impression which those forces make on him – but he gives them the character of a father. He turns them into gods, following in this, as I have tried to show,[2] not only an infantile prototype but a phylogenetic one.

In the course of time the first observations were made of regularity and conformity to law in natural phenomena, and with this the forces
[18] of nature lost their human traits. But man's helplessness remains and along with it his longing for his father, and the gods. The gods retain their threefold task: they must exorcize the terrors of nature, they must reconcile men to the cruelty of Fate, particularly as it is shown in death, and they must compensate them for the sufferings and privations which a civilized life in common has imposed on them.

Verschiebung But within these functions there is a gradual displacement [*verschiebt*][T] of accent. It was observed that the phenomena of nature developed automatically according to internal necessities. Without doubt the gods were the lords of nature; they had arranged it to be as it was and now they could leave it to itself. Only occasionally, in what are known as miracles, did they intervene in its course, as though to make it plain that they had

1 [This was an actual dream of Freud's, reported in Chapter VI (G) of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 406.]

2 [See Section 6 of the fourth essay in *Totem and Taboo* (1912–13*a*), ibid., **13**, 135 ff.]

relinquished nothing of their original sphere of power. As regards the apportioning of destinies, an unpleasant suspicion persisted that the perplexity and helplessness of the human race could not be remedied. It was here that the gods were most apt to fail. If they themselves created Fate, then their counsels must be deemed inscrutable. The notion dawned on the most gifted people of antiquity that Moira [Fate] stood above the gods and that the gods themselves had their own destinies. And the more autonomous nature became and the more the gods withdrew from it, the more earnestly were all expectations directed to the third function of the gods – the more did morality become their true domain. It now became the task of the gods to even out the defects and evils of civilization, to attend to the sufferings which men inflict on one another in their life together and to watch over the fulfilment of the precepts of civilization, which men obey so imperfectly. Those precepts themselves were credited with a divine origin; they were elevated beyond human society and were extended to nature and the universe.

And thus a store of ideas is created, born from man's need to make his helplessness tolerable and built up from the material of memories of the helplessness of his own childhood and the childhood of the human race. It can clearly be seen that the possession of these ideas protects him in two directions – against the dangers of nature and Fate, and against the injuries that threaten him from human society itself. Here is the gist of the matter. Life in this world serves a higher purpose; no doubt it is not easy to guess what that purpose is, but it certainly signifies a perfecting of man's nature. It is probably the spiritual [*Geistige*] part of man, the soul [*Seele*], which in the course of time has so slowly [19]
and unwillingly detached itself from the body, that is the object of this elevation and exaltation. Everything that happens in this world is an expression of the intentions of an intelligence superior to us, which in the end, though its ways and byways are difficult to follow, orders everything for the best – that is, to make it enjoyable for us. Over each one of us there watches a benevolent Providence which is only seemingly stern and which will not suffer us to become a plaything of the over-mighty and pitiless forces of nature. Death itself is not extinction, is not a return to inorganic lifelessness, but the beginning of a new kind of existence which lies on the path of development to something higher. And, looking in the other direction, this view announces that the same moral laws which our civilizations have set up govern the whole universe as well, except that they are maintained by a supreme court of justice with incomparably more power and consistency. In the end all good is

rewarded and all evil punished, if not actually in this form of life then in the later existences that begin after death. In this way all the terrors, the sufferings and the hardships of life are destined to be obliterated. Life after death, which continues life on earth just as the invisible part of the spectrum joins on to the visible part, brings us all the perfection that we may perhaps have missed here. And the superior wisdom which directs this course of things, the infinite goodness that expresses itself in it, the justice that achieves its aim in it – these are the attributes of the divine beings who also created us and the world as a whole, or rather, of the one divine being into which, in our civilization, all the gods of antiquity have been condensed. The people which first succeeded in thus concentrating the divine attributes was not a little proud of the advance. It had laid open to view the father who had all along been hidden behind every divine figure as its nucleus. Fundamentally this was a return to the historical beginnings of the idea of God. Now that God was a single person, man's relations to Him could recover the intimacy and intensity of the child's relation to his father. But if one had done so much for one's father, one wanted to have a reward, or at least to be his only beloved child, his Chosen People. Very much later, pious America laid claim to being 'God's own Country';[1] and, as regards one of the shapes in which men worship the deity, the claim is undoubtedly valid.

[20] The religious ideas [*Vorstellungen*][T] that have been summarized above have of course passed through a long process of development and have been adhered to in various phases by various civilizations. I have singled out one such phase, which roughly corresponds to the final form taken by our present-day white Christian civilization. It is easy to see that not all the parts of this picture tally equally well with one another, that not all the questions that press for an answer receive one, and that it is difficult to dismiss the contradiction of daily experience. Nevertheless, such as they are, those ideas – ideas which are religious in the widest sense – are prized as the most precious possession of civilization, as the most precious thing it has to offer its participants. It is far more highly prized than all the devices for winning treasures from the earth or providing men with sustenance or preventing their illnesses, and so forth. People feel that life would not be tolerable if they did not attach to these ideas the value that is claimed for them. And now the question arises: what are these ideas in the light of psychology? Whence do they derive the esteem in which they are held? And, to take a further timid step, what is their real worth?

1 [In English in the original.]

IV

An enquiry which proceeds like a monologue, without interruption, is [21]
not altogether free from danger. One is too easily tempted into pushing aside thoughts which threaten to break into it, and in exchange one is left with a feeling of uncertainty which in the end one tries to keep down by over-decisiveness. I shall therefore imagine that I have an opponent who follows my arguments with mistrust, and here and there I shall allow him to interject some remarks.[1]

I hear him say: 'You have repeatedly used the expressions "civilization creates these religious ideas", "civilization places them at the disposal of its participants". There is something about this that sounds strange to me. I cannot myself say why, but it does not sound so natural as it does to say that civilization has made rules about distributing the products of labour or about rights concerning women and children.'

I think, all the same, that I am justified in expressing myself in this way. I have tried to show that religious ideas have arisen from the same need as have all the other achievements of civilization: from the necessity of defending oneself against the crushingly superior force of nature. To this a second motive [*Motiv*][T] was added – the urge to rectify the shortcomings of civilization which made themselves painfully felt. Moreover, it is especially apposite to say that civilization gives the individual these ideas, for he finds them there already; they are presented to him ready-made, and he would not be able to discover them for himself. What he is entering into is the heritage of many generations, and he takes it over as he does the multiplication table, geometry, and similar things. There is indeed a difference in this, but that difference lies elsewhere and I cannot examine it yet. The feeling of strangeness that you mention may be partly due to the fact that this body of religious ideas is usually put forward as a divine revelation. But this presentation of it is itself a part of the religious system, and it entirely ignores the known historical development of these ideas and their [22]
differences in different epochs and civilizations.

'Here is another point, which seems to me to be more important. You argue that the humanization of nature is derived from the need to put

1 [Freud had adopted the same method of presentation in his recent discussion of lay analysis (1926*e*), *RSE*, **20**, 163 ff., and also, though in somewhat different circumstances, a quarter of a century earlier in his paper on 'Screen Memories' (1899*a*), ibid., **3**, 295 ff.]

an end to man's perplexity and helplessness in the face of its dreaded forces, to get into a relation with them and finally to influence them. But a motive of this kind seems superfluous. Primitive man has no choice, he has no other way of thinking. It is natural to him, something innate, as it were, to project his existence outwards into the world and to regard every event which he observes as the manifestation of beings who at bottom are like himself. It is his only method of comprehension. And it is by no means self-evident, on the contrary it is a remarkable coincidence, if by thus indulging his natural disposition he succeeds in satisfying one of his greatest needs.'

I do not find that so striking. Do you suppose that human thought has no practical motives, that it is simply the expression of a disinterested curiosity? That is surely very improbable. I believe rather that when man personifies the forces of nature he is again following an infantile model. He has learnt from the persons in his earliest environment that the way to influence them is to establish a relation with them; and so, later on, with the same end in view, he treats everything else that he comes across in the same way as he treated those persons. Thus I do not contradict your descriptive observation; it is in fact natural to man to personify everything that he wants to understand in order later to control it (psychical mastering as a preparation for physical mastering); but I provide in addition a motive and a genesis for this peculiarity of human thinking.

'And now here is yet a third point. You have dealt with the origin of religion once before, in your book *Totem and Taboo* [1912–13*a*]. But there it appeared in a different light. Everything was the son–father relationship. God was the exalted father, and the longing for the father was the root of the need for religion. Since then, it seems, you have discovered the factor of human weakness and helplessness, to which indeed the chief role in the formation of religion is generally assigned, and now you transpose everything that was once the father complex into terms of helplessness. May I ask you to explain this transformation?'

[23] With pleasure. I was only waiting for this invitation. But is it really a transformation? In *Totem and Taboo* it was not my purpose to explain the origin of religions but only of totemism. Can you, from any of the views known to you, explain the fact that the first shape in which the protecting deity revealed itself to men should have been that of an animal, that there was a prohibition against killing and eating this animal and that nevertheless the solemn custom was to kill and eat it communally once a year? This is precisely what happens in totemism.

And it is hardly to the purpose to argue about whether totemism ought to be called a religion. It has intimate connections with the later god religions. The totem animals become the sacred animals of the gods; and the earliest, but most fundamental moral restrictions – the prohibitions against murder and incest – originate in totemism. Whether or not you accept the conclusions of *Totem and Taboo*, I hope you will admit that a number of very remarkable, disconnected facts are brought together in it into a consistent whole.

The question of why in the long run the animal god did not suffice, and was replaced by a human one, was hardly touched on in *Totem and Taboo*, and other problems concerning the formation of religion were not mentioned in the book at all. Do you regard a limitation of that kind as the same thing as a denial? My work is a good example of the strict isolation of the particular contribution which psychoanalytic discussion can make to the solution to the problem of religion. If I am now trying to add the other, less deeply concealed part, you should not accuse me of contradicting myself, just as before you accused me of being one-sided. It is, of course, my duty to point out the connecting links between what I said earlier and what I put forward now, between the deeper and the manifest motives, between the father complex and man's helplessness and need for protection.

These connections are not hard to find. They consist in the relation of the child's helplessness to the helplessness of the adult which continues it. So that, as was to be expected, the motives for the formation of religion which psychoanalysis revealed now turn out to be the same as the infantile contribution to the *manifest* motives. Let us transport ourselves into the mental life of a child. You remember the choice of object according to the anaclitic type [*Anlehnungstypus*][T], which psychoanalysis talks of?[1] The libido there follows the paths of narcissistic needs and attaches [*heftet*] itself to the objects which ensure the satisfaction of those needs. In this way the mother, who satisfies the child's hunger, becomes its first love object and certainly also its first protection against all the undefined dangers which threaten it in the external world – its first protection against anxiety, we may say. *Anlehnung* [24]

In this function [of protection] the mother is soon replaced by the stronger father, who retains that position for the rest of childhood. But the child's attitude to its father is coloured by a peculiar ambivalence. The father himself constitutes a danger for the child, perhaps because of its earlier relation to its mother. Thus it fears him no less than it longs for

1 [See Freud's paper on narcissism (1914*c*), *RSE*, **14**, 76.]

him and admires him. The indications of this ambivalence in the attitude to the father are deeply imprinted in every religion, as was shown in *Totem and Taboo*. When the growing individual finds that he is destined to remain a child for ever, that he can never do without protection against strange superior powers, he lends those powers the features belonging to the figure of his father; he creates for himself the gods whom he dreads, whom he seeks to propitiate, and whom he nevertheless entrusts with his own protection. Thus his longing for a father is a motive identical to his need for protection against the consequences of his human weakness. The defence [*Abwehr*][T] against childish helplessness is what lends its characteristic features to the adult's reaction to the helplessness which *he* has to acknowledge – a reaction which is precisely the formation of religion. But it is not my intention to enquire any further into the development of the idea of God; what we are concerned with here is the finished body of religious ideas as it is transmitted by civilization to the individual.

V

Let us now take up the thread of our enquiry.[1] What, then, is the psychological significance of religious ideas and under what heading are we to classify them? The question is not at all easy to answer immediately. After rejecting a number of formulations, we will take our stand on the following one. Religious ideas are teachings and assertions about facts and conditions of external (or internal) reality which tell one something one has not discovered for oneself and which lay claim to one's belief. Since they give us information about what is most important and interesting to us in life, they are particularly highly prized. Anyone who knows nothing of them is very ignorant; and anyone who has added them to his knowledge may consider himself much the richer. [25]

There are, of course, many such teachings about the most various things in the world. Every school lesson is full of them. Let us take geography. We are told that the town of Constance lies on the Bodensee.[2] A student song adds: 'if you don't believe it, go and see.' I happen to have been there and can confirm the fact that that lovely town lies on the shore of a wide stretch of water which all those who live round it call the Bodensee; and I am now completely convinced of the correctness of this geographical assertion. In this connection I am reminded of another, very remarkable, experience. I was already a man of mature years when I stood for the first time on the hill of the Acropolis in Athens, between the temple ruins, looking out over the blue sea. A feeling of astonishment mingled with my joy. It seemed to say: 'So it really *is* true, just as we learnt at school!' How shallow and weak must have been the belief I then acquired in the real truth of what I heard, if I could be so astonished now! But I will not lay too much stress on the significance of this experience; for my astonishment could have had another explanation, which did not occur to me at the time and which is of a wholly subjective nature and has to do with the special character of the place.[3]

All teachings like these, then, demand belief in their contents, but not [26] without producing grounds for their claim. They are put forward as the epitomized result of a longer process of thought based on observation

1 [From the end of Chapter III, p. 18 above.]

2 [The German name for what we call the Lake of Constance.]

3 [This had happened in 1904, when Freud was almost fifty. He wrote a full account of the episode in an open letter to Romain Rolland some ten years after the present work (1936*a*), *RSE*, **22**, 255 f.]

and certainly also on inferences. If anyone wants to go through this process himself instead of accepting its result, they show him how to set about it. Moreover, we are always in addition given the source of the knowledge conveyed by them, where that source is not self-evident, as it is in the case of geographical assertions. For instance, the earth is shaped like a sphere; the proofs adduced for this are Foucault's pendulum experiment,[1] the behaviour of the horizon and the possibility of circumnavigating the earth. Since it is impracticable, as everyone concerned realizes, to send every schoolchild on a voyage round the world, we are satisfied with letting what is taught at school be taken on trust; but we know that the path to acquiring a personal conviction remains open.

Let us try to apply the same test to the teachings of religion. When we ask on what their claim to be believed is founded, we are met with three answers, which harmonize remarkably badly with one another. Firstly, these teachings deserve to be believed because they were already believed by our primal ancestors; secondly, we possess proofs which have been handed down to us from those same primaeval times; and thirdly, it is forbidden to raise the question of their authentication at all. In former days anything so presumptuous was visited with the severest penalties, and even today society looks askance at any attempt to raise the question again.

This third point is bound to rouse our strongest suspicions. After all, a prohibition like this can only be for one reason – that society is very well aware of the insecurity of the claim it makes on behalf of its religious doctrines. Otherwise it would certainly be very ready to put the necessary data at the disposal of anyone who wanted to arrive at conviction. This being so, it is with a feeling of mistrust which it is hard to allay that we pass on to an examination of the other two grounds of proof. We ought to believe because our forefathers believed. But these
[27] ancestors of ours were far more ignorant than we are. They believed in things we could not possibly accept today; and the possibility occurs to us that the doctrines of religion may belong to that class too. The proofs they have left us are set down in writings which themselves bear every mark of untrustworthiness. They are full of contradictions, revisions and falsifications, and where they speak of factual confirmations they are themselves unconfirmed. It does not help much to have it asserted that their wording, or even their content only, originates from divine

1 [J. B. L. Foucault (1819–68) demonstrated the diurnal motion of the earth by means of a pendulum in 1851.]

revelation; for this assertion is itself one of the doctrines whose authenticity is under examination, and no proposition can be a proof of itself.

Thus we arrive at the singular conclusion that of all the information provided by our cultural assets it is precisely the elements which might be of the greatest importance to us and which have the task of solving the riddles of the universe and of reconciling us to the sufferings of life – it is precisely those elements that are the least well authenticated of any. We should not be able to bring ourselves to accept anything of so little concern to us as the fact that whales bear young instead of laying eggs, if it were not capable of better proof than this.

This state of affairs is in itself a very remarkable psychological problem. And let no-one suppose that what I have said about the impossibility of proving the truth of religious doctrines contains anything new. It has been felt at all times – undoubtedly, too, by the ancestors who bequeathed us this legacy. Many of them probably nourished the same doubts as ours, but the pressure imposed on them was too strong for them to have dared to utter them. And since then countless people have been tormented by similar doubts, and have striven to suppress them, because they thought it was their duty to believe; many brilliant intellects have broken down over this conflict, and many characters have been impaired by the compromises with which they have tried to find a way out of it.

If all the evidence put forward for the authenticity of religious teachings originates in the past, it is natural to look round and see whether the present, about which it is easier to form judgements, may not also be able to furnish evidence of the sort. If by this means we could succeed in clearing even a single portion of the religious system from doubt, the whole of it would gain enormously in credibility. The proceedings of the spiritualists meet us at this point; they are convinced of the survival [28]
of the individual soul [*Seele*] and they seek to demonstrate to us beyond doubt the truth of this one religious doctrine. Unfortunately they cannot succeed in refuting the fact that the appearance and utterances of their spirits [*Geister*] are merely the products of their own mental activity [*Seelentätigkeit*]. They have called up the spirits of the greatest men and of the most eminent thinkers, but all the pronouncements and information which they have received from them have been so foolish and so wretchedly meaningless that one can find nothing credible in them but the capacity of the spirits to adapt themselves to the circle of people who have conjured them up.

I must now mention two attempts that have been made – both of which convey the impression of being desperate efforts – to evade the problem. One, of a violent nature, is ancient; the other is subtle and modern. The first is the '*Credo quia absurdum*' of the early Father of the Church.[1] It maintains that religious doctrines are outside the jurisdiction of reason – are above reason. Their truth must be felt inwardly, and they need not be comprehended. But this *Credo* is only of interest as a self-confession. As an authoritative statement it has no binding force. Am I to be obliged to believe *every* absurdity? And if not, why this one in particular? There is no appeal to a court above that of reason. If the truth of religious doctrines is dependent on an inner experience which bears witness to that truth, what is one to do about the many people who do not have this rare experience? One may require every man to use the gift of reason which he possesses, but one cannot erect, on the basis of a motive that exists only for a very few, an obligation that shall apply to everyone. If one man has gained an unshakeable conviction of the true reality of religious doctrines from a state of ecstasy which has deeply moved him, of what significance is that to others?

The second attempt is the one made by the philosophy of 'as if'. This asserts that our thought activity includes a great number of hypotheses whose groundlessness and even absurdity we fully realize. They are called 'fictions', but for a variety of practical reasons we have to behave 'as if' we believed in these fictions. This is the case with religious doctrines because of their incomparable importance for the maintenance
[29] of human society.[2] This line of argument is not far removed from the '*Credo quia absurdum*'. But I think the demand made by the 'as if' argument is one that only a philosopher could put forward. A man whose thinking is not influenced by the artifices of philosophy will never be able to accept it; in such a man's view, the admission that something is absurd or contrary to reason leaves no more to be said. It cannot be expected of him that precisely in treating his most important interests he shall forgo the guarantees he requires for all his ordinary activities. I am reminded of one of my children who was distinguished at an early age by a peculiarly marked matter-of-factness. When the children were

1 ['I believe because it is absurd.' This is attributed to Tertullian.]

2 I hope I am not doing him an injustice if I take the philosopher of 'as if' as the representative of a view which is not foreign to other thinkers: 'We include as fictions not merely indifferent theoretical operations but ideational constructs emanating from the noblest minds, to which the noblest part of mankind cling and of which they will not allow themselves to be deprived. Nor is it our object so to deprive them – for as *practical fictions* we leave them all intact; they perish only as *theoretical truths*.' (Hans Vaihinger, 1922, 68 [C. K. Ogden's translation, 1924, 48–9].)

being told a fairy tale and were listening to it with rapt attention, he would come up and ask: 'Is that a true story?' When he was told it was not, he would turn away with a look of disdain. We may expect that people will soon behave in the same way towards the fairy tales of religion, in spite of the advocacy of 'as if'.

But at present they still behave quite differently; and in past times religious ideas, in spite of their incontrovertible lack of authentication, have exercised the strongest possible influence on mankind. This is a fresh psychological problem. We must ask where the inner force of those doctrines lies and to what it is that they owe their efficacy, independent as it is of recognition by reason.

VI

[30] I think we have prepared the way sufficiently for an answer to both these questions. It will be found if we turn our attention to the psychical origin of religious ideas. These, which are given out as teachings, are not precipitates of experience or end results of thinking: they are illusions, fulfilments of the oldest, strongest and most urgent wishes of mankind. The secret of their strength lies in the strength of those wishes. As we already know, the terrifying impression of helplessness in childhood aroused the need for protection – for protection through love – which was provided by the father; and the recognition that this helplessness lasts throughout life made it necessary to cling to the existence of a father, but this time a more powerful one. Thus the benevolent rule of a divine Providence allays our fear of the dangers of life; the establishment of a moral world order ensures the fulfilment of the demands of justice, which have so often remained unfulfilled in human civilization; and the prolongation of earthly existence in a future life provides the local and temporal framework in which these wish fulfilments shall take place. Answers to the riddles that tempt the curiosity of man, such as how the universe began or what the relation is between body and mind, are developed in conformity with the underlying assumptions of this system. It is an enormous relief to the individual psyche if the conflicts of its childhood arising from the father complex – conflicts which it has never wholly overcome – are removed from it and brought to a solution which is universally accepted.

When I say that these things are all illusions, I must define the meaning of the word. An illusion is not the same thing as an error; nor is it necessarily an error. Aristotle's belief that vermin are developed out of dung (a belief to which ignorant people still cling) was an error; so was the belief of a former generation of doctors that *tabes dorsalis* is the result of sexual excess. It would be incorrect to call these errors illusions. On the other hand, it was an illusion of Columbus's that he had discovered a new sea route to the Indies. The part played by his wish in this error is very clear. One may describe as an illusion the assertion
[31] made by certain nationalists that the Indo-Germanic race is the only one capable of civilization; or the belief, which was only destroyed by psychoanalysis, that children are creatures without sexuality. What is characteristic of illusions is that they are derived from human wishes.

In this respect they come near to psychiatric delusions. But they differ from them, too, apart from the more complicated structure [*Aufbau*][T] of delusions. In the case of delusions, we emphasize as essential their being in contradiction with reality. Illusions need not necessarily be false – that is to say, unrealizable or in contradiction to reality. For instance, a middle-class girl may have the illusion that a prince will come and marry her. This is possible; and a few such cases have occurred. That the Messiah will come and found a golden age is much less likely. Whether one classifies this belief as an illusion or as something analogous to a delusion will depend on one's personal attitude. Examples of illusions which have proved true are not easy to find, but the illusion of the alchemists that all metals can be turned into gold might be one of them. The wish to have a great deal of gold, as much gold as possible, has, it is true, been a good deal damped by our present-day knowledge of the determinants of wealth, but chemistry no longer regards the transmutation of metals into gold as impossible. Thus we call a belief an illusion when a wish fulfilment is a prominent factor in its motivation, and in doing so we disregard its relations to reality, just as the illusion itself sets no store by verification.

Having thus taken our bearings, let us return once more to the question of religious doctrines. We can now repeat that all of them are illusions and insusceptible to proof. No-one can be compelled to think them true, to believe in them. Some of them are so improbable, so incompatible with everything we have laboriously discovered about the reality of the world, that we may compare them – if we pay proper regard to the psychological differences – to delusions. Of the reality value of most of them we cannot judge; just as they cannot be proved, so they cannot be refuted. We still know too little to make a critical approach to them. The riddles of the universe reveal themselves only slowly to our investigation; there are many questions to which science today can give no answer. But scientific work is the only road which can lead us to a knowledge of reality outside ourselves. It is once again merely an illusion to expect anything from intuition and introspection; they can give us nothing but particulars about our own mental life, [32]
which are hard to interpret, never any information about the questions which religious doctrine finds it so easy to answer. It would be insolent to let one's own arbitrary will step into the breach and, according to one's personal estimate, declare this or that part of the religious system to be less or more acceptable. Such questions are too momentous for that; they might be called too sacred.

At this point one must expect to meet with an objection. 'Well then, if even obdurate sceptics admit that the assertions of religion cannot be refuted by reason, why should I not believe in them, since they have so much on their side – tradition, the agreement of mankind, and all the consolations they offer?' Why not, indeed? Just as no-one can be forced to believe, so no-one can be forced to disbelieve. But do not let us be satisfied with deceiving ourselves that arguments like these take us along the road of correct thinking. If ever there was a case of a lame excuse we have it here. Ignorance is ignorance; no right to believe anything can be derived from it. In other matters no sensible person will behave so irresponsibly or rest content with such feeble grounds for his opinions and for the line he takes. It is only in the highest and most sacred things that he allows himself to do so. In reality these are only attempts at pretending to oneself or to other people that one is still firmly attached to religion, when one has long since cut oneself loose from it. Where questions of religion are concerned, people are guilty of every possible sort of dishonesty and intellectual misdemeanour. Philosophers stretch the meaning of words until they retain scarcely anything of their original sense. They give the name of 'God' to some vague abstraction which they have created for themselves; having done so they can pose before all the world as deists, as believers in God, and they can even boast that they have recognized a higher, purer concept of God, notwithstanding that their God is now nothing more than an insubstantial shadow and no longer the mighty personality of religious doctrines. Critics persist in describing as 'deeply religious' anyone who admits to a sense of man's insignificance or impotence in the face of the universe, although what constitutes the essence of the religious attitude is not this feeling but only the next step after it, the reaction to it which seeks a remedy for it. The man who goes no further, but humbly acquiesces in
[33] the small part which human beings play in the great world – such a man is, on the contrary, irreligious in the truest sense of the word.

To assess the truth value of religious doctrines does not lie within the scope of the present enquiry. It is enough for us that we have recognized them as being, in their psychological nature, illusions. But we do not have to conceal the fact that this discovery also strongly influences our attitude to the question which must appear to many to be the most important of all. We know approximately at what periods and by what kind of men religious doctrines were created. If in addition we discover the motives which led to this, our attitude to the problem of religion will undergo a marked displacement [*Verschiebung*]. We shall tell

ourselves that it would be very nice if there were a God who created the world and was a benevolent Providence, and if there were a moral order in the universe and an afterlife; but it is a very striking fact that all this is exactly as we are bound to wish it to be. And it would be more remarkable still if our wretched, ignorant and downtrodden ancestors had succeeded in solving all these difficult riddles of the universe.

VII

[34] Having recognized religious doctrines as illusions, we are at once faced with a further question: may not other cultural assets of which we hold a high opinion and by which we let our lives be ruled be of a similar nature? Must not the assumptions that determine our political regulations be called illusions as well? and is it not the case that in our civilization the relations between the sexes are disturbed by an erotic illusion or a number of such illusions? And once our suspicion has been aroused, we shall not shrink from asking too whether our conviction that we can learn something about external reality through the use of observation and reasoning in scientific work – whether this conviction has any better foundation. Nothing ought to keep us from directing our observation to our own selves or from applying our thought to criticism of itself. In this field a number of investigations open out before us, whose results could not but be decisive for the construction [*Aufbau*] of a '*Weltanschauung*'. We surmise, moreover, that such an effort would not be wasted and that it would at least in part justify our suspicion. But the author does not dispose of the means for undertaking so comprehensive a task; he needs must confine his work to following out one only of these illusions – that, namely, of religion.

But now the loud voice of our opponent brings us to a halt. We are called to account for our wrongdoing:

'Archaeological interests are no doubt most praiseworthy, but no-one undertakes an excavation if by doing so he is going to undermine the habitations of the living so that they collapse and bury people under their ruins. The doctrines of religion are not a subject one can quibble about like any other. Our civilization is built up on them, and the maintenance of human society is based on the majority of men's believing in the truth of those doctrines. If men are taught that there is no almighty and all-just God, no divine world order and no future life, they will feel exempt from all obligation to obey the precepts of civilization. Every-
Hemmung one will, without inhibition [*ungehemmt*][T] or fear, follow his asocial, egoistic [*egoistischen*] drives and seek to exercise his power; Chaos, which we have banished through many thousands of years of the work
[35] of civilization, will come again. Even if we knew, and could prove, that religion was not in possession of the truth, we ought to conceal the fact and behave in the way prescribed by the philosophy of "as if" – and this

in the interest of the preservation of us all. And apart from the danger of the undertaking, it would be a purposeless cruelty. Countless people find their one consolation in religious doctrines, and can only bear life with their help. You would rob them of their support, without having anything better to give them in exchange. It is admitted that so far science has not achieved much, but even if it had advanced much further it would not suffice for man. Man has imperative needs of another sort, which can never be satisfied by cold science; and it is very strange – indeed, it is the height of inconsistency – that a psychologist who has always insisted on what a minor part is played in human affairs by the intelligence as compared with the life of the drives – that such a psychologist should now try to rob mankind of a precious wish fulfilment and should propose to compensate them for it with intellectual nourishment.'

What a lot of accusations all at once! Nevertheless, I am ready with rebuttals for them all; and, what is more, I shall assert the view that civilization runs a greater risk if we maintain our present attitude to religion than if we give it up.

But I hardly know where to begin my reply. Perhaps with the assurance that I myself regard my undertaking as completely harmless and free of risk. It is not I who am overvaluing the intellect this time. If people are as my opponents describe them – and I should not like to contradict them – then there is no danger of a devout believer's being overcome by my arguments and deprived of his faith. Besides, I have said nothing which other and better men have not said before me in a much more complete, forcible and impressive manner. Their names are well known, and I shall not cite them, for I should not like to give an impression that I am seeking to rank myself as one of them. All I have done – and this is the only thing that is new in my exposition – is to add some psychological foundation to the criticisms of my great predecessors. It is hardly to be expected that precisely this addition will produce the effect which was denied to those earlier efforts. No doubt I might be asked here what is the point of writing these things if I am certain that they will be ineffective. But I shall come back to that later.

The one person this publication may injure is myself. I shall have to [36]
listen to the most disagreeable reproaches for my shallowness, narrow-mindedness and lack of idealism or of understanding for the highest interests of mankind. But on the one hand, such remonstrances are not new to me; and on the other, if a man has already learnt in his youth to rise superior to the disapproval of his contemporaries, what can it

matter to him in his old age when he is certain soon to be beyond the reach of all favour or disfavour? In former times it was different. Then utterances such as mine brought with them a sure curtailment of one's earthly existence and an effective speeding up of the opportunity for gaining a personal experience of the afterlife. But, I repeat, those times are past, and today writings such as this bring no more danger to their author than to their readers. The most that can happen is that the translation and distribution of his book will be forbidden in one country or another – and precisely, of course, in a country that is convinced of the high standard of its culture. But if one puts in any plea at all for the renunciation of wishes and for acquiescence in Fate, one must be able to tolerate this kind of injury too.

The further question occurred to me whether the publication of this work might not after all do harm. Not to a person, however, but to a cause – the cause of psychoanalysis. For it cannot be denied that psychoanalysis is my creation, and it has met with plenty of mistrust and ill-will. If I now come forward with such displeasing pronouncements, people will be only too ready to make a displacement from my person to psychoanalysis. 'Now we see,' they will say, 'where psychoanalysis leads to. The mask has fallen; it leads to a denial of God and of a moral ideal, as we always suspected. To keep us from this discovery we have been deluded into thinking that psychoanalysis has no *Weltanschauung* and never can construct one.'[1]

An outcry of this kind will really be disagreeable to me on account of my many fellow workers, some of whom do not by any means share my attitude to the problems of religion. But psychoanalysis has already weathered many storms and now it must brave this fresh one. In point of fact, psychoanalysis is a method of research, an impartial instrument, like the infinitesimal calculus, as it were. If a physicist were to discover with the latter's help that after a certain time the earth would be
[37] destroyed, we would nevertheless hesitate to attribute destructive tendencies to the calculus itself and therefore to proscribe it. Nothing that I have said here against the truth value of religions needed the support of psychoanalysis; it had been said by others long before analysis came into existence. If the application of the psychoanalytic method makes it possible to find a new argument against the truths of religion, *tant pis* for religion; but defenders of religion will by the same right make use of psychoanalysis in order to give full value to the affective significance of religious doctrines.

1 [See some remarks in Chapter II of *Inhibitions, Symptoms and Anxiety* (1926*d*), *RSE*, **20**, 85.]

And now to proceed with our defence. Religion has clearly performed great services for human civilization. It has contributed much towards the taming of the asocial drives. But not enough. It has ruled human society for many thousands of years and has had time to show what it can achieve. If it had succeeded in making the majority of mankind happy, in comforting them, in reconciling them to life and in making them into vehicles of civilization, no-one would dream of attempting to alter the existing conditions. But what do we see instead? We see that an appallingly large number of people are dissatisfied with civilization and unhappy in it, and feel it as a yoke which must be shaken off; and that these people either do everything in their power to change that civilization, or else go so far in their hostility to it that they will have nothing to do with civilization or with a restriction of drive. At this point it will be objected against us that this state of affairs is due to the very fact that religion has lost a part of its influence over human masses precisely because of the deplorable effect of the advances of science. We will note this admission and the reason given for it, and we shall make use of it later for our own purposes; but the objection itself has no force.

It is doubtful whether men were in general happier at a time when religious doctrines held unrestricted sway; more moral they certainly were not. They have always known how to externalize the precepts of religion and thus to nullify their intentions. The priests, whose duty it was to ensure obedience to religion, met them halfway in this. God's kindness must lay a restraining hand on His justice. One sinned, and then one made a sacrifice or did penance and then one was free to sin once more. Russian introspectiveness has reached the pitch of concluding that sin is indispensable for the enjoyment of all the blessings of [38]
divine grace, so that, at bottom, sin is pleasing to God. It is no secret that the priests could only keep the masses submissive to religion by making such large concessions as these to the nature of the drives of man. Thus it was agreed: God alone is strong and good, man is weak and sinful. In every age immorality has found no less support in religion than morality has. If the achievements of religion in respect to man's happiness, susceptibility to culture[1] and moral control are no better than this, the question cannot but arise whether we are not overrating its necessity for mankind, and whether we do wisely in basing our cultural demands upon it.

1 [The nature of 'susceptibility to culture' had been discussed by Freud in the first section of his paper on 'War and Death' (1915*b*), *RSE*, **14**, 282, and a similar term, 'readiness for culture', occurs in Chapter VIII of *An Outline of Psychoanalysis* (1940*a* [1938]), ibid., **23**, 181.]

Let us consider the unmistakable situation as it is today. We have heard the admission that religion no longer has the same influence on people that it used to. (We are here concerned with European Christian civilization.) And this is not because its promises have grown less but because people find them less credible. Let us admit that the reason – though perhaps not the only reason – for this change is the increase of the scientific spirit [*Geistes*] in the higher strata of human society. Criticism has whittled away the evidential value of religious documents, natural science has shown up the errors in them, and comparative research has been struck by the fatal resemblance between the religious ideas which we revere and the mental [*geistigen*] products of primitive peoples and times.

The scientific spirit brings about a particular attitude towards worldly matters; before religious matters it pauses for a little, hesitates, and finally there too crosses the threshold. In this process there is no stopping; the greater the number of men to whom the treasures of knowledge become accessible, the more widespread is the falling away from religious belief – at first only from its obsolete and objectionable trappings, but later from its fundamental postulates as well. The Americans who instituted the 'monkey trial' at Dayton[1] have alone shown themselves consistent. Elsewhere the inevitable transition is accomplished by way of half-measures and insincerities.

[39] Civilization has little to fear from educated people and intellectuals.[2] In them the replacement of religious motives for civilized behaviour by other, secular motives would proceed unobtrusively; moreover, such people are to a large extent themselves vehicles of civilization. But it is another matter with the great mass of the uneducated and oppressed, who have every reason for being enemies of civilization. So long as they do not discover that people no longer believe in God, all is well. But they will discover it, infallibly, even if this piece of writing of mine is not published. And they are ready to accept the results of scientific thinking, but without the change having taken place in them which scientific thinking brings about in people. Is there not a danger here that the hostility of these masses to civilization will throw itself against the weak spot that they have found in their task-mistress [*Zwangsherrin*]? If the sole reason why you must not kill your neighbour is because God has forbidden it and will severely punish you for it in this or the next

1 [A small town in Tennessee where, in 1925, a science teacher was prosecuted for breach of a State law by teaching that 'man is descended from the lower animals'.]

2 [*geistigen Arbeitern*, literally 'mental workers'. Translated 'brain-workers' in the *SE*.]

life – then, when you learn that there is no God and that you need not fear His punishment, you will certainly kill your neighbour without hesitation, and you can only be prevented from doing so by mundane force. Thus either these dangerous masses must be held down most severely and kept most carefully away from any chance of intellectual awakening, or else the relationship between civilization and religion must undergo a fundamental revision.

VIII

[40] One might think that there would be no special difficulties in the way of carrying out this latter proposal. It is true that it would involve a certain amount of renunciation, but more would perhaps be gained than lost, and a great danger would be avoided. Everyone is frightened of it, however, as though it would expose civilization to a still greater danger. When St Boniface[1] cut down the tree that was venerated as sacred by the Saxons the bystanders expected some fearful event to follow upon the sacrilege. But nothing happened, and the Saxons accepted baptism.

When civilization laid down the commandment that a man shall not kill the neighbour whom he hates or who is in his way or whose property he covets, this was clearly done in the interest of man's communal existence, which would not otherwise be practicable. For the murderer would draw down on himself the vengeance of the murdered man's kinsmen and the secret envy of others, who within themselves feel as much inclined as he does for such acts of violence. Thus he would not enjoy his revenge or his robbery for long, but would have every prospect of soon being killed himself. Even if he protected himself against his single foes by extraordinary strength and caution, he would be bound to succumb to a combination of weaker men. If a combination of this sort did not take place, the murdering would continue endlessly and the final outcome would be that men would exterminate one another. We should arrive at the same state of affairs between individuals as still persists in Corsica between families, though elsewhere only between nations. Insecurity of life, which is an equal danger for everyone, now unites men into a society which prohibits the individual from killing and reserves to itself the right to communal killing of anyone who violates the prohibition. Here, then, we have justice and punishment.

But we do not publish this rational explanation of the prohibition against murder. We assert that the prohibition has been issued by God. Thus we take it upon ourselves to guess His intentions, and we find that
[41] He, too, is unwilling for men to exterminate one another. In behaving in this way we are investing the cultural prohibition with a quite special solemnity, but at the same time we risk making its observance dependent on belief in God. If we retrace this step – if we no longer attribute to

1 [The eighth-century, Devonshire-born, 'Apostle of Germany'.]

God what is our own will and if we content ourselves with giving the social reason – then, it is true, we have renounced the transfiguration of the cultural prohibition, but we have also avoided the risk to it. But we gain something else as well. Through some kind of diffusion or infection, the character of sanctity and inviolability – of belonging to another world, one might say – has spread from a few major prohibitions on to every other cultural regulation, law and ordinance. But on these the halo often looks far from becoming: not only do they invalidate one another by giving contrary decisions at different times and places, but apart from this they show every sign of human inadequacy. It is easy to recognize in them things that can only be the product of short-sighted apprehensiveness or an expression of selfishly narrow interests or a conclusion based on insufficient premises. The criticism which we cannot fail to level at them also diminishes to an unwelcome extent our respect for other, more justifiable cultural demands. Since it is an awkward task to separate what God Himself has demanded from what can be traced to the authority of an all-powerful parliament or a high judiciary, it would be an undoubted advantage if we were to leave God out altogether and honestly admit the purely human origin of all the regulations and precepts of civilization. Along with their pretended sanctity, these commandments and laws would lose their rigidity and unchangeableness as well. People could understand that they are made, not so much to rule them as, on the contrary, to serve their interests; and they would adopt a more friendly attitude to them, and instead of aiming at their abolition, would aim only at their improvement. This would be an important advance along the road which leads to becoming reconciled to the burden of civilization.

But here our plea for ascribing purely rational reasons to the precepts of civilization – that is to say, for deriving them from social necessity – is interrupted by a sudden doubt. We have chosen as our example the origin of the prohibition against murder. But does our account of it tally with historical truth? We fear not; it appears to be nothing but a rationalistic construction. With the help of psychoanalysis, we have made a [42]
study of precisely this piece of the cultural history of mankind,[1] and, basing ourselves on it, we are bound to say that in reality things happened otherwise. Even in present-day man purely reasonable motives can effect little against passionate impulsions. How much weaker then must they have been in the human animal of primaeval times! Perhaps his descendants would even now kill one another without inhibition, if

1 [Cf. the fourth essay in *Totem and Taboo* (1912–13*a*), *RSE*, **13**, 96 ff.]

it were not that among those murderous acts there was one – the killing of the primitive father – which evoked an irresistible emotional reaction with momentous consequences. From it arose the commandment: Thou shalt not kill. Under totemism this commandment was restricted to the father substitute; but it was later extended to other people, though even today it is not universally obeyed.

But, as was shown by arguments which I need not repeat here, the primal father was the original image of God, the model on which later generations have shaped the figure of God. Hence the religious explanation is right. God actually played a part in the genesis of that prohibition; it was His influence, not any insight into social necessity, which created it. And the displacement of man's will on to God is fully justified. For men knew that they had disposed of their father by violence, and in their reaction to that impious deed, they determined to respect his will thenceforward. Thus religious doctrine tells us the historical truth – though subject, it is true, to some modification and disguise – whereas our rational account disavows it.

We now observe that the store of religious ideas includes not only wish fulfilments but important historical recollections. This concurrent influence of past and present must give religion a truly incomparable wealth of power. But perhaps with the help of an analogy yet another discovery may begin to dawn on us. Though it is not a good plan to transplant ideas far from the soil in which they grew up, yet here is a conformity which we cannot avoid pointing out. We know that a human child cannot successfully complete its development to the civilized stage without passing through a phase of neurosis sometimes of greater and sometimes of lesser distinctness. This is because so many drive demands
[43] which will later be unserviceable cannot be suppressed by the rational operation of the child's intellect but have to be tamed by acts of repression [*Verdrängungsakte*][T], behind which, as a rule, lies the motive of anxiety. Most of these infantile neuroses are overcome spontaneously in the course of growing up, and this is especially true of the obsessional neuroses of childhood. The remainder can be cleared up later still by psychoanalytic treatment. In just the same way, one might assume, humanity as a whole, in its development through the ages, fell into states analogous to the neuroses,[1] and for the same reasons – namely because in the times of its ignorance and intellectual weakness the drive

Verdrängung

1 [Freud returned to this question at the end of his *Civilization and its Discontents* (1930*a*), p. 129 f. below, in the last of the *New Introductory Lectures* (1933*a*), *RSE*, **22**, 148 ff., and in Essay III of *Moses and Monotheism* (1939*a*), ibid., **23**, 66 ff.]

renunciations indispensable for man's communal existence had been achieved by it only by means of purely affective forces. The precipitates of these processes resembling repression which took place in prehistoric times still remained attached to civilization for long periods. Religion would thus be the universal obsessional neurosis of humanity; like the obsessional neurosis of children, it arose out of the Oedipus complex, out of the relation to the father. If this view is right, it is to be supposed that a turning away from religion is bound to occur with the fatal inevitability of a process of growth, and that we find ourselves at this very juncture in the middle of that phase of development. Our behaviour should therefore be modelled on that of a sensible teacher who does not oppose an impending new development but seeks to ease its path and mitigate the violence of its irruption. Our analogy does not, to be sure, exhaust the essential nature of religion. If, on the one hand, religion brings with it obsessional restrictions [*Zwangseinschränkungen*][T], *Zwang* exactly as an individual obsessional neurosis does, on the other hand it comprises a system of wishful illusions together with a disavowal[1] [*Verleugnung*][T] of reality, such as we find in an isolated form nowhere else but in amentia,[2] in a state of blissful hallucinatory confusion. But these are only analogies, by the help of which we endeavour to understand a social phenomenon; the pathology of the individual does not supply us with a fully valid counterpart.

It has been repeatedly pointed out (by myself and in particular by [44] Theodor Reik[3]) in how great detail the analogy between religion and obsessional neurosis can be followed, and how many of the peculiarities and vicissitudes in the formation of religion can be understood in that light. And it tallies well with this that devout believers are safeguarded in a high degree against the risk of certain neurotic illnesses; their acceptance of the universal neurosis spares them the task of constructing a personal one.[4]

Our knowledge of the historical worth of certain religious doctrines increases our respect for them, but does not invalidate our proposal that they should cease to be put forward as the reasons for the precepts of civilization. On the contrary! Those historical residues have helped us to view religious teachings, as it were, as neurotic relics, and we may

1 [See the paper on 'Fetishism' (1927*e*), p. 138 below.]

2 ['Meynert's amentia': a state of acute hallucinatory confusion.]

3 [Cf. Freud, 'Obsessive Actions and Religious Practices' (1907*b*), *RSE*, **9**, 97 ff., and Reik (1927).]

4 [Freud had often made this point before, e.g. in a sentence added in 1919 to his study on Leonardo da Vinci (1910*c*), *RSE*, **11**, 112. Cf. also p. 78 below.]

now argue that the time has probably come, as it does in an analytic treatment, for replacing the effects of repression with the results of the rational operation of the intellect. We may foresee, but hardly regret, that such a process of remoulding will not stop at renouncing the solemn transfiguration of cultural precepts, but that a general revision of them will result in many of them being done away with. In this way our appointed task of reconciling men to civilization will to a great extent be achieved. We need not deplore the renunciation of historical truth when we put forward rational grounds for the precepts of civilization. The truths contained in religious doctrines are after all so distorted and systematically disguised that the mass of humanity cannot recognize them as truth. The case is similar to what happens when we tell a child that newborn babies are brought by the stork. Here, too, we are telling the truth in symbolic clothing, for we know what the large bird signifies. But the child does not know it. He hears only the distorted part of what we say, and feels that he has been deceived; and we know how often his distrust of the grown-ups and his refractoriness actually take their start from this impression. We have become convinced that it is better to avoid such symbolic disguisings of the truth in what we tell children and
[45] not to withhold [*versagen*] from them a knowledge of the true state of affairs commensurate with their intellectual level.[1]

1 [Freud later drew a distinction between what he termed 'material' and 'historical' truth in several passages. See, in particular, Section G of Part II of Essay III of *Moses and Monotheism* (1939*a*), *RSE*, **23**, 116 ff. and 118 *n*. Cf. also an Editors' footnote on the subject in Chapter XII (C) of *The Psychopathology of Everyday Life* (1901*b*), ibid., **6**, 220.]

IX

'You permit yourself contradictions which are hard to reconcile with [46]
one another. You begin by saying that a piece of writing like yours is quite harmless: no-one will let himself be robbed of his faith by considerations of the sort put forward in it. But since it is nevertheless your intention, as becomes evident later on, to upset that faith, we may ask why in fact you are publishing your work? In another passage, moreover, you admit that it may be dangerous, indeed very dangerous, for someone to discover that people no longer believe in God. Hitherto he has been docile, but now he throws off his obedience to the precepts of civilization. Yet your whole contention that basing the commandments of civilization on religious grounds constitutes a danger for civilization rests on the assumption that the believer can be turned into an unbeliever. Surely that is a complete contradiction.

'And here is another. On the one hand, you admit that men cannot be guided through their intelligence, they are ruled by their passions and their drive demands. But, on the other hand, you propose to replace the affective basis of their obedience to civilization with a rational one. Let who can understand this. To me it seems that it must be either one thing or the other.

'Besides, have you learnt nothing from history? Once before an attempt of this kind was made to substitute reason for religion, officially and in the grand manner. Surely you remember the French Revolution and Robespierre? And you must also remember how shortlived and miserably ineffectual the experiment was? The same experiment is being repeated in Russia at the present time, and we need not feel curious as to its outcome. Do you not think we may take it for granted that men cannot do without religion?

'You have said yourself that religion is more than an obsessional neurosis. But you have not dealt with this other side of it. You are content to work out the analogy with a neurosis. Men, you say, must be freed from a neurosis. What else may be lost in the process is of no concern to you.'

The appearance of contradiction has probably come about because I [47]
have dealt with complicated matters too hurriedly. But we can remedy this to some extent. I still maintain that what I have written is quite harmless in one respect. No believer will let himself be led astray from

his faith by these or any similar arguments. A believer is bound to the teachings of religion by certain ties of affection. But there are undoubtedly countless other people who are not in the same sense believers. They obey the precepts of civilization because they let themselves be intimidated by the threats of religion, and they are afraid of religion so long as they have to consider it as a part of the reality which hems them in. They are the people who break away as soon as they are allowed to give up their belief in the reality value of religion. But they too are unaffected by arguments. They cease to fear religion when they observe that others do not fear it; and it was of them that I asserted that they would get to know about the decline of religious influence even if I did not publish my work. [Cf. pp. 36–7 above.]

But I think you yourself attach more weight to the other contradiction which you charge me with. Since men are so little accessible to reasonable arguments and are so entirely governed by their drive wishes, why should one set out to deprive them of a drive satisfaction and replace it with reasonable arguments? It is true that men are like this; but have you asked yourself whether they *must* be like this, whether their innermost nature necessitates it? Can an anthropologist give the cranial index of a people whose custom it is to deform their children's heads by bandaging them round from their earliest years? Think of the depressing contrast between the radiant intelligence of a healthy child and the feeble intellectual powers of the average adult. Can we be quite certain that it is not precisely religious education which bears a large share of the blame for this relative atrophy? I think it would be a very long time before a child who was not influenced began to trouble himself about God and things in another world. Perhaps his thoughts on these matters would then take the same paths as they did with his forefathers. But we do not wait for such a development; we introduce him to the doctrines of religion at an age when he is neither interested in them nor capable of grasping their import. Is it not true that the two main points in the programme for the education of children today are retardation of sexual
[48] development and premature religious influence? Thus by the time the child's intellect awakens, the doctrines of religion have already become unassailable. But are you of the opinion that it is very conducive to the strengthening of the intellectual function that so important a field should be closed against it by the threat of Hell-fire? When a man has once brought himself to accept uncritically all the absurdities that religious doctrines put before him and even to overlook the contradictions between them, we need not be greatly surprised at the weakness of his

intellect. But we have no other means of controlling our driven nature [*Triebhaftigkeit*] but our intelligence. How can we expect people who are under the dominance of prohibitions of thought to attain the psychological ideal, the primacy of the intelligence? You know, too, that women in general are said to suffer from 'physiological feeblemindedness'[1] – that is, from a lesser intelligence than men. The fact itself is disputable and its interpretation doubtful, but one argument in favour of this intellectual atrophy being of a secondary nature is that women labour under the harshness of an early prohibition against turning their thoughts to what would most have interested them – namely, the problems of sexual life. So long as a person's early years are influenced not only by a sexual inhibition of thought but also by a religious inhibition and by a loyal inhibition[2] derived from this, we cannot really tell what in fact he is like.

But I will moderate my zeal and admit the possibility that I, too, am chasing an illusion. Perhaps the effect of the religious prohibition of thought may not be so bad as I suppose; perhaps it will turn out that human nature remains the same even if education is not abused in order to subject people to religion. I do not know and you cannot know either. It is not only the great problems of this life that seem insoluble at the present time; many lesser questions too are difficult to answer. But you must admit that here we are justified in having a hope for the future – that perhaps there is a treasure to be dug up capable of enriching civilization and that it is worth making the experiment of an irreligious [*irreligiösen*][t] education. Should the experiment prove unsatisfactory I am ready to give up the reform and to return to my earlier, purely descriptive judgement that man is a creature of weak intelligence who is ruled by his drive wishes. [49]

On another point I agree with you unreservedly. It is certainly senseless to begin by trying to do away with religion by force and at a single blow. Above all, because it would be hopeless. The believer will not let his belief be torn from him, either by arguments or by prohibitions. And even if this did succeed with some it would be cruelty. A man who has been taking sleeping draughts for tens of years is naturally unable to sleep if his sleeping draught is taken away from him. That the effect of religious consolations may be likened to that of a narcotic is well illustrated by what is happening in America. There

1 [The phrase was used by Moebius (1903). Cf. Freud's early paper on 'civilized' sexual morality (1908*d*), *RSE*, **9**, 173, where the present argument is anticipated.]

2 [I.e. in regard to the monarchy.]

they are now trying – obviously under the influence of petticoat government – to deprive people of all stimulants, intoxicants and other pleasure-producing substances, and instead, by way of compensation, are surfeiting them with piety. This is another experiment as to whose outcome we need not feel curious [p. 43 above].[1]

Thus I must contradict you when you go on to argue that men are completely unable to do without the consolation of the religious illusion, that without it they could not bear the troubles of life and the cruelties of reality. That is true, certainly, of the men into whom you have instilled the sweet – or bitter-sweet – poison from childhood onwards. But what of the other men, who have been sensibly brought up? Perhaps those who do not suffer from the neurosis will need no intoxicant to deaden it. They will, it is true, find themselves in a difficult situation. They will have to admit to themselves the full extent of their helplessness and their insignificance in the machinery of the universe; they can no longer be the centre of creation, no longer the object of tender care on the part of a beneficent Providence. They will be in the same position as a child who has left the parental house where he was so warm and comfortable. But surely infantilism is destined to be surmounted. Men cannot remain children for ever; they must in the end go out into 'hostile life'. We may call this '*education to reality*'. Need I confess to you that the sole purpose of my book is to point out the necessity for this forward step?

[50] You are afraid, probably, that they will not stand up to the hard test? Well, let us at least hope they will. It is something, at any rate, to know that one is thrown upon one's own resources. One learns then to make a proper use of them. And men are not entirely without assistance. Their scientific knowledge has taught them much since the days of the Deluge, and it will increase their power still further. And, as for the great necessities of Fate, against which there is no help, they will learn to endure them with resignation. Of what use to them is the mirage of wide acres in the moon, whose harvest no-one has ever yet seen? As honest smallholders on this earth they will know how to cultivate their plot in such a way that it supports them. By withdrawing their expectations from the other world and concentrating all their liberated energies into their life on earth, they will probably succeed in achieving a state of things in which life will become tolerable for everyone and civilization no longer

1 [This was written in the middle of the period of national prohibition in the United States (1920–33).]

oppressive to anyone. Then, with one of our fellow unbelievers, they will be able to say without regret:

> Den Himmel überlassen wir
> Den Engeln und den Spatzen.[1]

1 ['We leave Heaven to the angels and the sparrows.' From Heine's poem *Deutschland* (Caput I). The word which is here translated 'fellow unbelievers' – in German '*Unglaubensgenossen*' – was applied by Heine himself to Spinoza. It had been quoted by Freud as an example of a particular kind of joke technique in his book on *Jokes* (1905*c*), *RSE*, **8**, 68.]

X

[51] 'That sounds splendid! A race of men who have renounced all illusions and have thus become capable of making their existence on earth tolerable! I, however, cannot share your expectations. And that is not because I am the obstinate reactionary you perhaps take me for. No, it is because I am sensible. We seem now to have exchanged roles: you emerge as an enthusiast who allows himself to be carried away by illusions, and I stand for the claims of reason, the rights of scepticism. What you have been expounding seems to me to be built upon errors which, following your example, I may call illusions, because they betray clearly enough the influence of your wishes. You pin your hope on the possibility that generations which have not experienced the influence of religious doctrines in early childhood will easily attain the desired primacy of the intelligence over the life of the drives. This is surely an illusion: in this decisive respect human nature is hardly likely to change. If I am not mistaken – one knows so little about other civilizations – there are even today peoples which do not grow up under the pressure of a religious system, and yet they approach no nearer to your ideal than the rest. If you want to expel religion from our European civilization, you can only do it by means of another system of doctrines; and such a system would from the outset take over all the psychological characteristics of religion – the same sanctity, rigidity and intolerance, the same prohibition of thought – for its own defence. You have to have something of the kind in order to meet the requirements of education. And you cannot do without education. The path from the infant at the breast to the civilized man is a long one; too many human young would go astray on it and fail to reach their life tasks at the proper time if they were left without guidance to their own development. The doctrines which had been applied in their upbringing would always set limits to the thinking of their riper years – which is exactly what you reproach religion with doing today. Do you not observe that it is an ineradicable and innate defect of our and every other civilization that it imposes on children, who are driven [*triebhaften*] and weak in intellect, the making
[52] of decisions which only the mature intelligence of adults can vindicate? But civilization cannot do otherwise, because of the fact that mankind's age-long development is compressed into a few years of childhood; and it is only by emotional forces that the child can be induced to master

the task set before it. Such, then, are the prospects for your "primacy of the intellect".

'And now you must not be surprised if I plead on behalf of retaining the religious doctrinal system as the basis of education and of man's communal life. This is a practical problem, not a question of reality value. Since, for the sake of preserving our civilization, we cannot postpone influencing the individual until he has become ripe for civilization (and many would never become so in any case), since we are obliged to impose on the growing child some doctrinal system which shall operate in him as an axiom that admits of no criticism, it seems to me that the religious system is by far the most suitable for the purpose. And it is so, of course, precisely on account of its wish-fulfilling and consolatory power, by which you claim to recognize it as an "illusion". In view of the difficulty of discovering anything about reality – indeed, of the doubt whether it is possible for us to do so at all – we must not overlook the fact that human needs, too, are a piece of reality, and, in fact, an important piece and one that concerns us especially closely.

'Another advantage of religious doctrine resides, to my mind, in one of its characteristics to which you seem to take particular exception. For it allows of a refinement and sublimation of ideas, which make it possible for it to be divested of most of the traces which it bears of primitive and infantile thinking. What then remains is a body of ideas which science no longer contradicts and is unable to disprove. These modifications of religious doctrine, which you have condemned as half-measures and compromises, make it possible to avoid the cleft between the uneducated masses and the philosophic thinker, and to preserve the common bond between them which is so important for the safeguarding of civilization. With this, there would be no need to fear that the men of the people would discover that the upper strata of society "no longer believe in God". I think I have now shown that your endeavours come down to an attempt to replace a proved and emotionally valuable illusion with another one, which is unproved and without emotional value.'

[53] You will not find me inaccessible to your criticism. I know how difficult it is to avoid illusions; perhaps the hopes I have confessed to are of an illusory nature, too. But I hold fast to one distinction. Apart from the fact that no penalty is imposed for not sharing them, my illusions are not, like religious ones, incapable of correction. They have not the character of a delusion. If experience should show – not to me, but to others after me, who think as I do – that we have been mistaken, we will give up our expectations. Take my attempt for what it is. A psychologist

who does not deceive himself about the difficulty of finding one's bearings in this world, makes an endeavour to assess the development of man, in the light of the small portion of knowledge he has gained through a study of the mental processes of individuals during their development from child to adult. In so doing, the idea forces itself upon him that religion is comparable to a childhood neurosis, and he is optimistic enough to suppose that mankind will surmount this neurotic phase, just as so many children grow out of their similar neurosis. These discoveries derived from the psychology of the individual may be insufficient, their application to the human race unjustified, and his optimism unfounded. I grant you all these uncertainties. But often one cannot refrain from saying what one thinks, and one excuses oneself on the ground that one is not giving it out for more than it is worth.

And there are two points that I must dwell on a little longer. Firstly, the weakness of my position does not imply any strengthening of yours. I think you are defending a lost cause. We may insist as often as we like that man's intellect is powerless in comparison with the life of his drives, and we may be right in this. Nevertheless, there is something peculiar about this weakness. The voice of the intellect is a soft one, but it does not rest till it has gained a hearing. Finally, after a countless succession of rebuffs, it succeeds. This is one of the few points on which one may be optimistic about the future of mankind, but it is in itself a point of no small importance. And from it one can derive yet other hopes. The primacy of the intellect lies, it is true, in a distant, distant future, but probably not in an *infinitely* distant one. It will presumably set itself the same aims as those whose realization you expect from your God (of course within human limits – so far as external reality, *'Ανάγκη*, allows it), namely the love of man and the decrease of suffering. This being so, we may tell ourselves that our antagonism is only a temporary [54] one and not irreconcilable. We desire the same things, but you are more impatient, more exacting, and – why should I not say it? – more self-seeking than I and those on my side. You would have the state of bliss begin directly after death; you expect the impossible from it and you will not surrender the claims of the individual. Our God, *Λόγος*,[1] will fulfil whichever of these wishes nature outside us allows, but he will do it very gradually, only in the unforeseeable future, and for a new generation of men. He promises no compensation for us, who suffer

1 The twin gods *Λόγος* [*Logos*: Reason] and *'Ανάγκη* [*Ananke*: Necessity] of the Dutch writer Multatuli. [Cf. an Editors' footnote to 'The Economic Problem of Masochism' (1924*c*), *RSE*, **19**, 159 *n.* 5.]

grievously from life. On the way to this distant goal your religious doctrines will have to be discarded, no matter whether the first attempts fail, or whether the first substitutes prove to be untenable. You know why: in the long run nothing can withstand reason and experience, and the contradiction which religion offers to both is all too palpable. Even purified religious ideas cannot escape this fate, so long as they try to preserve anything of the consolation of religion. No doubt if they confine themselves to a belief in a higher spiritual being, whose qualities are indefinable and whose purposes cannot be discerned, they will be proof against the challenge of science; but then they will also lose their hold on human interest.

And secondly: observe the difference between your attitude to illusions and mine. You have to defend the religious illusion with all your might. If it becomes discredited – and indeed the threat to it is great enough – then your world collapses. There is nothing left for you but to despair of everything, of civilization and the future of mankind. From that bondage I am, we are, free. Since we are prepared to renounce a good part of our infantile wishes, we can bear it if a few of our expectations turn out to be illusions.

Education freed from the burden of religious doctrines will not, it may be, effect much change in men's psychological nature. Our god *Λόγος* is perhaps not a very almighty one, and he may be able to fulfil only a small part of what his predecessors have promised. If we have to acknowledge this we shall accept it with resignation. We shall not on that account lose our interest in the world and in life, for we have one sure support which you lack. We believe that it is possible for scientific [55] work to gain some knowledge about the reality of the world, by means of which we can increase our power and in accordance with which we can arrange our life. If this belief is an illusion, then we are in the same position as you. But science has given us evidence by its numerous and important successes that it is no illusion. Science has many open enemies, and many more secret ones, among those who cannot forgive her for having weakened religious faith and for threatening to overthrow it. She is reproached for the smallness of the amount she has taught us and for the incomparably greater field she has left in obscurity. But, in this, people forget how young she is, how difficult her beginnings were and how infinitesimally small is the period of time since the human intellect has been strong enough for the tasks she sets. Are we not all at fault, in basing our judgements on periods of time that are too short? We should make the geologists our model. People complain of the unreliability of

science – how she announces as a law today what the next generation recognizes as an error and replaces with a new law whose accepted validity lasts no longer. But this is unjust and in part untrue. The transformations of scientific opinion are developments, advances, not revolutions. A law which was held at first to be universally valid proves to be a special case of a more comprehensive uniformity, or is limited by another law, not discovered till later; a rough approximation to the truth is replaced by a more carefully adapted one, which in turn awaits further perfectioning. There are various fields where we have not yet surmounted a phase of research in which we make trial with hypotheses that soon have to be rejected as inadequate; but in other fields we already possess an assured and almost unalterable core of knowledge. Finally, an attempt has been made to discredit scientific endeavour in a radical way, on the ground that, being bound to the conditions of our own organization, it can yield nothing else than subjective results, while the real nature of things outside ourselves remains inaccessible. But this is to disregard several factors which are of decisive importance for the understanding of scientific work. In the first place, our organization – that is, our mental apparatus – has been developed precisely in the attempt to explore the external world, and it must therefore have real-
[56] ized in its structure some degree of expediency; in the second place, it is itself a constituent part of the world which we set out to investigate, and it readily admits of such an investigation; thirdly, the task of science is fully covered if we limit it to showing how the world must appear to us in consequence of the particular character of our organization; fourthly, the ultimate findings of science, precisely because of the way in which they are acquired, are determined not only by our organization but by the things which have affected that organization; finally, the problem of the nature of the world without regard to our percipient mental apparatus is an empty abstraction, devoid of practical interest.

No, our science is no illusion. But an illusion it would be to suppose that what science cannot give us we can get elsewhere.

Civilization and its Discontents

ENGLISH TRANSLATIONS

Civilization and its Discontents
1930 London: Hogarth Press and Institute of Psycho-Analysis. New York: Cape and Smith. Pp. 144. (Tr. Joan Riviere.)
1961 *SE*, **21**, 64–145. (Tr. J. Strachey, based on the one published in 1930.)
1985 *PFL*, **12**, 243–340. (Reprint of the *SE* translation.)
2002 *PMC*, *Civilization and its Discontents*, 1–82. (Tr. David McLintock.)

The present translation is a corrected and revised reprint of the *SE* version.

The first chapter of the German original was published slightly in advance of the rest of the book in *Psychoanal. Bewegung*, **1** (4), November–December, 1929. The fifth chapter appeared separately in the next issue of the same periodical, **2** (1), January–February, 1930. Two or three extra footnotes were included in the edition of 1931 and a new final sentence was added to the work. None of these additions appeared in the earlier version of the English translation.

Freud had finished *The Future of an Illusion* in the autumn of 1927. During the following two years, chiefly, no doubt, on account of his illness, he produced very little. But in the summer of 1929 he began writing another book, once more on a sociological subject. The first draft was finished by the end of July; the book was sent to the printers early in November and was actually published before the end of the year, though it carried the date '1930' on its title page (Jones, 1957, 157–8).

The original title chosen for it by Freud was '*Das Unglück in der Kultur*' ('Unhappiness in Civilization'); but '*Unglück*' was later altered to '*Unbehagen*' – a word for which it was difficult to choose an English equivalent, though the French '*malaise*' [60] might have served. Freud suggested '*Man's Discomfort in Civilization*' in a letter to

his translator, Mrs Riviere; but it was she herself who found the solution to the difficulty in the title that was finally adopted. The controversy surrounding this decision is discussed more fully in *RSE*, **24**, 129–31. Considerable controversy has also surrounded the translation of '*Kultur*' as 'civilization'. This question is discussed more fully in ibid., **24**, 74.

The main theme of the book – the irremediable antagonism between the demands of drive and the restrictions of civilization – may be traced back to some of Freud's very earliest psychological writings. Thus, on May 31, 1897, he wrote to Fliess that 'incest is antisocial – civilization consists in this progressive renunciation' (Freud, 1950*a*, Draft N); and a year later, in a paper on 'Sexuality in the Aetiology of the Neuroses' (1898*a*), he wrote that 'we may with justice regard civilization, too, as responsible for the spread of neurasthenia' (*RSE*, **3**, 272). Nevertheless, in his early writings Freud does not seem to have regarded repression as being wholly due to external social influences. Though in his *Three Essays* (1905*d*) he spoke of 'the inverse relation holding between civilization and the free development of sexuality' (ibid., **7**, 214), elsewhere in the same work he had the following comment to make on the dams against the sexual drive that emerge during the latency period: 'One gets an impression from civilized children that the construction of these dams is a product of education, and no doubt education has much to do with it. But in reality this development is organically determined and fixed by heredity, and it can occasionally occur without any help at all from education.' (Ibid., 158.)

The notion of there being an 'organic repression' paving the way to civilization – a notion that is expanded in the two long footnotes at the beginning and end of Chapter IV (pp. 90 f. and 95 f. below) – goes back to the same early period. In a letter to Fliess of November 14, 1897, Freud wrote that he had often suspected 'that something organic played a part in repression' (Freud, 1950*a*, Letter 75). He went on, in precisely the sense of these footnotes, to suggest the importance as factors in repression of the adoption of an upright carriage and the replacement of smell by sight as the dominant sense. A still earlier hint at the same idea occurs in a letter of January 11, 1897 (ibid., Letter 55). In Freud's published writings the only mentions of
[61] these ideas before the present one seem to be a short passage in the 'Rat Man' analysis (1909*d*), *RSE*, **10**, 187–8, and a still shorter one in the second paper on the psychology of love (1912*d*), ibid., **11**, 176. In particular, no analysis of the deeper, internal origins of civilization is to be found in what is by far the longest of Freud's earlier discussions of the subject,[1] his paper on '"Civilized" Sexual Morality and Modern Nervous Illness' (1908*d*), ibid., **9**, which gives the impression of the restrictions of civilization as something imposed from without.

But indeed no clear evaluation of the part played in these restrictions by internal and external influences and of their reciprocal effects was possible till Freud's investigations of ego psychology had led him to his hypotheses of the superego and its origin from the individual's earliest object relations. It is because of this that such

1 The subject is touched on in many other works, among which may be mentioned a paper on 'The Resistances to Psychoanalysis' (1925*e*), *RSE*, **19**, 216 ff., the first pages of *The Future of an Illusion* (1927*c*), p. 5 ff. above, and the last paragraphs of *Why War?* (1933*b*), *RSE*, **22**, 224. Cf. also the related idea of an 'advance in intellectuality' in *Moses and Monotheism* (1939*a*), Essay III, Part II (C), ibid., **23**, 101–5.

a large part of the present work (especially in Chapters VII and VIII) is concerned with the further exploration and clarification of the nature of the sense of guilt, and that Freud (on p. 121 below) declares his 'intention to represent the sense of guilt as the most important problem in the development of civilization'. And this, in turn, is the ground for the second major side-issue of this work (though neither of them is in fact a side-issue) – the destructive drive.

The history of Freud's views on the aggressive or destructive drive is a complicated one and can only be summarily indicated here. Throughout his earlier writings the context in which he viewed it predominantly was that of sadism. His first lengthy discussions of this were in the *Three Essays on the Theory of Sexuality* (1905*d*), where it appeared as one of the 'component drives' of the sexual drive. 'Thus', he wrote in Section 2 (B) of the first essay, 'sadism would correspond to an aggressive component of the sexual drive which has become independent and exaggerated and, by displacement, has usurped the leading position' (*RSE*, **7**, 140–1). Nevertheless, later on, in Section 4 of the second essay, the original independence of the aggressive impulses was recognized: 'It may be assumed that the impulses of cruelty arise from sources which are in fact independent of sexuality, but may become united with it at an early stage' (ibid., 171 *n*. 1). The independent sources indicated were to be [62]
traced to the self-preservative drives. This passage was altered in the edition of 1915, where it was stated that 'the impulse of cruelty arises from the drive to mastery' and the phrase about its being 'independent of sexuality' was omitted. But already, in 1909, in the course of combating Adler's theories, Freud had made a much more sweeping pronouncement. In Section II of the third chapter of the 'Little Hans' case history (1909*b*), Freud wrote: 'I cannot bring myself to assume the existence of a special aggressive drive alongside of the familiar drives to self-preservation and to sex, and on an equal footing with them' (ibid., **10**, 107).[1] The reluctance to accept an aggressive drive independent of the libido was assisted by the hypothesis of narcissism. Impulses of aggressiveness, and of hatred too, had from the first seemed to belong to the self-preservative drive, and, since this was now subsumed under the libido, no independent aggressive drive was called for. And this was so in spite of the bipolarity of object relations, of the frequent admixtures of love and hate, and of the complex origin of hate itself. (See 'Drives and their Vicissitudes' (1915*c*), ibid., **14**, 121–2.) It was not until Freud's hypothesis of a 'death drive' that a truly independent aggressive drive came into view in *Beyond the Pleasure Principle* (1920*g*). (See, in particular, Chapter VI, ibid., **18**, 51–3.) But it is to be remarked that even there, and in Freud's later writings (for instance, in Chapter IV of *The Ego and the Id*, 1923*b*; ibid., **19**), the aggressive drive was still something secondary, derived from the primary self-destructive death drive. This is still true of the present work, even though here the stress is much more upon the death drive's manifestations *outwards*; and it is also true of the further discussions of the problem in the later part of Lecture XXXII of the *New Introductory Lectures* (1933*a*), ibid., **22**, and at more than one point in the posthumously published *Outline*

1 A footnote added in 1923 brought the inevitable qualification of this judgement. Since the time at which it was made 'I have myself', writes Freud, 'been obliged to assert the existence of an "aggressive drive", but it is different from Adler's. I prefer to call it the "destructive" or "death drive".' Adler's had, in fact, been more in the nature of a drive to self-assertion.

of Psychoanalysis (1940*a* [1938]), ibid., **23**. It is nevertheless tempting to quote a
[63] couple of sentences from a letter written by Freud on May 27, 1937, to Princess Marie Bonaparte,[1] in which he appears to be hinting at a greater original independence of external destructiveness: 'The turning inwards of the aggressive drive is of course the counterpart to the turning outwards of the libido when it passes over from the ego to objects. We should have a neat schematic picture if we supposed that originally, at the beginning of life, all libido was directed to the inside and all aggressiveness to the outside, and that in the course of life this gradually altered. But perhaps this may not be correct.' It is only fair to add that in his next letter Freud wrote: 'I beg you not to set too much value on my remarks about the destructive drive. They were only made at random and would have to be carefully thought over before being published. Moreover, there is little that is new in them.'

It will thus be obvious that *Civilization and its Discontents* is a work whose interest ranges far beyond sociology.

1 She very kindly allowed it to be reproduced here. The whole passage can also be found (in a different translation) in Appendix A (No. 33) of Ernest Jones's biography (Jones, 1957, 494). The topic had been considered by Freud in Section VI of the paper, written shortly before this letter, on 'Analysis Terminable and Interminable' (1937*c*), *RSE*, **23**, 216 ff.

CIVILIZATION AND ITS DISCONTENTS[t]

I[1]

It is impossible to escape the impression that people commonly use [64]
false standards of measurement – that they seek power [*Macht*][T], success and wealth for themselves and admire them in others, and that they underestimate what is of true value in life. And yet, in making any general judgement of this sort, we are in danger of forgetting how variegated the human world and its mental [*seelischen*][T] life are. There are a *Seele*
few men from whom their contemporaries do not withhold admiration, although their greatness rests on attributes and achievements which are completely foreign to the aims and ideals of the multitude. One might easily be inclined to suppose that it is after all only a minority which appreciates these great men, while the large majority cares nothing for them. But things are probably not as simple as that, thanks to the discrepancies between people's thoughts and their actions, and to the diversity of their wishful impulses [*Wunschregungen*][T]. *Regung*

One of these exceptional few calls himself my friend in his letters to me. I had sent him my small book that treats religion as an illusion,[2] and he answered that he entirely agreed with my judgement upon religion, but that he was sorry I had not properly appreciated the true source of religious sentiments. This, he says, consists in a peculiar feeling, which he himself is never without, which he finds confirmed by many others, and which he may suppose is present in millions of people. It is a feeling which he would like to call a sensation of 'eternity', a feeling as of something limitless, unbounded – as it were, 'oceanic'. This feeling, he adds, is a purely subjective fact, not an article of faith; it brings with it no

1 [Grubrich-Simitis (1993, 214 *n.* 1; trans., 168 *n.* 33, slightly modified here) tells us of a handwritten list in the Library of Congress, entitled 'Headings', in which Freud sketched titles and subtitles for the opening chapters of this work, although he did not use them in the printed version: 'The Striving for Happiness', 'The Sources of Suffering', 'Loss of Happiness from the Mastery of Drive', 'Happiness in Love' and 'Civilization as a Source of Suffering'.]

2 [*The Future of an Illusion* (1927*c*); see p. 5 above.]

assurance of personal immortality, but it is the source of the religious energy which is seized upon by the various Churches and religious systems, directed by them into particular channels, and doubtless also exhausted by them. One may, he thinks, rightly call oneself religious on the ground of this oceanic feeling alone, even if one rejects every belief and every illusion.

[65] The views expressed by the friend whom I so much honour, and who himself once praised the magic of illusion in a poem,[1] caused me no small difficulty. I cannot discover this 'oceanic' feeling in myself. It is not easy to deal scientifically with feelings. One can attempt to describe their physiological signs. Where this is not possible – and I am afraid that the oceanic feeling too will defy this kind of characterization – nothing remains but to fall back on the ideational content *Vorstellung* [*Vorstellungsinhalt*][T] which is most readily associated with the feeling. If I have understood my friend rightly, he means the same thing by it as the consolation offered by an original and somewhat eccentric dramatist to his hero who is facing a self-inflicted death. 'We cannot fall out of this world.'[2] That is to say, it is a feeling of an indissoluble bond, of being one with the external world as a whole. I may remark that to me this seems something rather in the nature of an intellectual perception, which is not, it is true, without an accompanying feeling-tone, but only such as would be present with any other act of thought of equal range. From my own experience I could not convince myself of the primary nature of such a feeling. But this gives me no right to deny that it does in fact occur in other people. The only question is whether it is being *Deutung* correctly interpreted [*gedeutet*][T] and whether it ought to be regarded as the *fons et origo* of the whole need for religion.

I have nothing to suggest which could have a decisive influence on the solution to this problem. The idea of men's receiving an intimation of their connection with the world around them through an immediate feeling which is from the outset directed to that purpose sounds so strange and fits in so badly with the fabric of our psychology that one is justified in attempting to discover a psychoanalytic – that is, a genetic [*genetische*][T] – explanation of such a feeling. The following line of

1 [*Footnote added* 1931:] *Liluli* [1919]. – Since the publication of his two books *La vie de Ramakrishna* [1929] and *La vie de Vivekananda* [1930], I need no longer hide the fact that the friend spoken of in the text is Romain Rolland. [Romain Rolland had written to Freud about the 'oceanic feeling' in a letter of December 5, 1927, very soon after the publication of *The Future of an Illusion*.]

2 Christian Dietrich Grabbe [1801–36], *Hannibal*: 'Ja, aus der Welt werden wir nicht fallen. Wir sind einmal darin.' ['Indeed, we shall not fall out of this world. We are in it once and for all.']

thought suggests itself. Normally, there is nothing of which we are more certain than the feeling of our self [*Selbst*], of our own ego [*Ichs*].[1] This ego appears to us as something autonomous and unitary, marked [66]
off distinctly from everything else. That such an appearance is deceptive, and that on the contrary the ego is continued inwards, without any sharp delimitation, into an unconscious mental entity which we designate as the id [*Es*][T] and for which it serves as a kind of façade – this was a discovery first made by psychoanalytic research, which should still have much more to tell us about the relation of the ego to the id. But towards the outside, at any rate, the ego seems to maintain clear and sharp lines of demarcation. There is only one state – admittedly an unusual state, but not one that can be stigmatized as pathological – in which it does not do this. At the height of being in love the boundary between ego and object threatens to melt away. Against all the evidence of his senses, a man who is in love declares that 'I' and 'you' [*Ich und Du*] are one, and is prepared to behave as if it were a fact.[2] What can be temporarily done away with by a physiological [i.e. normal] function must also, of course, be liable to be disturbed by pathological processes. Pathology has made us acquainted with a great number of states in which the boundary lines between the ego and the external world become uncertain or in which they are actually drawn incorrectly. There are cases in which parts of a person's own body, even portions of his own mental life – his perceptions, thoughts and feelings – appear alien to him and as not belonging to his ego; there are other cases in which he ascribes to the external world things that clearly originate in his own ego and that ought to be acknowledged by it. Thus even the feeling of our own ego is subject to disturbances and the boundaries of the ego are not constant.

Further reflection tells us that the adult's ego feeling cannot have been the same from the beginning. It must have gone through a process of development, which cannot, of course, be demonstrated but which admits of being constructed with a fair degree of probability.[3] An infant at the breast does not as yet distinguish his ego from the external world [67]
as the source of the sensations flowing in upon him. He gradually learns

1 [Some remarks on Freud's use of the terms 'ego' and 'self' can be found in the Editors' Introduction to *The Ego and the Id* (1923*b*), *RSE*, **19**, 7. Regarding the translation of '*Ich*', see ibid., **24**, 68–71.]

2 [Cf. a footnote to Section III of the Schreber case history (1911*c*), ibid., **12**, 60 *n.* 1.]

3 Cf. the many writings on the topic of ego development and ego feeling, dating from Ferenczi's paper on 'Stages in the Development of the Sense of Reality' (1913*c*) to Federn's contributions of 1926, 1927 and later.

to do so, in response to various promptings.[1] He must be very strongly impressed by the fact that some sources of excitation [*Erregungsquellen*][T], which he will later recognize as his own bodily organs, can provide him with sensations at any moment, whereas other sources evade him from time to time – among them what he desires most of all, his mother's breast – and only reappear as a result of his screaming for help. In this way there is for the first time set over against the ego an 'object', in the form of something which exists 'outside' and which is only forced to appear by a special action.[2] A further incentive to a disengagement of the ego from the general mass of sensations – that is, to the recognition of an 'outside', an external world – is provided by the frequent, manifold and unavoidable sensations of pain and unpleasure [*Schmerz- und Unlustempfindungen*] the removal and avoidance of which is enjoined by the pleasure principle [*Lustprinzip*][T], in the exercise of its unrestricted domination. A tendency arises to separate from the ego everything that can become a source of such unpleasure, to throw it outside and to create a pure pleasure ego which is confronted with a strange and threatening 'outside'. The boundaries of this primitive pleasure ego cannot escape rectification through experience. Some of the things that one is unwilling to give up, because they give pleasure, are nevertheless not ego but object; and some sufferings that one seeks to expel turn out to be inseparable from the ego by virtue of their internal origin. One comes to learn a procedure by which, through a deliberate direction of one's sensory activities and through suitable muscular action, one can differentiate between what is internal – what belongs to the ego – and what is external – what emanates from the outer world. In this way one makes the first step towards the introduction of the reality principle which is to dominate future development.[3]

Erregung

Lust

[68] This differentiation, of course, serves the practical purpose of enabling one to defend [*erwehren*] oneself against sensations of unpleasure which one actually feels or with which one is threatened. In order to fend off [*Abwehr*][T] certain unpleasurable excitations arising from within, the ego can use no other methods than those which it uses against

1 [In this paragraph Freud was going over familiar ground. He had discussed the matter not long before, in his paper on 'Negation' (1925*h*), *RSE*, **19**, 238–40. But he had dealt with it on several earlier occasions. See, for instance, 'Drives and their Vicissitudes' (1915*c*), ibid., **14**, 104–5 and 117–20, and *The Interpretation of Dreams* (1900*a*), ibid., **5**, 505–6. Its essence, indeed, is already to be found in the 'Project' of 1895, Sections 1, 2, 11 and 16 of Part I (Freud, 1950*a*).]

2 [The 'specific action' of the 'Project'.]

3 [Cf. 'Formulations on the Two Principles of Mental Functioning' (1911*b*), ibid., **12**, 218–19.]

unpleasure coming from without, and this is the starting point of important pathological disturbances.

In this way, then, the ego detaches itself from the external world. Or, to put it more correctly, originally the ego includes everything, later it separates off an external world from itself. Our present ego feeling is, therefore, only a shrunken residue of a much more inclusive – indeed, an all-embracing – feeling which corresponded to a more intimate bond between the ego and the world about it. If we may assume that there are many people in whose mental life this primary ego feeling has persisted to a greater or lesser degree, it would exist in them side by side with the narrower and more sharply demarcated ego feeling of maturity, like a kind of counterpart to it. In that case, the ideational contents appropriate to it would be precisely those of limitlessness and of a bond with the universe – the same ideas with which my friend elucidated the 'oceanic' feeling.

But have we a right to assume the survival of something that was originally there, alongside of what was later derived from it? Undoubtedly. There is nothing strange in such a phenomenon, whether in the mental field or elsewhere. In the animal kingdom we hold to the view that the most highly developed species have proceeded from the lowest; and yet we find all the simple forms still in existence today. The race of the great saurians is extinct and has made way for the mammals; but a true representative of it, the crocodile, still lives among us. This analogy may be too remote, and it is also weakened by the circumstance that the lower species which survive are for the most part not the true ancestors of the present-day more highly developed species. As a rule the intermediate links have died out and are known to us only through reconstruction. In the realm of the mind, on the other hand, what is primitive is so commonly preserved alongside of the transformed version which has arisen from it that it is unnecessary to give instances as evidence. When this happens it is usually in consequence of a divergence in development: one portion (in the quantitative sense) of an attitude or drive impulse [*Triebregung*][T] has remained unaltered, while another portion has undergone further development. [69] *Trieb*

This brings us to the more general problem of preservation in the sphere of the mind. The subject has hardly been studied as yet;[1] but it is so attractive and important that we may be allowed to turn our attention to it for a little, even though our excuse is insufficient. Since we

1 [A footnote on the subject was added by Freud in 1907 to Section F of the last chapter of *The Psychopathology of Everyday Life* (1901*b*), *RSE*, **6**, 235–6.]

overcame the error of supposing that the forgetting we are familiar with signified a destruction of the memory trace – that is, its annihilation – we have been inclined to take the opposite view, that in mental life nothing which has once been formed can perish – that everything is somehow preserved and that in suitable circumstances (when, for instance, regression goes back far enough) it can once more be brought to light. Let us try to grasp what this assumption involves by taking an analogy from another field. We will choose as an example the history of the Eternal City.[1] Historians tell us that the oldest Rome was the *Roma Quadrata*, a fenced settlement on the Palatine. Then followed the phase of the *Septimontium*, a federation of the settlements on the different hills; after that came the city bounded by the Servian wall; and later still, after all the transformations during the periods of the republic and the early Caesars, the city which the Emperor Aurelian surrounded with his walls. We will not follow the changes which the city went through any further, but we will ask ourselves how much a visitor, whom we will suppose to be equipped with the most complete historical and topographical knowledge, may still find left of these early stages in the Rome of today. Except for a few gaps, he will see the wall of Aurelian almost unchanged. In some places he will be able to find sections of the Servian wall where they have been excavated and brought to light. If he knows enough – more than present-day archaeology does – he may perhaps be able to trace out in the plan of the city the whole course of that wall and the outline of the *Roma Quadrata*. Of the buildings which once occupied this ancient area he will find nothing, or only scanty remains, for
[70] they exist no longer. The best information about Rome in the republican era would only enable him at the most to point out the sites where the temples and public buildings of that period stood. Their place is now taken by ruins, but not by ruins of themselves but of later restorations made after fires or destruction. It is hardly necessary to remark that all these remains of ancient Rome are found dovetailed into the jumble of a great metropolis which has grown up in the last few centuries since the Renaissance. There is certainly not a little that is ancient still buried in the soil of the city or beneath its modern buildings. This is the manner in which the past is preserved in historical sites like Rome.

Phantasie Now let us, by a flight of imagination [*phantastische Annahme*][T], suppose that Rome is not a human habitation but a psychical entity with a similarly long and copious past – an entity, that is to say, in which nothing that has once come into existence will have passed away and all the

1 Based on *The Cambridge Ancient History*, 7 (1928): 'The Founding of Rome' by Hugh Last.

earlier phases of development continue to exist alongside the latest one. This would mean that in Rome the palaces of the Caesars and the Septizonium of Septimius Severus would still be rising to their old height on the Palatine and that the castle of S. Angelo would still be carrying on its battlements the beautiful statues which graced it until the siege by the Goths, and so on. But more than this. In the place occupied by the Palazzo Caffarelli would once more stand – without the Palazzo having to be removed – the Temple of Jupiter Capitolinus; and this not only in its latest shape, as the Romans of the Empire saw it, but also in its earliest one, when it still showed Etruscan forms and was ornamented with terracotta antefixes. Where the Coliseum now stands we could at the same time admire Nero's vanished Golden House. On the Piazza of the Pantheon we should find not only the Pantheon of today, as it was bequeathed to us by Hadrian, but, on the same site, the original edifice erected by Agrippa; indeed, the same piece of ground would be supporting the church of Santa Maria sopra Minerva and the ancient temple over which it was built. And the observer would perhaps only have to change the direction of his glance or his position in order to call up the one view or the other.

There is clearly no point in spinning our phantasy [*Phantasie*] any further, for it leads to things that are unimaginable and even absurd. If we want to represent historical sequence in spatial terms we can only do it by juxtaposition in space: the same space cannot have two different contents. Our attempt seems to be an idle game. It has only one justification. It shows us how far we are from mastering the characteristics of mental life by representing them in pictorial terms. [71]

There is one further objection which has to be considered. The question may be raised why we chose precisely the past of a *city* to compare with the past of the mind. The assumption that everything past is preserved holds good even in mental life only on condition that the organ of the mind has remained intact and that its tissues have not been damaged by trauma or inflammation. But destructive influences which can be compared to causes of illness like these are never lacking in the history of a city, even if it has had a less chequered past than Rome, and even if, like London, it has hardly ever suffered from the visitations of an enemy. Demolitions and replacement of buildings occur in the course of the most peaceful development of a city. A city is thus *a priori* unsuited for a comparison of this sort with a mental organism.

We bow to this objection; and, abandoning our attempt to draw a striking contrast, we will turn instead to what is after all a more closely

related object of comparison – the body of an animal or a human being. But here, too, we find the same thing. The earlier phases of development are in no sense still preserved; they have been absorbed into the later phases for which they have supplied the material. The embryo cannot be discovered in the adult. The thymus gland of childhood is replaced after puberty by connective tissue, but is no longer present itself; in the marrow bones of the grown man I can, it is true, trace the outline of the child's bone, but it itself has disappeared, having lengthened and thickened until it has attained its definitive form. The fact remains that only in the mind is such a preservation of all the earlier stages alongside of the final form possible, and that we are not in a position to represent this phenomenon in pictorial terms.

Perhaps we are going too far in this. Perhaps we ought to content ourselves with asserting that what is past in mental life *may* be preserved and is not *necessarily* destroyed. It is always possible that even in the mind some of what is old is effaced or absorbed – whether in the normal course of things or as an exception – to such an extent that it cannot be restored or revivified by any means; or that preservation in general is
[72] dependent on certain favourable conditions. It is possible, but we know nothing about it. We can only hold fast to the fact that it is rather the rule than the exception for the past to be preserved in mental life.

Thus we are perfectly willing to acknowledge that the 'oceanic' feeling exists in many people, and we are inclined to trace it back to an early phase of ego feeling. The further question then arises, what claim this feeling has to be regarded as the source of religious needs.

To me the claim does not seem compelling. After all, a feeling can only be a source of energy if it is itself the expression of a strong need. The derivation of religious needs from the infant's helplessness and the longing for the father aroused by it seems to me incontrovertible, especially since the feeling is not simply prolonged from childhood days, but is permanently sustained by fear [*Angst*]^{T} of the superior power of Fate [*Schicksals*]^{T}. I cannot think of any need in childhood as strong as the need for a father's protection. Thus the part played by the oceanic feeling, which might seek something like the restoration of limitless narcissism, is ousted from a place in the foreground. The origin of the religious attitude can be traced back in clear outlines as far as the feeling of infantile helplessness. There may be something further behind that, but for the present it is wrapped in obscurity.

I can imagine that the oceanic feeling became connected with religion later on [*nachträglich*]. The 'oneness with the universe' which

constitutes its ideational content sounds like a first attempt at a religious consolation, as though it were another way of disclaiming the danger which the ego recognizes as threatening it from the external world. Let me admit once more that it is very difficult for me to work with these almost intangible quantities. Another friend of mine,[1] whose insatiable craving for knowledge has led him to make the most unusual experiments and has ended by giving him encyclopaedic knowledge, has assured me that through the practices of Yoga, by withdrawing from the world, by fixing the attention on bodily functions and by peculiar methods of breathing, one can in fact evoke new sensations and coenaesthesias in oneself, which he regards as regressions to primordial states of mind which have long ago been overlaid. He sees in them a physiological basis, as it were, of much of the wisdom of mysticism. It would not be hard to find connections here with a number of obscure [73]
modifications of mental life, such as trances and ecstasies. But I am moved to exclaim in the words of Schiller's diver:

'. . . Es freue sich,
Wer da atmet im rosigten Licht.'[2]

1 [The editors of the *Oeuvres complètes de Freud* suggest that this may refer to Frederick Eckstein, the 'Philosopher of the Ringstrasse', who was a Buddhist monk for a time.]

2 ['Let him rejoice who breathes up here in the roseate light!' Schiller, 'Der Taucher'.]

II

[74] In my *Future of an Illusion* [1927*c*] I was concerned much less with the deepest sources of the religious feeling than with what the common man understands by his religion – with the system of doctrines and promises which, on the one hand, explains to him the riddles of this world with enviable completeness, and, on the other, assures him that a careful Providence will watch over his life and will compensate him in a future existence for any frustrations he suffers here. The common man cannot imagine this Providence otherwise than in the figure of an enormously exalted father. Only such a being can understand the needs of the children of men and be softened by their prayers and placated by the signs of their remorse. The whole thing is so patently infantile, so foreign to reality, that to anyone with a friendly attitude to humanity it is painful to think that the great majority of mortals will never be able to rise above this view of life. It is still more humiliating to discover how large a number of people living today, who cannot but see that this religion is not tenable, nevertheless try to defend it piece by piece in a series of pitiful rearguard actions. One would like to mix among the ranks of the believers in order to meet these philosophers, who think they can rescue the God of religion by replacing him with an impersonal, shadowy and abstract principle, and to address them with the warning words: 'Thou shalt not take the name of the Lord thy God in vain!' And if some of the great men of the past acted in the same way, no appeal can be made to their example: we know why they were obliged to.

Let us return to the common man and to his religion – the only religion which ought to bear that name. The first thing that we think of is the well-known saying of one of our great poets and thinkers concerning the relation of religion to art and science:

> Wer Wissenschaft und Kunst besitzt, hat auch Religion;
> Wer jene beiden nicht besitzt, der habe Religion![1]

[75] This saying, on the one hand, draws an antithesis between religion and the two highest achievements of man, and, on the other, asserts that, as regards their value in life, those achievements and religion can represent or replace each other. If we also set out to deprive the common man [who has neither science nor art] of his religion, we shall

1 ['He who possesses science and art also has religion; but he who possesses neither of those two, let him have religion!'] – Goethe, *Zahme Xenien* IX (Gedichte aus dem Nachlass).

clearly not have the poet's authority on our side. We will choose a particular path to bring us nearer an appreciation of his words. Life, as we find it, is too hard for us; it brings us too many pains, disappointments and impossible tasks. In order to bear it we cannot dispense with palliative measures. 'We simply cannot do without auxiliary constructions', as Theodor Fontane tells us.[1] There are perhaps three such measures: powerful deflections, which cause us to make light of our misery; substitutive satisfactions, which diminish it; and intoxicating substances, which make us insensitive to it. Something of the kind is indispensable.[2] Voltaire has deflections in mind when he ends *Candide* with the advice to cultivate one's garden; and scientific activity is a deflection of this kind, too. The substitutive satisfactions, as offered by art, are illusions in contrast with reality, but they are nonetheless psychically effective, thanks to the role which phantasy has assumed in mental life. The intoxicating substances influence our body and alter its chemistry. It is no simple matter to see where religion has its place in this series. We must look further afield.

The question of the purpose of human life has been raised countless times; it has never yet received a satisfactory answer and perhaps does not admit of one. Some of those who have asked it have added that if it should turn out that life has *no* purpose, it would lose all value for them. But this threat alters nothing. It looks, on the contrary, as though one had a right to dismiss the question, for it seems to derive from the human presumptuousness, many other manifestations of which are already familiar to us. Nobody talks about the purpose of the life of animals, unless, perhaps, it may be supposed to lie in being of service to man. But this view is not tenable either, for there are many animals of which man can make nothing, except to describe, classify and study them; and innumerable species of animals have escaped even this use, [76]
since they existed and became extinct before man set eyes on them. Once again, only religion can answer the question of the purpose of life. One can hardly be wrong in concluding that the idea of life having a purpose stands and falls with the religious system.

We will therefore turn to the less ambitious question of what men themselves show by their behaviour to be the purpose and intention of their lives. What do they demand of life and wish to achieve in it? The answer to this can hardly be in doubt. They strive for happiness; they

1 [In his novel *Effi Briest* (1895).]

2 In *Die fromme Helene*, Wilhelm Busch has said the same thing on a lower plane: 'Wer Sorgen hat, hat auch Likör.' ['He who has cares has brandy too.']

want to become happy and to remain so. This endeavour has two sides, a positive and a negative aim. It aims, on the one hand, at an absence of pain and unpleasure, and, on the other, at the experiencing of strong feelings of pleasure. In its narrower sense the word 'happiness' only relates to the last. In conformity with this dichotomy in his aims, man's activity develops in two directions, according as it seeks to realize – in the main, or even exclusively – the one or the other of these aims.

As we see, what decides the purpose of life is simply the programme of the pleasure principle. This principle dominates the operation of the mental apparatus from the start. There can be no doubt about its efficacy, and yet its programme is at loggerheads with the whole world, with the macrocosm as much as with the microcosm. There is no possibility at all of its being carried through; all the regulations of the universe run counter to it. One feels inclined to say that the intention that man should be 'happy' is not included in the plan of 'Creation'. What we call happiness in the strictest sense comes from the (preferably sudden) satisfaction of needs which have been dammed up to a high degree, and it is from its nature only possible as an episodic phenomenon. When any situation that is desired by the pleasure principle is prolonged, it produces only a feeling of mild contentment. We are so made that we can derive intense enjoyment only from a contrast and very little from a state of things.[1] Thus our possibilities of happiness are already restricted by our constitution. Unhappiness is much less difficult to experience. We are threatened with suffering from three directions: from our own body, which is doomed to decay and dissolution and which cannot even do without pain and anxiety as warning signals; from the external world, which may rage against us with overwhelming and merciless forces of destruction; and finally from our relations to other men. The suffering which comes from this last source is perhaps more painful to us than any other. We tend to regard it as a kind of gratuitous addition, although it cannot be any less fatefully inevitable than the suffering which comes from elsewhere.

[77]

It is no wonder if, under the pressure of these possibilities of suffering, men are accustomed to moderate their claims to happiness – just as the pleasure principle itself, indeed, under the influence of the

1 Goethe, indeed, warns us that 'nothing is harder to bear than a succession of fair days'.

[Alles in der Welt lässt sich ertragen,
Nur nicht eine Reihe von schönen
Tagen.
(Weimar, 1810–12.)]

But this may be an exaggeration.

external world, changed into the more modest reality principle – if a man thinks himself happy merely to have escaped unhappiness or to have survived his suffering, and if in general the task of avoiding suffering pushes that of obtaining pleasure into the background. Reflection shows that the accomplishment of this task can be attempted along very different paths; and all these paths have been recommended by the various schools of worldly wisdom and put into practice by men. An unrestricted satisfaction of every need presents itself as the most enticing method of conducting one's life, but it means putting enjoyment before caution, and soon brings its own punishment. The other methods, in which avoidance of unpleasure is the main purpose, are differentiated according to the source of unpleasure to which their attention is chiefly turned. Some of these methods are extreme and some moderate; some are one-sided and some attack the problem simultaneously at several points. Against the suffering which may come upon one from human relationships the readiest safeguard is voluntary isolation, keeping oneself aloof from other people. The happiness which can be achieved along this path is, as we see, the happiness of quietness. Against the dreaded external world one can defend oneself only by some kind of turning away from it, if one intends to solve the task by oneself. There is, indeed, another and better path: that of becoming a member of the human community, and, with the help of a technique guided by science, going over to the attack against nature and subjecting her to the human will. Then one is working with all for the good of all. But the most interesting methods of averting suffering [78] are those which seek to influence our own organism. In the last analysis, all suffering is nothing else than sensation; it exists only insofar as we feel it, and we feel it only in consequence of certain ways in which our organism is regulated.

The crudest, but also the most effective among these methods of influence is the chemical one – intoxication. I do not think that anyone completely understands its mechanism, but it is a fact that there are foreign substances which, when present in the blood or tissues, directly cause us pleasurable sensations; and they also so alter the conditions governing our sensibility that we become incapable of receiving unpleasurable impulses. The two effects not only occur simultaneously, but seem to be intimately bound up with each other. But there must be substances in the chemistry of our own bodies which have similar effects, for we know at least one pathological state, mania, in which a condition similar to intoxication arises without the administration of

any intoxicating drug.[1] Besides this, our normal mental life exhibits oscillations between a comparatively easy liberation of pleasure and a comparatively difficult one, parallel with which there goes a diminished or an increased receptivity to unpleasure. It is greatly to be regretted that this toxic side of mental processes has so far escaped scientific examination. The service rendered by intoxicating media in the struggle for happiness and in keeping misery at a distance is so highly prized as a benefit that individuals and peoples alike have given them an established place in the economics of their libido. We owe to such media not merely the immediate yield of pleasure, but also a greatly desired degree of independence from the external world. For one knows that, with the help of this 'drowner of cares',[2] one can at any time withdraw from the pressure of reality and find refuge in a world of one's own with better conditions of sensibility. As is well known, it is precisely this property of intoxicants which also determines their danger and their injuriousness. They are responsible, in certain circumstances, for the useless waste of a large quota of energy which might have been employed for the improvement of the human lot.

The complicated structure [*Bau*][T] of our mental apparatus admits, however, of a whole number of other influences. Just as a satisfaction
[79] of drive spells happiness for us, so severe suffering is caused us if the external world lets us starve, if it refuses to sate our needs. One may therefore hope to be freed from a part of one's sufferings by influencing the drive impulses. This type of defence against suffering is no longer brought to bear on the sensory apparatus; it seeks to master the internal sources of our needs. The extreme form of this is brought about by killing off the drives, as is prescribed by the worldly wisdom of the East and practised by Yoga. If it succeeds, then the subject has, it is true, given up all other activities as well – he has sacrificed his life; and, by another path, he has once more only achieved the happiness of quietness. We follow the same path when our aims are less extreme and we merely attempt to *control* [*Beherrschung*] the life of our drives. In that case, the controlling elements are the higher psychical agencies, which have subjected themselves to the reality principle. Here the aim of

1 [Continuities between neuroses and states of toxicity and intoxication were periodically noted in Freud's writings, from the first to the last (e.g. 1950*a*, Letter 18 [1894], *RSE*, **1**, 216 f.; 1925*e*, *RSE*, **19**, 212–13). Closely related are his repeated comments on the chemical basis of sexuality and the neuroses (e.g. 1905*d* [and 1920], *RSE*, **7**, 190 f.; 1905*e*, ibid., 100), and his anticipations of 'undreamt-of possibilities' in chemical modes of therapy (1940*a* [1938]), ibid., **23**, 164.]

2 ['*Sorgenbrecher*.' The allusion is to a line from Goethe's *West-östlicher Divan*:
'Für sorgt das liebe Leben,
Und Sorgenbrecher sind die Reben.']

satisfaction is not by any means relinquished; but a certain amount of protection against suffering is secured, in that non-satisfaction is not so painfully felt in the case of drives kept in dependence as in the case of uninhibited [*ungehemmten*][T] ones. As against this, there is an undeniable diminution in the potentialities of enjoyment. The feeling of happiness derived from the satisfaction of a wild drive impulse untamed by the ego is incomparably more intense than that derived from sating a drive that has been tamed. The irresistibility of perverse drives, and perhaps the attraction in general of forbidden things, finds an economic explanation here. *Hemmung*

Another technique for fending off suffering is the employment of the displacements of libido [*Libidoverschiebungen*][T] which our mental apparatus permits of and through which its function gains so much in flexibility. The task here is that of shifting the drive aims in such a way that they cannot come up against frustration [*Versagung*][T] from the external world. In this, sublimation of the drives lends its assistance. One gains the most if one can sufficiently heighten the yield of pleasure from the sources of psychical and intellectual work. When that is so, fate can do little against one. A satisfaction of this kind, such as an artist's joy in creating, in giving his phantasies body, or a scientist's in solving problems or discovering truths, has a special quality which we shall certainly one day be able to characterize in metapsychological terms. At present we can say only figuratively that such satisfactions seem 'finer and higher'. But their intensity is mild as compared with that derived from the sating of crude and primary drive impulses; it [80] does not convulse our physical being. And the weak point of this method is that it is not applicable generally: it is accessible to only a few people. It presupposes the possession of special dispositions and gifts which are far from being common to any practical degree. And even to the few who do possess them, this method cannot give complete protection from suffering. It creates no impenetrable armour against the arrows of fortune, and it habitually fails when the source of suffering is a person's own body.[1] *Verschiebung*

1 When there is no special disposition in a person which imperatively prescribes what direction his interests in life shall take, the ordinary professional work that is open to everyone can play the part assigned to it by Voltaire's wise advice [p. 69 above]. It is not possible, within the limits of a short survey, to discuss adequately the significance of work for the economics of the libido. No other technique for the conduct of life attaches the individual so firmly to reality as laying emphasis on work; for his work at least gives him a secure place in a portion of reality, in the human community. The possibility it offers of displacing a large amount of libidinal components, whether narcissistic, aggressive or even erotic, on to professional work and on to the human relations connected with it lends it a value by no means second to what it enjoys as something indispensable to the preservation and justification of existence in society. Professional activity

While this procedure already clearly shows an intention of making oneself independent of the external world by seeking satisfaction in internal, psychical processes, the next procedure brings out those features yet more strongly. In it, the connection with reality is still further loosened; satisfaction is obtained from illusions, which are recognized as such without the discrepancy between them and reality being allowed to interfere with enjoyment. The region from which these illusions arise is the life of the imagination [*Phantasielebens*]; at the time when the development of the sense of reality took place, this region was expressly exempted from the demands of reality-testing and was set apart for the purpose of fulfilling wishes which were difficult to carry out. At the head of these satisfactions through phantasy stands the enjoyment of works
[81] of art – an enjoyment which, by the agency of the artist, is made accessible even to those who are not themselves creative.[1] People who are receptive to the influence of art cannot set too high a value on it as a source of pleasure and consolation in life. Nevertheless, the mild narcosis induced in us by art can do no more than bring about a transient withdrawal from the pressure of vital needs, and it is not strong enough to make us forget real misery.

Another procedure operates more energetically and more thoroughly. It regards reality as the sole enemy and as the source of all suffering, with which it is impossible to live, so that one must break off all relations with it if one is to be in any way happy. The hermit turns his back on the world and will have no truck with it. But one can do more than that; one can try to re-create the world, to build up in its stead another world in which its most unbearable features are eliminated and replaced by others that are in conformity with one's own wishes. But whoever, in desperate defiance, sets out upon this path to happiness will as a rule attain nothing. Reality is too strong for him. He becomes a madman, who for the most part finds no-one to help him in carrying through his delusion. It is asserted, however, that each one of us behaves in some one respect like a paranoic, corrects some aspect of the world which is unbearable to him by the construction of a wish and introduces this delusion into reality. A special importance attaches to the case in which

is a source of special satisfaction if it is a freely chosen one – if, that is to say, by means of sublimation, it makes possible the use of existing inclinations, of persisting or constitutionally reinforced drive impulses. And yet, as a path to happiness, work is not highly prized by men. They do not strive for it as they do for other possibilities of satisfaction. The great majority of people work only under the stress of necessity, and this natural human aversion to work raises most difficult social problems.

1 Cf. 'Formulations on the Two Principles of Mental Functioning' (1911*b*) [*RSE*, **12**, 215 ff.], and Lecture XXIII of my *Introductory Lectures* (1916–17*a*) [ibid., **16**, 316 ff.].

this attempt to procure a certainty of happiness and a protection against suffering through a delusional remoulding of reality is made by a considerable number of people in common. The religions of mankind must be classed among the mass delusions [*Massenwahn*][T] of this kind. *Masse* No-one, needless to say, who shares a delusion ever recognizes it as such.

I do not think that I have made a complete enumeration of the methods by which men strive to gain happiness and keep suffering away and I know, too, that the material might have been differently arranged. One procedure I have not yet mentioned – not because I have forgotten it but because it will concern us later in another connection. And how could one possibly forget, of all others, this technique in the art of living? It is conspicuous for a most remarkable combination of characteristic features. It, too, aims of course at making the subject independent of Fate (as it is best to call it), and to that [82] end it locates satisfaction in internal mental processes, making use, in so doing, of the displaceability of the libido of which we have already spoken [p. 73 above]. But it does not turn away from the external world; on the contrary, it clings to the objects belonging to that world and obtains happiness from an emotional relationship to them. Nor is it content to aim at an avoidance of unpleasure – a goal, as we might call it, of weary resignation; it passes this by without heed and holds fast to the original, passionate striving for a positive fulfilment of happiness. And perhaps it does in fact come nearer to this goal than any other method. I am, of course, speaking of the way of life which makes love the centre of everything, which looks for all satisfaction in loving and being loved. A psychical attitude of this sort comes naturally enough to all of us; one of the forms in which love manifests itself – sexual [*geschlechtliche*][T] love – has given us our most intense *Geschlecht* experience of an overwhelming sensation of pleasure and has thus furnished us with a pattern for our search for happiness. What is more natural than that we should persist in looking for happiness along the path on which we first encountered it? The weak side of this technique of living is easy to see; otherwise no human being would have thought of abandoning this path to happiness for any other. It is that we are never so defenceless against suffering as when we love, never so helplessly unhappy as when we have lost our loved object or its love. But this does not dispose of the technique of living based on the value of love as a means to happiness. There is much more to be said about it. [See below, p. 92.]

We may go on from here to consider the interesting case in which happiness in life is predominantly sought in the enjoyment of beauty, wherever beauty presents itself to our senses and our judgement – the beauty of human forms and gestures, of natural objects and landscapes and of artistic and even scientific creations. This aesthetic attitude to the goal of life offers little protection against the threat of suffering, but it can compensate for a great deal. The enjoyment of beauty has a peculiar, mildly intoxicating quality of feeling. Beauty has no obvious use; nor is there any clear cultural necessity for it. Yet civilization could not do without it. The science of aesthetics investigates the conditions under which things are felt as beautiful, but it has been unable to give any
[83] explanation of the nature and origin of beauty, and, as usually happens, lack of success is concealed beneath a flood of resounding and empty words. Psychoanalysis, unfortunately, has scarcely anything to say about beauty either. All that seems certain is its derivation from the field of sexual feeling [*Sexualempfindens*]. The love of beauty seems a perfect example of an impulse inhibited in its aim. 'Beauty' and 'attraction'[1] are originally attributes of the sexual object [*Sexualobjekts*]. It is worth remarking that the genitals themselves, the sight of which is always exciting, are nevertheless hardly ever judged to be beautiful; the quality of beauty seems, instead, to attach to certain secondary sexual characters.

In spite of the incompleteness [of my enumeration (p. 75 above)], I will venture on a few remarks as a conclusion to our enquiry. The programme of becoming happy, which the pleasure principle imposes on us [p. 70], cannot be fulfilled; yet we must not – indeed, we cannot – give up our efforts to bring it nearer to fulfilment by some means or other. Very different paths may be taken in that direction, and we may give priority either to the positive aspect of the aim, that of gaining pleasure, or to its negative one, that of avoiding unpleasure. By none of these paths can we attain all that we desire. Happiness, in the reduced sense in which we recognize it as possible, is a problem of the economics of the individual's libido. There is no golden rule which applies to everyone: every man must find out for himself in what particular fashion he can be saved.[2] All kinds of different factors will operate to direct his

1 [The German '*Reiz*' means 'stimulus' as well as 'charm' or 'attraction'. Freud had argued on the same lines in the first edition of his *Three Essays* (1905*d*), *RSE*, **7**, 185 f., as well as in a footnote added to that work in 1915; ibid., 139 *n.* 2.]

2 [The allusion is to a saying attributed to Frederick the Great: 'in my State every man can be saved after his own fashion.' Freud had quoted this a short time before, in *Lay Analysis* (1926*e*), ibid., **20**, 210.]

choice. It is a question of how much real satisfaction he can expect to get from the external world, how far he is led to make himself independent of it, and, finally, how much strength he feels he has for altering the world to suit his wishes. In this, his psychical constitution will play a decisive part, irrespectively of the external circumstances. The man who is predominantly erotic will give first preference to his emotional relationships to other people; the narcissistic man, who inclines to be self-sufficient, will seek his main satisfactions in his internal mental processes; the man of action will never give up the external world on which he can try out his strength.[1] As regards the second of these types, the nature of his talents and the amount of drive sublimation open to him will decide where he shall locate his interests. Any choice that is pushed to an extreme will be penalized by exposing the individual to the dangers which arise if a technique of living that has been chosen as an exclusive one should prove inadequate. Just as a cautious businessman avoids tying up all his capital in one concern, so, perhaps, worldly wisdom will advise us not to look for the whole of our satisfaction from a single aspiration. Its success is never certain, for that depends on the convergence of many factors, perhaps on none more than on the capacity of the psychical constitution to adapt its function to the environment and then to exploit that environment for a yield of pleasure. A person who is born with a specially unfavourable drive constitution, and who has not properly undergone the transformation and rearrangement of his libidinal components which is indispensable for later achievements, will find it hard to obtain happiness from his external situation, especially if he is faced with tasks of some difficulty. As a last technique of living, which will at least bring him substitutive satisfactions, he is offered that of a flight into neurotic illness – a flight which he usually accomplishes when he is still young. The man who sees his pursuit of happiness come to nothing in later years can still find consolation in the yield of pleasure of chronic intoxication; or he can embark on the desperate attempt at rebellion seen in a psychosis.[2] [84]

Religion restricts this play of choice and adaptation, since it imposes equally on everyone its own path to the acquisition of happiness and protection from suffering. Its technique consists in depressing the value

1 [Freud further develops his ideas on these different types in his paper on 'Libidinal Types' (1931*a*), p. 207 ff. below.]

2 [*Footnote added* 1931:] I feel impelled to point out one at least of the gaps that have been left in the account given above. No discussion of the possibilities of human happiness should omit to take into consideration the relation between narcissism and object libido. We need to know what being essentially self-dependent signifies for the economics of the libido.

of life and distorting the picture of the real world in a delusional manner – which presupposes an intimidation of the intelligence. At this price,
[85] by forcibly fixing them in a state of psychical infantilism and by drawing them into a mass delusion, religion succeeds in sparing many people an individual neurosis.[1] But hardly anything more. There are, as we have said, many paths which *may* lead to such happiness as is attainable by men, but there is none which does so for certain. Even religion cannot keep its promise. If the believer finally sees himself obliged to speak of God's 'inscrutable decrees', he is admitting that all that is left to him as a last possible consolation and source of pleasure in his suffering is an unconditional submission. And if he is prepared for that, he could probably have spared himself the detour he has made.

1 [Cf. pp. 40–1 and 41 *n.* 4 above.]

III

Our enquiry concerning happiness has not so far taught us much that is [86]
not already common knowledge. And even if we proceed from it to the problem of why it is so hard for men to be happy, there seems no greater prospect of learning anything new. We have given the answer already [p. 70 above] by pointing to the three sources from which our suffering comes: the superior power of nature, the feebleness of our own bodies and the inadequacy of the regulations which adjust the mutual relationships of human beings in the family, the State and society. In regard to the first two sources, our judgement cannot hesitate long. It forces us to acknowledge those sources of suffering and to submit to the inevitable. We shall never completely master nature; and our bodily organism, itself a part of that nature, will always remain a transient structure with a limited capacity for adaptation and performance. This recognition does not have a paralysing effect. On the contrary, it points the direction for our activity. If we cannot remove all suffering, we can remove some, and we can mitigate some: the experience of many thousands of years has convinced us of that. As regards the third source, the social source of suffering, our attitude is a different one. We do not admit it at all; we cannot see why the regulations made by ourselves should not, on the contrary, be a protection and a benefit for every one of us. And yet, when we consider how unsuccessful we have been in precisely this field of prevention of suffering, a suspicion dawns on us that here, too, a piece of unconquerable nature may lie behind – this time a piece of our own psychical constitution.

When we start considering this possibility, we come upon a contention which is so astonishing that we must dwell upon it. This contention holds that what we call our civilization [*Kultur*] is largely responsible for our misery [*Elend*], and that we should be much happier if we gave it up and returned to primitive conditions. I call this contention astonishing because, in whatever way we may define the concept of civilization, it is a certain fact that all the things with which we seek to protect ourselves against the threats that emanate from the sources of suffering are part of that very civilization.

How has it happened that so many people have come to take up this [87]
strange attitude of hostility to civilization?[1] I believe that the basis of it

1 [Freud had discussed this question at considerable length two years earlier, in the opening chapters of *The Future of an Illusion* (1927*c*); see p. 5 ff. above.]

was a deep and long-standing dissatisfaction with the then existing state of civilization and that on that basis a condemnation of it was built up, occasioned by certain specific historical events. I think I know what the last and the last but one of those occasions were. I am not learned enough to trace the chain of them far back enough in the history of the human species; but a factor of this kind hostile to civilization must already have been at work in the victory of Christendom over the heathen religions. For it was very closely related to the low estimation put upon earthly life by the Christian doctrine. The last but one of these occasions was when the progress of voyages of discovery led to contact with primitive peoples and races. In consequence of insufficient observation and a mistaken view of their manners and customs, they appeared to Europeans to be leading a simple, happy life with few wants, a life such as was unattainable by their visitors with their superior civilization. Later experience has corrected some of those judgements. In many cases the observers had wrongly attributed to the absence of complicated cultural demands what was in fact due to the bounty of nature and the ease with which the major human needs were satisfied. The last occasion is especially familiar to us. It arose when people came to know about the mechanism of the neuroses, which threaten to undermine the modicum of happiness enjoyed by civilized men. It was discovered that a person becomes neurotic because he cannot tolerate the amount of frustration [*Versagung*] which society imposes on him in the service of its cultural ideals, and it was inferred from this that the abolition or reduction of those demands would result in a return to possibilities of happiness.

There is also an added factor of disappointment. During the last few generations mankind has made an extraordinary advance in the natural sciences and in their technical application and has established his control over nature in a way never before imagined. The single steps of this advance are common knowledge and it is unnecessary to enumerate them. Men are proud of those achievements, and have a right to be. But
[88] they seem to have observed that this newly won power over space and time, this subjugation of the forces of nature, which is the fulfilment of a longing that goes back thousands of years, has not increased the amount of pleasurable satisfaction which they may expect from life and has not made them feel happier. From the recognition of this fact we ought to be content to conclude that power over nature is not the *only* precondition of human happiness, just as it is not the *only* goal of cultural endeavour; we ought not to infer from it that technical progress

is without value for the economics of our happiness. One would like to ask: is there, then, no positive gain in pleasure, no unequivocal increase in my feeling of happiness, if I can, as often as I please, hear the voice of a child of mine who is living hundreds of miles away or if I can learn in the shortest possible time after a friend has reached his destination that he has come through the long and difficult voyage unharmed? Does it mean nothing that medicine has succeeded in enormously reducing infant mortality and the danger of infection for women in childbirth, and, indeed, in considerably lengthening the average life of a civilized man? And there is a long list that might be added to benefits of this kind which we owe to the much-despised era of scientific and technical advances. But here the voice of pessimistic criticism makes itself heard and warns us that most of these satisfactions follow the model of the 'cheap enjoyment' extolled in the anecdote – the enjoyment obtained by putting a bare leg from under the bedclothes on a cold winter night and drawing it in again. If there had been no railway to conquer distances, my child would never have left his native town and I should need no telephone to hear his voice; if travelling across the ocean by ship had not been introduced, my friend would not have embarked on his sea voyage and I should not need a cable to relieve my anxiety about him. What is the use of reducing infantile mortality when it is precisely that reduction which imposes the greatest restraint on us in the begetting of children, so that, taken all round, we nevertheless rear no more children than in the days before the reign of hygiene, while at the same time we have created difficult conditions for our sexual life in marriage, and have probably worked against the beneficial effects of natural selection? And, finally, what good to us is a long life if it is difficult and barren of joys, and if it is so full of misery that we can only welcome death as a deliverer?

It seems certain that we do not feel comfortable in our present-day [89] civilization, but it is very difficult to form an opinion whether and in what degree men of an earlier age felt happier and what part their cultural conditions played in the matter. We shall always tend to consider people's distress objectively – that is, to place ourselves, with our own wants and sensibilities, in *their* conditions, and then to examine what occasions we should find in them for experiencing happiness or unhappiness. This method of looking at things, which seems objective because it ignores the variations in subjective sensibility, is, of course, the most subjective possible, since it puts one's own mental states in the place of any others, unknown though they may be. Happiness, however, is

something essentially subjective. No matter how much we may shrink with horror from certain situations – of a galley-slave in antiquity, of a peasant during the Thirty Years' War, of a victim of the Holy Inquisition, of a Jew awaiting a pogrom – it is nevertheless impossible for us to feel our way into such people – to divine the changes which original obtuseness of mind, a gradual stupefying process, the cessation of expectations, and cruder or more refined methods of narcotization have produced upon their receptivity to sensations of pleasure and unpleasure. Moreover, in the case of the most extreme possibility of suffering, special mental protective devices are brought into operation. It seems to me unprofitable to pursue this aspect of the problem any further.

It is time for us to turn our attention to the nature of this civilization on whose value as a means to happiness doubts have been thrown. We shall not look for a formula in which to express that nature in a few words, until we have learnt something by examining it. We shall therefore content ourselves with saying once more that the word 'civilization' ['*Kultur*'][1] describes the whole sum of the achievements and the regulations which distinguish our lives from those of our animal ancestors and which serve two purposes – namely to protect men against nature and to adjust their mutual relations.[2] In order to learn more, we will bring together the various features of civilization individually, as they are exhibited in human communities. In doing so, we shall have no [90] hesitation in letting ourselves be guided by linguistic usage or, as it is also called, linguistic feeling, in the conviction that we shall thus be doing justice to inner discernments which still defy expression in abstract terms.

The first stage is easy. We recognize as cultural all activities and resources which are useful to men for making the earth serviceable to them, for protecting them against the violence of the forces of nature, and so on. As regards this side of civilization, there can be scarcely any doubt. If we go back far enough, we find that the first acts of civilization were the use of tools, the gaining of control over fire and the construction of dwellings. Among these, the control over fire stands out as a quite extraordinary and unprecedented achievement,[3] while the others

1 [For the translation of this word see the Editors' Note to *The Future of an Illusion*, p. 4 above, and *RSE*, **24**, 74.]

2 See *The Future of an Illusion* [p. 6 above].

3 Psychoanalytic material, incomplete as it is and not susceptible to clear interpretation, nevertheless admits of a conjecture – a fantastic-sounding one – about the origin of this human feat. It is as though primal man had the habit, when he came into contact with fire, of satisfying an infantile desire connected with it, by putting it out with a stream of his urine. The legends that we possess leave no doubt about the originally phallic view taken of tongues of flame as they

opened up paths which man has followed ever since, and the stimulus to which is easily guessed. With every tool man is perfecting his own organs, whether motor or sensory, or is removing the limits to their functioning. Motor power places gigantic forces at his disposal, which, like his muscles, he can employ in any direction; thanks to ships and aircraft neither water nor air can hinder his movements; by means of spectacles he corrects defects in the lens of his own eye; by means of the telescope he sees into the far distance; and by means of the microscope [91]
he overcomes the limits of visibility set by the structure of his retina. In the photographic camera he has created an instrument which retains the fleeting visual impressions, just as a gramophone disc retains the equally fleeting auditory ones; both are at bottom materializations of the power he possesses of recollection, his memory. With the help of the telephone he can hear at distances which would be respected as unattainable even in a fairy tale. Writing was in its origin the voice of an absent person; and the dwelling house was a substitute for the mother's womb, the first lodging, for which in all likelihood man still longs, and in which he was safe and felt at ease.

These things that, by his science and technology, man has brought about on this earth, on which he first appeared as a feeble animal organism and on which each individual of his species must once more make its entry ('oh inch of nature!'[1]) as a helpless suckling – these things do not only sound like a fairy tale, they are an actual fulfilment

shoot upwards. Putting out fire by micturating – a theme to which modern giants, Gulliver in Lilliput and Rabelais' Gargantua, still hark back – was therefore a kind of sexual act with a male, an enjoyment of sexual potency in a homosexual competition. The first person to renounce this desire and spare the fire was able to carry it off with him and subdue it to his own use. By damping down the fire of his own sexual excitation, he had tamed the natural force of fire. This great cultural conquest was thus the reward for his renunciation of drive. Further, it is as though woman had been appointed guardian of the fire which was held captive on the domestic hearth, because her anatomy made it impossible for her to yield to the temptation of this desire. It is remarkable, too, how regularly analytic experience testifies to the connection between ambition, fire and urethral erotism. – [Freud had pointed to the connection between urination and fire as early as in the 'Dora' case history (1905*e* [1901]), *RSE*, **7**, 63 f. The connection with ambition came rather later. A full list of references can be found in the Editors' Note to the later paper on the subject, 'The Acquisition and Control of Fire' (1932*a*), ibid., **22**, 199 f.]

1 [In English in the original. This very Shakespearean phrase is not in fact to be found in the canon of Shakespeare. The words 'Poore inch of Nature' occur, however, in a novel by George Wilkins, *The Painfull Adventures of Pericles Prince of Tyre*, where they are addressed by Pericles to his infant daughter. This work was first printed in 1608, just after the publication of Shakespeare's play, in which Wilkins has been thought to have had a hand. Freud's unexpected acquaintance with the phrase is explained by its appearance in a discussion of the origins of *Pericles* in Georg Brandes's well-known book on Shakespeare, a copy of the German translation of which had a place in Freud's library (Brandes, 1896). He is known to have greatly admired the Danish critic (cf. Jones, 1957, 120), and the same book is quoted in his paper on the three caskets (1913*f*), *RSE*, **12**, 289.]

of every – or of almost every – fairy-tale wish. All these assets he may lay claim to as his cultural acquisition. Long ago he formed an ideal conception of omnipotence and omniscience which he embodied in his gods. To these gods he attributed everything that seemed unattainable to his wishes, or that was forbidden to him. One may say, therefore, that these gods were cultural ideals. Today he has come very close to the attainment of this ideal, he has almost become a god himself. Only, it is true, in the fashion in which ideals are usually attained according to the general judgement of humanity. Not completely; in some respects not at all, in others only halfway. Man has, as it were, become a kind
[92] of prosthetic God. When he puts on all his auxiliary organs he is truly magnificent; but those organs have not grown on to him and they still give him much trouble at times. Nevertheless, he is entitled to console himself with the thought that this development will not come to an end precisely with the year 1930 A.D. Future ages will bring with them new and probably unimaginably great advances in this field of civilization and will increase man's likeness to God still more. But in the interests of our investigations, we will not forget that present-day man does not feel happy in his Godlike character.

We recognize, then, that countries have attained a high level of civilization if we find that in them everything which can assist in the exploitation of the earth by man and in his protection against the forces of nature – everything, in short, which is of use to him – is attended to and effectively carried out. In such countries rivers which threaten to flood the land are regulated in their flow, and their water is directed through canals to places where there is a shortage of it. The soil is carefully cultivated and planted with the vegetation which it is suited to support; and the mineral wealth below ground is assiduously brought to the surface and fashioned into the required implements and utensils. The means of communication are ample, rapid and reliable. Wild and dangerous animals have been exterminated, and the breeding of domesticated animals flourishes. But we demand other things from civilization besides these, and it is a noticeable fact that we hope to find them realized in these same countries. As though we were seeking to repudiate the first demand we made, we welcome it as a sign of civilization as well if we see people directing their care too to what has no practical value whatever, to what is useless – if, for instance, the green spaces necessary in a town as playgrounds and as reservoirs of fresh air are also laid out with flower-beds, or if the windows of the houses are decorated with pots of flowers. We soon observe that this useless thing which we expect

civilization to value is beauty. We require civilized man to reverence beauty wherever he sees it in nature and to create it in the objects of his handiwork so far as he is able. But this is far from exhausting our demands on civilization. We expect besides to see the signs of cleanliness [93] and order. We do not think highly of the cultural level of an English country town in Shakespeare's time when we read that there was a big dung-heap in front of his father's house in Stratford; we are indignant and call it 'barbarous' (which is the opposite of civilized) when we find the paths in the Wiener Wald[1] littered with paper. Dirtiness of any kind seems to us incompatible with civilization. We extend our demand for cleanliness to the human body too. We are astonished to learn of the objectionable smell which emanated from the *Roi Soleil*;[2] and we shake our heads on the Isola Bella[3] when we are shown the tiny wash-basin in which Napoleon made his morning toilet. Indeed, we are not surprised by the idea of setting up the use of soap as an actual yardstick of civilization. The same is true of order. It, like cleanliness, applies solely to the works of man. But whereas cleanliness is not to be expected in nature, order, on the contrary, has been imitated from her. Man's observation of the great astronomical regularities not only furnished him with a model for introducing order into his life, but gave him the first points of departure for doing so. Order is a kind of compulsion to repeat [*Wiederholungszwang*][T] which, when a regulation has been laid down *Zwang* once and for all, decides when, where and how a thing shall be done, so that in every similar circumstance one is spared hesitation and indecision. The benefits of order are incontestable. It enables men to use space and time to the best advantage, while conserving their psychical forces [*Kräfte*][T]. We should have a right to expect that order would have taken its place in human activities from the start and without difficulty; and we may well wonder that this has not happened – that, on the contrary, human beings exhibit an inborn tendency to carelessness, irregularity and unreliability in their work, and that a laborious training is needed before they learn to follow the example of their celestial models.

Beauty, cleanliness and order obviously occupy a special position among the requirements of civilization. No-one will maintain that they are as important for life as control over the forces of nature or as some other factors with which we shall become acquainted. And yet no-one [94]

1 [The wooded hills on the outskirts of Vienna.]

2 [Louis XIV of France.]

3 [The well-known island in Lake Maggiore visited by Napoleon a few days before the battle of Marengo.]

would care to put them in the background as trivialities. That civilization is not exclusively taken up with what is useful is already shown by the example of beauty, which we decline to omit from among the interests of civilization. The usefulness of order is quite evident. With regard to cleanliness, we must bear in mind that it is demanded of us by hygiene as well, and we may suspect that even before the days of scientific prophylaxis the connection between the two was not altogether strange to man. Yet utility does not entirely explain these efforts; something else must be at work besides.

No feature, however, seems better to characterize civilization than its esteem and encouragement of man's higher mental activities – his intellectual, scientific and artistic achievements – and the leading role that it assigns to ideas in human life. Foremost among those ideas are the religious systems, on whose complicated structure [*Aufbau*] I have endeavoured to throw light elsewhere.[1] Next come the speculations of philosophy; and, finally, what might be called man's 'ideals' [*Idealbildungen*] – his ideas [*Vorstellungen*] of a possible perfection of individuals, or of peoples or of the whole of humanity, and the demands he sets up on the basis of such ideas. The fact that these creations of his are not independent of one another, but are on the contrary closely interwoven, increases the difficulty not only of describing them but of tracing their psychological derivation. If we assume quite generally that the driving force of all human activities is a striving towards the two confluent goals of utility and a yield of pleasure, we must suppose that this is also true of the manifestations of civilization which we have been discussing here, although this is easily visible only in scientific and aesthetic activities. But it cannot be doubted that the other activities, too, correspond to strong needs in men – perhaps to needs which are only developed in a minority. Nor must we allow ourselves to be misled by judgements of value concerning any particular religion, or philosophic system, or ideal. Whether we think to find in them the highest achievements of the human spirit, or whether we deplore them as aberrations, we cannot but recognize that where they are present, and, especially, where they are dominant, a high level of civilization is implied.

The last, but certainly not the least important, of the characteristic
[95] features of civilization remains to be assessed: the manner in which the relationships of men to one another, their social relationships, are regulated – relationships which affect a person as a neighbour, as a source of help, as another person's sexual object, as a member of a family and

1 [Cf. *The Future of an Illusion* (1927*c*), p. 32 ff. above.]

of a State. Here it is especially difficult to keep clear of particular ideal demands and to see what is civilized in general. Perhaps we may begin by explaining that the element of civilization enters on the scene with the first attempt to regulate these social relationships. If the attempt were not made, the relationships would be subject to the arbitrary will of the individual: that is to say, the physically stronger man would decide them in the sense of his own interests and drive impulses. Nothing would be changed in this if this stronger man should in his turn meet someone even stronger than he. Human life in common is only made possible when a majority comes together which is stronger than any separate individual and which remains united against all separate individuals. The power of this community is then set up as 'right' in opposition to the power of the individual, which is condemned as 'brute force'. This replacement of the power of the individual by the power of a community constitutes the decisive step of civilization. The essence of it lies in the fact that the members of the community restrict themselves in their possibilities of satisfaction, whereas the individual knew no such restrictions. The first requisite of civilization, therefore, is that of justice – that is, the assurance that a law once made will not be broken in favour of an individual. This implies nothing as to the ethical value of such a law. The further course of cultural development seems to tend towards making the law no longer an expression of the will of a small community – a caste or a stratum of the population or a racial group – which, in its turn, behaves like a violent individual towards other, and perhaps more numerous, collections of people [*Massen*]. The final outcome should be a rule of law to which all – except those who are not capable of entering a community – have contributed by a sacrifice of their drives, and which leaves no-one – again with the same exception – at the mercy of brute force.

The liberty of the individual is no gift of civilization. It was greatest before there was any civilization, though then, it is true, it had for the most part no value, since the individual was scarcely in a position to defend it. The development of civilization imposes restrictions on it, and justice demands that no-one shall escape those restrictions. What [96]
makes itself felt in a human community as a desire for freedom may be their revolt against some existing injustice, and so may prove favourable to a further development of civilization; it may remain compatible with civilization. But it may also spring from the remains of their original personality, which is still untamed by civilization and may thus become the basis in them of hostility to civilization. The urge for freedom,

therefore, is directed against particular forms and demands of civilization or against civilization altogether. It does not seem as though any influence could induce a man to change his nature into a termite's. No doubt he will always defend his claim to individual liberty against the will of the group [*Masse*]. A good part of the struggles of mankind centre round the single task of finding an expedient accommodation – one, that is, that will bring happiness – between this claim of the individual and the cultural claims of the group; and one of the problems that touches the fate of humanity is whether such an accommodation can be reached by means of some particular form of civilization or whether this conflict is irreconcilable.

By allowing common feeling to be our guide in deciding what features of human life are to be regarded as civilized, we have obtained a clear impression of the general picture of civilization; but it is true that so far we have discovered nothing that is not universally known. At the same time we have been careful not to fall in with the prejudice that civilization is synonymous with perfecting, that it is the road to perfection preordained for men. But now a point of view presents itself which may lead in a different direction. The development of civilization appears to us as a peculiar process which mankind undergoes, and in which several things strike us as familiar. We may characterize this process with reference to the changes which it brings about in the familiar drive dispositions of human beings, to satisfy which is, after all, the economic task of our lives. A few of these drives are used up in such a manner that something appears in their place which, in an individual, we describe as a character trait. The most remarkable example of such a process is found in the anal erotism of young human beings. Their original interest in the excretory function, its organs and products, is changed in the course of their growth into a group of traits which are familiar to us as parsimony,
[97] a sense of order and cleanliness – qualities which, though valuable and welcome in themselves, may be intensified till they become markedly dominant and produce what is called the anal character. How this happens we do not know, but there is no doubt about the correctness of the finding.[1] Now we have seen that order and cleanliness are important requirements of civilization, although their vital necessity is not very apparent, any more than their suitability as sources of enjoyment. At this point we cannot fail to be struck by the similarity between the process of civilization and the libidinal development of the individual.

1 Cf. my 'Character and Anal Erotism' (1908*b*) [*RSE*, **9**, 149 ff.], and numerous further contributions, by Ernest Jones [1918] and others.

Other drives [besides anal erotism] are induced to displace the conditions for their satisfaction, to lead them into other paths. In most cases this process coincides with that of the *sublimation* (of drive aims) with which we are familiar, but in some it can be differentiated from it. Sublimation of drive is an especially conspicuous feature of cultural development; it is what makes it possible for higher psychical activities, scientific, artistic or ideological, to play such an important part in civilized life. If one were to yield to a first impression, one would say that sublimation is a vicissitude which has been forced upon the drives [*Triebschicksal*] entirely by civilization. But it would be wiser to reflect upon this a little longer. In the third place,[1] finally, and this seems the most important of all, it is impossible to overlook the extent to which civilization is built up upon a renunciation of drive, how much it presupposes precisely the non-satisfaction (by suppression, repression or some other means?) of powerful drives. This 'cultural frustration' ['*Kulturversagung*'] dominates the large field of social relationships between human beings. As we already know, it is the cause of the hostility against which all civilizations have to struggle. It will also make severe demands on our scientific work, and we shall have much to explain here. It is not easy to understand how it can become possible to deprive a drive of satisfaction. Nor is doing so without danger. If the loss is not compensated for economically, one can be certain that serious disorders will ensue.

But if we want to know what value can be attributed to our view that the development of civilization is a special process, comparable to the [98]
normal maturation of the individual, we must clearly attack another problem. We must ask ourselves to what influences the development of civilization owes its origin, how it arose, and by what its course has been determined.[2]

1 [Freud had already mentioned two other factors playing a part in the 'process' of civilization: character formation and sublimation.]

2 [Freud returns to the subject of civilization as a 'process' below, on p. 109 and again on p. 125 ff. He mentions it once more in his open letter to Einstein, *Why War?* (1933*b*), *RSE*, **22**, 224.]

IV

[99] The task seems an immense one, and it is natural to feel diffidence in the face of it. But here are such conjectures as I have been able to make.

After primal man had discovered that it lay in his own hands, literally, to improve his lot on earth by working, it cannot have been a matter of indifference to him whether another man worked with or against him. The other man acquired the value for him of a fellow worker, with whom it was useful to live together. Even earlier, in his apelike prehistory, man had adopted the habit of forming families, and the members of his family were probably his first helpers. One may suppose that the founding of families was connected with the fact that a moment came when the need for genital satisfaction no longer made its appearance like a guest who drops in suddenly, and, after his departure, is heard of no more for a long time, but instead took up its quarters as a permanent lodger. When this happened, the male acquired a motive [*Motiv*][T] for keeping the female, or, speaking more generally, his sexual objects, near him; while the female, who did not want to be separated from her helpless young, was obliged, in their interests, to remain with the stronger male.[1] In this primitive family one essential feature of

1 The organic periodicity of the sexual process has persisted, it is true, but its effect on psychical sexual excitation has rather been reversed. This change seems most likely to be connected with the diminution of the olfactory stimuli by means of which the menstrual process produced an effect on the male psyche. Their role was taken over by visual excitations, which, in contrast to the intermittent olfactory stimuli, were able to maintain a permanent effect. The taboo on menstruation is derived from this 'organic repression', as a defence against a phase of development that has been surmounted. All other motives are probably of a secondary nature. (Cf. C. D. Daly, 1927.) This process is repeated on another level when the gods of a superseded period of civilization turn into demons. The diminution of the olfactory stimuli seems itself to be a consequence of man's raising himself from the ground, of his assumption of an upright gait; this made his genitals, which were previously concealed, visible and in need of protection, and so provoked feelings of shame in him.

The fateful process of civilization would thus have set in with man's adoption of an erect posture. From that point the chain of events would have proceeded through the devaluation of olfactory stimuli and the isolation of the menstrual period to the time when visual stimuli were paramount and the genitals became visible, and thence to the continuity of sexual excitation, the founding of the family and so to the threshold of human civilization. This is only a theoretical speculation, but it is important enough to deserve careful checking with reference to the conditions of life which obtain among animals closely related to man.

A social factor is also unmistakably present in the cultural trend towards cleanliness, which has received *ex post facto* [*nachträgliche*] justification in hygienic considerations but which manifested itself before their discovery. The incitement to cleanliness originates in an urge to get rid of the excreta, which have become disagreeable to the sense perceptions. We know that in the nursery things are different. The excreta arouse no disgust in children. They seem valuable to them as being a part of their own body which has come away from it. Here upbringing [*Erziehung*][T] insists with special energy on hastening the course of development which lies ahead,

civilization is still lacking. The arbitrary will of its head, the father, was [100]
unrestricted. In *Totem and Taboo* [1912–13*a*][1] I have tried to show how the way led from this family to the succeeding stage of communal life in the form of bands of brothers. In overpowering their father, the sons had made the discovery that a combination can be stronger than a single individual. The totemic culture is based on the restrictions which the sons had to impose on one another in order to keep this new state of [101]
affairs in being. The taboo observances were the first 'right' or 'law'.[2] The communal life of human beings had, therefore, a twofold foundation: the compulsion to work, which was created by external necessity, and the power of love, which made the man unwilling to be deprived of his sexual object – the woman – and made the woman unwilling to be deprived of the part of herself which had been separated off from her – her child. Eros and Ananke [Love and Necessity] have become the parents of human civilization too. The first result of civilization was that even a fairly large number of people were now able to live together in a community. And since these two great powers were cooperating in this, one might expect that the further development of civilization would proceed smoothly towards an even better control over the external world and towards a further extension of the number of people included in the community. Nor is it easy to understand how this civilization could act upon its participants otherwise than to make them happy.

Before we go on to enquire from what quarter an interference might arise, this recognition of love as one of the foundations of civilization may serve as an excuse for a digression which will enable us to fill in a

and which should make the excreta worthless, disgusting, abhorrent and abominable. Such a reversal of values would scarcely be possible if the substances that are expelled from the body were not doomed by their strong smells to share the fate which overtook olfactory stimuli after man adopted the erect posture. Anal erotism, therefore, succumbs in the first instance to the 'organic repression' which paved the way to civilization. The existence of the social factor which is responsible for the further transformation of anal erotism is attested by the circumstance that, in spite of all man's developmental advances, he scarcely finds the smell of *his own* excreta repulsive, but only that of other people's. Thus a person who is not clean – who does not hide his excreta – is offending other people; he is showing no consideration for them. And this is confirmed by our strongest and commonest terms of abuse. It would be incomprehensible, too, that man should use the name of his most faithful friend in the animal world – the dog – as a term of abuse if that creature had not incurred his contempt through two characteristics: that it is an animal whose dominant sense is that of smell and one which has no horror of excrement, and that it is not ashamed of its sexual functions. [Cf. some remarks on the history of Freud's views on this subject in the Editors' Introduction, p. 56 f. above.]

1 [What Freud here calls the 'primitive family' he speaks of more often as the 'primal horde'; it corresponds to what Atkinson (1903), to whom the notion is largely due, named the 'Cyclopean family'. See, for all this, *RSE*, **13**, 131 ff.]

2 [The German '*Recht*' means both 'right' and 'law'.]

gap which we left in an earlier discussion [p. 75 above]. We said there that man's discovery that sexual [*geschlechtliche*] (genital) love afforded him the strongest experiences of satisfaction, and in fact provided him with the prototype of all happiness, must have suggested to him that he should continue to seek the satisfaction of happiness in his life along the path of sexual [*geschlechtlichen*] relations and that he should make genital erotism the central point of his life. We went on to say that in doing so he made himself dependent in a most dangerous way on a portion of the external world, namely, his chosen love object, and exposed himself to extreme suffering if he should be rejected by that object or should lose it through unfaithfulness or death. For that reason the wise men of every age have warned us most emphatically against this way of life; but in spite of this it has not lost its attraction for a great number of people.

A small minority are enabled by their constitution to find happiness, in spite of everything, along the path of love. But far-reaching mental
[102] changes in the function of love are necessary before this can happen. These people make themselves independent of their object's acquiescence by displacing what they mainly value from being loved on to loving; they protect themselves against the loss of the object by directing their love, not to single objects but to all men alike; and they avoid the uncertainties and disappointments of genital love by turning away from its sexual aims and transforming the drive into an impulse with an *inhibited aim*. What they bring about in themselves in this way is a state of evenly suspended, steadfast, affectionate feeling, which has little external resemblance any more to the stormy agitations of genital love, from which it is nevertheless derived. Perhaps St Francis of Assisi went furthest in thus exploiting love for the benefit of an inner feeling of happiness. Moreover, what we have recognized as one of the techniques for fulfilling the pleasure principle has often been brought into connection with religion; this connection may lie in the remote regions where the distinction between the ego and objects or between objects themselves is neglected. According to one ethical view, whose deeper motivation will become clear to us presently,[1] this readiness for a universal love of mankind and the world represents the highest standpoint which man can reach. Even at this early stage of the discussion I should like to bring forward my two main objections to this view. A love that does not discriminate seems to me to forfeit a part of its own value, by doing an injustice to its object; and secondly, not all men are worthy of love.

1 [See below, p. 100 f.]

The love which founded the family continues to operate in civilization both in its original form, in which it does not renounce direct sexual satisfaction, and in its modified form as aim-inhibited affection. In each, it continues to carry on its function of binding together considerable numbers of people, and it does so in a more intensive fashion than can be effected through the interest of work in common. The careless way in which language uses the word 'love' has its genetic [*genetische*] justification. People give the name 'love' to the relation between a man and a woman whose genital needs have led them to found a family; but they also give the name 'love' to the positive feelings between parents and children, and between the brothers and sisters of a family, although *we* are obliged to describe this as 'aim-inhibited love' or 'affection'. Love with an inhibited aim was in fact originally fully [103] sensual love, and it is so still in man's unconscious. Both – fully sensual love and aim-inhibited love – extend outside the family and create new bonds with people who before were strangers. Genital love leads to the formation of new families, and aim-inhibited love to 'friendships' which become valuable from a cultural standpoint because they escape some of the limitations of genital love, as, for instance, its exclusiveness. But in the course of development the relation of love to civilization loses its unambiguity. On the one hand, love comes into opposition to the interests of civilization; on the other, civilization threatens love with substantial restrictions.

This rift between them seems unavoidable. The reason for it is not immediately recognizable. It expresses itself at first as a conflict between the family and the larger community to which the individual belongs. We have already perceived that one of the main endeavours of civilization is to bring people together into large unities. But the family will not give the individual up. The more closely the members of a family are attached to one another, the more often do they tend to cut themselves off from others, and the more difficult is it for them to enter into the wider circle of life. The mode of life in common which is phylogenetically the older, and which is the only one that exists in childhood, will not let itself be superseded by the cultural mode of life which has been acquired later. Detaching himself from his family becomes a task that faces every young person, and society often helps him in the solution of it by means of puberty and initiation rites. We get the impression that these are difficulties which are inherent in all psychical – and, indeed, at bottom, in all organic – development.

Furthermore, women soon come into opposition to civilization and

display their retarding and restraining influence – those very women who, in the beginning, laid the foundations of civilization by the claims of their love. Women represent the interests of the family and of sexual life [*Sexuallebens*]. The work of civilization has become increasingly the business of men, it confronts them with ever more difficult tasks and compels them to carry out drive sublimations of which women are little capable. Since a man does not have unlimited quantities of psychical energy at his disposal, he has to accomplish his tasks by making an expedient distribution of his libido. What he employs for cultural aims
[104] he to a great extent withdraws from women and sexual life. His constant association with men, and his dependence on his relations with them, even estrange him from his duties as a husband and father. Thus the woman finds herself forced into the background by the claims of civilization and she adopts a hostile attitude towards it.

The tendency on the part of civilization to restrict sexual life is no less clear than its other tendency to expand the cultural unit. Its first, totemic, phase already brings with it the prohibition against an incestuous choice of object, and this is perhaps the most drastic mutilation which man's erotic life has in all time experienced. Taboos, laws and customs impose further restrictions, which affect both men and women. Not all civilizations go equally far in this; and the economic structure of the society also influences the amount of sexual freedom that remains. Here, as we already know, civilization is obeying the laws of economic necessity, since a large amount of the psychical energy which it uses for its own purposes has to be withdrawn from sexuality. In this respect civilization behaves towards sexuality as a people or a stratum of its population does which has subjected another one to its exploitation. Fear of a revolt by the suppressed elements drives it to stricter precautionary measures. A high-water mark in such a development has been reached in our Western European civilization. A cultural community is perfectly justified, psychologically, in starting by proscribing manifestations of the sexual life of children, for there would be no prospect of curbing the sexual lusts of adults if the ground had not been prepared for it in childhood. But such a community cannot in any way be justified in going to the length of actually *disavowing* [*zu leugnen*] such easily demonstrable, and, indeed, striking phenomena. As regards the sexually mature individual, the choice of an object is restricted to the opposite sex, and most extra-genital satisfactions are forbidden as perversions. The requirement, demonstrated in these prohibitions, that there shall be a single kind of sexual life for everyone disregards the dissimilarities, whether

innate or acquired, in the sexual constitution of human beings; it cuts off a fair number of them from sexual enjoyment, and so becomes the source of serious injustice. The result of such restrictive measures might be that in people who are normal – who are not prevented by their constitution – the whole of their sexual interests would flow without loss into the channels that are left open. But heterosexual genital love, [105] which has remained exempt from outlawry, is itself restricted by further limitations, in the shape of insistence upon legitimacy and monogamy. Present-day civilization makes it plain that it will permit sexual relationships only on the basis of a solitary, indissoluble bond between one man and one woman, and that it does not like sexuality as a source of pleasure in its own right and is prepared to tolerate it only because there is so far no substitute for it as a means of propagating the human race.

This, of course, is an extreme picture. Everybody knows that it has proved impossible to put it into execution, even for quite short periods. Only the weaklings have submitted to such an extensive encroachment upon their sexual freedom, and stronger natures have only done so subject to a compensatory condition, which will be mentioned later.[1] Civilized society has found itself obliged to pass over in silence many transgressions which, according to its own rescripts, it ought to have punished. But we must not err on the other side and assume that, because it does not achieve all its aims, such an attitude on the part of society is entirely innocuous. The sexual life of civilized man is notwithstanding severely impaired; it sometimes gives the impression of being in process of involution as a function, just as our teeth and hair seem to be as organs. One is probably justified in assuming that its importance as a source of feelings of happiness, and therefore in the fulfilment of our aim in life, has sensibly diminished.[2] Sometimes one seems to perceive that it is not only the pressure of civilization but something in the nature of the function itself which denies us full satisfaction and urges us along other paths. This may be wrong; it is hard to decide.[3]

1 [The compensation is the obtaining of some measure of security. See below, p. 103.]

2 Among the works of that sensitive English writer, John Galsworthy, who enjoys general recognition today, there is a short story of which I early formed a high opinion. It is called 'The Apple-Tree', and it brings home to us how the life of present-day civilized people leaves no room for the simple natural love of two human beings.

3 The view expressed above is supported by the following considerations. Man is an animal organism with (like others) an unmistakably bisexual disposition. The individual corresponds to a fusion of two symmetrical halves, of which, according to some investigators, one is purely male and the other female. It is equally possible that each half was originally hermaphrodite. Sex [*Geschlechtlichkeit*] is a biological fact which, although it is of extraordinary importance in mental life, is hard to grasp psychologically. We are accustomed to say that every human being [106]

displays both male and female drive impulses, needs and attributes; but though anatomy, it is true, can point out the characteristic of maleness and femaleness, psychology cannot. For psychology the contrast between the sexes fades away into one between activity and passivity, in which we far too readily identify activity with maleness and passivity with femaleness, a view which is by no means universally confirmed in the animal kingdom. The theory of bisexuality is still surrounded by many obscurities and we cannot but feel it as a serious impediment in psychoanalysis that it has not yet found any link with the theory of the drives. However this may be, if we assume it as a fact that each individual seeks to satisfy both male and female wishes in his sexual life [*Sexualleben*], we are prepared for the possibility that those [two sets of] demands are not fulfilled by the same object, and that they interfere with each other unless they can be kept apart and each impulse guided into a particular channel that is suited to it. Another difficulty arises from the circumstance that there is so often associated with the erotic relationship, over and above its own sadistic components, a quota of plain inclination to aggression. The love object will not always view these complications with the degree of understanding and tolerance shown by the peasant woman who complained that her husband did not love her any more, since he had not beaten her for a week.

The conjecture which goes deepest, however, is the one which takes its start from what I have said above in my footnote on p. 91 f. It is to the effect that, with the assumption of an erect posture by man and with the depreciation of his sense of smell, it was not only his anal erotism which threatened to fall victim to organic repression, but the whole of his sexuality; so that since this, the sexual function has been accompanied by a repugnance which cannot further be accounted for, and which prevents its complete satisfaction and forces it away from the sexual aim into sublimations and libidinal displacements. I know that Bleuler (1913*a*) once pointed to the existence of a primary repelling attitude like this towards sexual life. All neurotics, and many others besides, take exception to the fact that '*inter urinas et faeces nascimur* [we are born between urine and faeces]'. The genitals, too, give rise to strong sensations of smell which many people cannot tolerate and which spoil sexual intercourse for them. Thus we should find that the deepest root of the sexual repression which advances along with civilization is the organic defence of the new form of life achieved with man's erect gait against his earlier animal existence. This result of scientific research coincides in a remarkable way with commonplace prejudices that have often made themselves heard. Nevertheless, these things are at present no more than unconfirmed possibilities which have not been substantiated by science. Nor should we forget that, in spite of the undeniable depreciation of olfactory stimuli, there exist even in Europe peoples among whom the strong genital odours which are so repellent to us are highly prized as sexual stimulants and who refuse to give them up. (Cf. the collections of folklore obtained from Iwan Bloch's questionnaire on the sense of smell in sexual life ['*Uber den Geruchssinn in der vita* [107] *sexualis*'] published in different volumes of Friedrich S. Krauss's *Anthropophyteia*.)

[On the difficulty of finding a psychological meaning for 'maleness' and 'femaleness', see a long footnote added in 1915 to the third of Freud's *Three Essays* (1905*d*), *RSE*, **7**, 194 *n.* 1, and a discussion at the beginning of Lecture XXXIII of the *New Introductory Lectures* (1933*a*), ibid., **22**, 100–3. – The important consequences of the proximity between the sexual and excretory organs were first indicated by Freud in the unpublished Draft K sent to Fliess on January 1, 1896 (Freud, 1950*a*). He returned to the point frequently. Cf., for instance, the 'Dora' case history (1905*e* [1901]), *RSE*, **7**, 29, and the second paper on 'The Psychology of Love' (1912*d*), ibid., **11**, 176. Cf. also the Editors' Introduction, p. 56 f. above.]

V

Psychoanalytic work has shown us that it is precisely these frustrations [108]
of sexual life which people known as neurotics cannot tolerate. The neurotic creates substitutive satisfactions for himself in his symptoms, and these either cause him suffering in themselves or become sources of suffering for him by raising difficulties in his relations with his environment and the society he belongs to. The latter fact is easy to understand; the former presents us with a new problem. But civilization demands other sacrifices besides that of sexual satisfaction.

We have treated the difficulty of cultural development as a general difficulty of development by tracing it to the inertia of the libido, to its disinclination to give up an old position for a new one.[1] We are saying much the same thing when we derive the antithesis between civilization and sexuality from the circumstance that sexual love is a relationship between two individuals in which a third can only be superfluous or disturbing, whereas civilization depends on relationships between a considerable number of individuals. When a love relationship is at its height there is no room left for any interest in the environment; a pair of lovers are sufficient to themselves, and do not even need the child they have in common to make them happy. In no other case does Eros so clearly betray the core of his being, his purpose of making one out of more than one; but when he has achieved this in the proverbial way through the love of two human beings, he refuses to go further.

So far, we can quite well imagine a cultural community consisting of double individuals like this, who, libidinally satisfied in themselves, are connected with one another through the bonds of common work and common interests. If this were so, civilization would not have to withdraw any energy from sexuality. But this desirable state of things does not, and never did, exist. Reality shows us that civilization is not content with the ties we have so far allowed it. It aims at binding the members of the community together in a libidinal way as well and employs every [109]
means to that end. It favours every path by which strong identifications can be established between the members of the community, and it summons up aim-inhibited libido on the largest scale so as to strengthen the communal bond by relations of friendship. In order for these aims to

1 [See, for instance, p. 93 f. above. For some remarks on Freud's use of the concept of 'psychical inertia' in general, see an Editors' footnote to Freud, 1915*f*; *RSE*, **14**, 269 *n.*]

be fulfilled, a restriction upon sexual life is unavoidable. But we are unable to understand what the necessity is which forces civilization along this path and which causes its antagonism to sexuality. There must be some disturbing factor which we have not yet discovered.

The clue may be supplied by one of the ideal demands, as we have called them,[1] of civilized society. It runs: 'Thou shalt love thy neighbour as thyself.' It is known throughout the world and is undoubtedly older than Christianity, which puts it forward as its proudest claim. Yet it is certainly not very old; even in historical times it was still strange to mankind. Let us adopt a naive attitude towards it, as though we were hearing it for the first time; we shall be unable then to suppress a feeling of surprise and bewilderment. Why should we do it? What good will it do us? But, above all, how shall we achieve it? How can it be possible? My love is something valuable to me which I ought not to throw away without reflection. It imposes duties on me for whose fulfilment I must be ready to make sacrifices. If I love someone, he must deserve it in some way. (I leave out of account the use he may be to me, and also his possible significance for me as a sexual object, for neither of these two kinds of relationship comes into question where the precept to love my neighbour is concerned.) He deserves it if he is so like me in important ways that I can love myself in him; and he deserves it if he is so much more perfect than myself that I can love my ideal of my own self in him. Again, I have to love him if he is my friend's son, since the pain my friend would feel if any harm came to him would be my pain too – I should have to share it. But if he is a stranger to me and if he cannot attract me by any worth of his own or any significance that he may already have acquired for my emotional life, it will be hard for me to love him. Indeed, I should be wrong to do so, for my love is valued by all my own people as a sign of my preferring them, and it is an injustice
[110] to them if I put a stranger on a par with them. But if I am to love him (with this universal love) merely because he, too, is an inhabitant of this earth, like an insect, an earthworm or a grass snake, then I fear that only a small modicum of my love will fall to his share – not by any possibility as much as, by the judgement of my reason, I am entitled to retain for myself. What is the point of a precept enunciated with so much solemnity if its fulfilment cannot be recommended as reasonable?

On closer inspection, I find still further difficulties. Not merely is this stranger in general unworthy of my love; I must honestly confess that he has more claim to my hostility and even my hatred. He seems not to

1 [See p. 86 above. Cf. also '"Civilized" Sexual Morality' (1908*d*), *RSE*, **9**, 173.]

have the least trace of love for me and shows me not the slightest consideration. If it will do him any good he has no hesitation in injuring me, nor does he ask himself whether the amount of advantage he gains bears any proportion to the extent of the harm he does to me. Indeed, he need not even obtain an advantage; if he can satisfy any sort of desire by it, he thinks nothing of jeering at me, insulting me, slandering me and showing his superior power; and the more secure he feels and the more helpless I am, the more certainly I can expect him to behave like this to me. If he behaves differently, if he shows me consideration and forbearance as a stranger, I am ready to treat him in the same way, in any case and quite apart from any precept. Indeed, if this grandiose commandment had run 'Love thy neighbour as thy neighbour loves thee', I should not take exception to it. And there is a second commandment, which seems to me even more incomprehensible and arouses still stronger opposition in me. It is 'Love thine enemies'. If I think it over, however, I see that I am wrong in treating it as a greater imposition. At bottom it is the same thing.[1]

I think I can now hear a dignified voice admonishing me: 'It is pre- [111]
cisely because your neighbour is not worthy of love, and is on the contrary your enemy, that you should love him as yourself.' I then understand that the case is one like that of *Credo quia absurdum*.[2]

Now it is very probable that my neighbour, when he is enjoined to love me as himself, will answer exactly as I have done and will repel me for the same reasons. I hope he will not have the same objective grounds for doing so, but he will have the same idea as I have. Even so, the behaviour of human beings shows differences, which ethics, disregarding the fact that such differences are determined, classifies as 'good' or 'bad'. So long as these undeniable differences have not been removed, obedience to high ethical demands entails damage to the aims of civilization, for it puts a positive premium on being bad. One is irresistibly reminded of an incident in the French Chamber when capital punishment was being debated. A member had been passionately supporting its abolition

1 A great imaginative writer may permit himself to give expression – jokingly, at all events – to psychological truths that are severely proscribed. Thus Heine confesses: 'Mine is a most peaceable disposition. My wishes are: a humble cottage with a thatched roof, but a good bed, good food, the freshest milk and butter, flowers before my window, and a few fine trees before my door; and if God wants to make my happiness complete, he will grant me the joy of seeing some six or seven of my enemies hanging from those trees. Before their death I shall, moved in my heart, forgive them all the wrong they did me in their lifetime. One must, it is true, forgive one's enemies – but not before they have been hanged.' (*Gedanken und Einfälle* [Section I].)

2 [See Chapter V of *The Future of an Illusion* (1927*c*), p. 26 above. Freud returns to the question of the commandment to love one's neighbour as oneself below, on p. 128 f.]

and his speech was being received with tumultuous applause, when a voice from the hall called out: 'Que messieurs les assassins commencent!'[1]

The element of truth behind all this, which people are so ready to disavow, is that men are not gentle creatures who want to be loved, and who at the most can defend themselves if they are attacked; they are, on the contrary, creatures among whose drive endowments is to be reckoned a powerful share of aggressiveness. As a result, their neighbour is for them not only a potential helper or sexual object, but also someone who tempts them to satisfy their aggressiveness on him, to exploit his capacity for work without compensation, to use him sexually without his consent, to seize his possessions, to humiliate him, to cause him pain, to torture and to kill him. *Homo homini lupus*.[2] Who, in the face of all his experience of life and of history, will have the courage to dispute this assertion? As a rule this cruel aggressiveness waits for some provocation or puts itself at the service of some other purpose, whose goal might also have been reached by milder measures. In circumstances
[112] that are favourable to it, when the mental counterforces which ordinarily inhibit it are out of action, it also manifests itself spontaneously and reveals man as a savage beast to whom consideration towards his own kind is something alien. Anyone who calls to mind the atrocities committed during the racial migrations or the invasions of the Huns, or by the people known as Mongols under Jenghiz Khan and Tamerlane, or at the capture of Jerusalem by the pious Crusaders, or even, indeed, the horrors of the recent World War – anyone who calls these things to mind will have to bow humbly before the truth of this view.

The existence of this inclination to aggression, which we can detect in ourselves and justly assume to be present in others, is the factor which disturbs our relations with our neighbour and which forces civilization into such a high expenditure [of energy]. In consequence of this primary mutual hostility of human beings, civilized society is perpetually threatened with disintegration. The interest of work in common would not hold it together; drive passions are stronger than reasonable interests. Civilization has to use its utmost efforts in order to set limits to man's aggressive drives and to hold the manifestations of them in check by psychical reaction-formations. Hence, therefore, the use of methods intended to incite people into identifications and aim-inhibited relationships of love, hence the restriction upon sexual life,

1 ['Let the murderers make the first move.' The editors of the *Oeuvres complètes de Freud* identify this phrase as being derived from Alphonse Karr's review, *Les Guêpes* (the January 1849 issue). Freud quoted the same phrase in a letter to Fliess dated April 6, 1897.]

2 ['Man is a wolf to man.' Derived from Plautus, *Asinaria* II, iv, 88.]

and hence too the ideal's commandment to love one's neighbour as oneself – a commandment which is really justified by the fact that nothing else runs so strongly counter to the original nature of man. In spite of every effort, these endeavours of civilization have not so far achieved very much. It hopes to prevent the crudest excesses of brutal violence by itself assuming the right to use violence against criminals, but the law is not able to lay hold of the more cautious and refined manifestations of human aggressiveness. The time comes when each one of us has to give up as illusions the expectations which, in his youth, he pinned upon his fellow men, and when he may learn how much difficulty and pain has been added to his life by their ill-will. At the same time, it would be unfair to reproach civilization with trying to eliminate strife and competition from human activity. These things are undoubtedly indispensable. But opposition is not necessarily enmity; it is merely misused and made an *occasion* for enmity.

The Communists believe that they have found the path to deliver- [113]
ance from our evils. According to them, man is wholly good and is well disposed to his neighbour; but the institution of private property has corrupted his nature. The ownership of private wealth gives the individual power, and with it the temptation to ill-treat his neighbour; while the man who is excluded from possession is bound to rebel in hostility against his oppressor. If private property were abolished, all wealth held in common, and everyone allowed to share in the enjoyment of it, ill-will and hostility would disappear among men. Since everyone's needs would be satisfied, no-one would have any reason to regard another as his enemy; all would willingly undertake the work that was necessary. I have no concern with any economic criticisms of the Communist system; I cannot enquire into whether the abolition of private property is expedient or advantageous.[1] But I am able to recognize that the psychological premises on which the system is based are an untenable illusion. In abolishing private property we deprive the human love of aggression of one of its instruments, certainly a strong one, though certainly not the strongest; but we have in no way altered the differences in power and influence which are misused by aggressiveness, nor have we altered anything in its nature. Aggressiveness was

1 Anyone who has tasted the miseries of poverty in his own youth and has experienced the indifference and arrogance of the well-to-do should be safe from the suspicion of having no understanding or good will towards endeavours to fight against the inequality of wealth among men and all that it leads to. To be sure, if an attempt is made to base this fight upon an abstract demand, in the name of justice, for equality for all men, there is a very obvious objection to be made – that nature, by endowing individuals with extremely unequal physical attributes and mental capacities, has introduced injustices against which there is no remedy.

not created by property. It reigned almost without limit in primitive times, when property was still very scanty, and it already shows itself in the nursery almost before property has given up its primal, anal form; it forms the basis of every relation of affection and love among people (with the single exception, perhaps, of the mother's relation to her male child[1]). If we do away with personal rights over material wealth, there still remains prerogative in the field of sexual relationships, which is bound to become the source of the strongest dislike and [114] the most violent hostility among men who in other respects are on an equal footing. If we were to remove this factor, too, by allowing complete freedom of sexual life and thus abolishing the family, the germ cell of civilization, we cannot, it is true, easily foresee what new paths the development of civilization could take; but one thing we can expect, and that is that this indestructible feature of human nature will follow it there.

It is clearly not easy for men to give up the satisfaction of this inclination to aggression. They do not feel comfortable without it. The advantage which a comparatively small cultural group [*Kulturkreises*] offers of allowing this drive an outlet in the form of hostility against intruders is not to be despised. It is always possible to bind together a considerable number of people in love, so long as there are other people left over to receive the manifestations of their aggressiveness. I once discussed the phenomenon that it is precisely communities with adjoining territories, and related to each other in other ways as well, who are engaged in constant feuds and in ridiculing each other – like the Spaniards and Portuguese, for instance, the North Germans and South Germans, the English and Scots, and so on.[2] I gave this phenomenon the name of 'the narcissism of minor differences', a name which does not do much to explain it. We can now see that it is a convenient and relatively harmless satisfaction of the inclination to aggression, by means of which cohesion between the members of the community is made easier. In this respect the Jewish people, scattered everywhere, have rendered most useful services to the civilizations of the countries that have been their hosts; but unfortunately all the massacres of the Jews in the Middle Ages did not suffice to make that period more peaceful and secure for their Christian fellows. When once the Apostle Paul had

1 [Cf. a footnote to Chapter VI of *Group Psychology* (1921*c*), *RSE*, **18**, 94 *n*. 2. A rather longer discussion of the point occurs in Lecture XXXIII of the *New Introductory Lectures* (1933*a*), ibid., **22**, 117–18.]

2 [See Chapter VI of *Group Psychology* (1921*c*), ibid., **18**, 94, and 'The Taboo of Virginity' (1918*a*), ibid., **11**, 188–9.]

posited universal love between men as the foundation of his Christian community, extreme intolerance on the part of Christendom towards those who remained outside it became the inevitable consequence. To the Romans, who had not founded their communal life as a State upon love, religious intolerance was something foreign, although with them religion was a concern of the State and the State was permeated by religion. Neither was it an unaccountable chance that the dream of a [115] Germanic world dominion called for anti-Semitism as its complement; and it is intelligible that the attempt to establish a new, Communist civilization in Russia should find its psychological support in the persecution of the bourgeois. One only wonders, with concern, what the Soviets will do after they have wiped out their bourgeois.

If civilization imposes such great sacrifices not only on man's sexuality but on his aggressivity, we can understand better why it is hard for him to be happy in that civilization. In fact, primitive man was better off in knowing no restrictions of drive. To counterbalance this, his prospects of enjoying this happiness for any length of time were very slender. Civilized man has exchanged a portion of his possibilities of happiness for a portion of security. We must not forget, however, that in the primal family only the head of it enjoyed this drive freedom; the rest lived in slavish suppression. In that primal period of civilization, the contrast between a minority who enjoyed the advantages of civilization and a majority who were robbed of those advantages was, therefore, carried to extremes. As regards the primitive peoples who exist today, careful researches have shown that their drive life is by no means to be envied for its freedom. It is subject to restrictions of a different kind but perhaps of greater severity than those attaching to modern civilized man.

When we justly find fault with the present state of our civilization for so inadequately fulfilling our demands for a plan of life that shall make us happy, and for allowing the existence of so much suffering which could probably be avoided – when, with unsparing criticism, we try to uncover the roots of its imperfection, we are undoubtedly exercising a proper right and are not showing ourselves enemies of civilization. We may expect gradually to carry through such alterations in our civilization as will better satisfy our needs and will escape our criticisms. But perhaps we may also familiarize ourselves with the idea that there are difficulties attaching to the nature of civilization which will not yield to any attempt at reform. Over and above the tasks of restricting the drives, which we are prepared for, there forces itself on our notice the danger of a state of things which might be termed 'the psychological poverty of

[116] groups'.[1] This danger is most threatening where the bonds of a society are chiefly constituted by the identification of its members with one another, while individuals of the leader type do not acquire the importance that should fall to them in the formation of a group.[2] The present cultural state of America would give us a good opportunity for studying the damage to civilization which is thus to be feared. But I shall avoid the temptation of entering upon a critique of American civilization; I do not wish to give an impression of wanting myself to employ American methods.

1 [The German '*psychologisches Elend*' seems to be a version of Janet's expression '*misère psychologique*' applied by him to describe the incapacity for mental synthesis which he attributes to neurotics.]

2 Cf. *Group Psychology and the Analysis of the Ego* (1921c) [*RSE*, **18**, 97 ff.].

VI

In none of my previous writings have I had so strong a feeling as now [117]
that what I am describing is common knowledge and that I am using up paper and ink and, in due course, the compositor's and printer's work and material in order to expound things which are, in fact, self-evident. For that reason I should be glad to seize the point if it were to appear that the recognition of a special, independent aggressive drive means an alteration of the psychoanalytic theory of the drives.

We shall see, however, that this is not so and that it is merely a matter of bringing into sharper focus a turn of thought arrived at long ago and of following its consequences. Of all the slowly developed parts of analytic theory, the theory of the drives is the one that has felt its way the most painfully forward.[1] And yet that theory was so indispensable to the whole structure that something had to be put in its place. In what was at first my utter perplexity, I took as my starting point a saying of the poet-philosopher Schiller that 'hunger and love are what moves the world'.[2] Hunger could be taken to represent the drives which aim at preserving the individual; while love strives for objects, and its chief function, favoured in every way by nature, is the preservation of the species. Thus, to begin with, ego drives and object drives confronted each other. It was to denote the energy of the latter and only the latter drives that I introduced the term 'libido'.[3] Thus the antithesis was between the ego drives and the 'libidinal' drives to love (in its widest sense[4]) which were directed to an object. One of these object drives, the sadistic drive, stood out from the rest, it is true, in that its aim was so very far from being loving. Moreover, it was obviously in some respects attached to the ego drives; it could not hide its close affinity with drives to mastery which have no libidinal purpose. But these discrepancies were got over; after all, sadism was clearly a part of sexual life, in the [118]
activities of which affection could be replaced by cruelty. Neurosis was regarded as the outcome of a struggle between the interest of self-preservation and the demands of the libido, a struggle in which the ego

1 [Some account of the history of Freud's theory of the drives can be found in the Editors' Note to his paper 'Drives and their Vicissitudes' (1915*c*), *RSE*, **14**, 100 ff.]

2 ['Die Weltweisen.']

3 [In Section II of the first paper on anxiety neurosis (1895*b*), ibid., **3**.]

4 [I.e. as used by Plato. See Chapter IV of *Group Psychology* (1921*c*), ibid., **18**, 85.]

had been victorious but at the price of severe sufferings and renunciations.

Every analyst will admit that even today this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object drives to the ego. The decisive step forward was the introduction of the concept of narcissism – that is to say, the discovery that the ego itself is cathected [*besetzt*][T] with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters.[1] This narcissistic libido turns towards objects, and thus becomes object libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses [*Übertragungsneurosen*][T] as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego drives, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with drive energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the drives could not all be of the same kind. My next step was taken in *Beyond the Pleasure Principle* (1920*g*), when the compulsion to repeat and the conservative character of the life of the drives first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the drive to preserve living substance and to join it into ever larger units,[2] there must exist another, contrary drive seeking to dissolve those units and to bring them back to their primaeval, inorganic state. That is to say, as well as Eros there was a death drive. The phenomena of life could be explained from the concurrent or mutually opposing action of these two drives. It was not easy, however, to demonstrate the activities of this supposed death drive. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death drive operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the drive is diverted towards the external world and comes

Übertragung

[119]

1 [Cf. in this connection the editorial Appendix B to *The Ego and the Id* (1923*b*), *RSE*, **19**, 56.]

2 The opposition which thus emerges between the ceaseless trend by Eros towards extension and the general conservative nature of the drives is striking, and it may become the starting point for the study of further problems.

to light as a drive to aggression and destruction. In this way the drive itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of drives seldom – perhaps never – appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component drive of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive drive; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality – a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

The assumption of the existence of a drive to death or destruction has met with resistance even in analytic circles; I am aware that there is a frequent inclination rather to ascribe whatever is dangerous and hostile in love to an original bipolarity in its own nature. To begin with it was only tentatively that I put forward the views I have developed here,[1] but in the course of time they have gained such a hold upon me that I can no longer think in any other way. To my mind, they are far more serviceable from a theoretical standpoint than any other possible ones; they provide that simplification, without either ignoring or doing violence to the facts, for which we strive in scientific work. I know that in sadism and masochism we have always seen before us manifestations of the destructive drive (directed outwards and inwards), strongly [120] alloyed with erotism; but I can no longer understand how we can have overlooked the ubiquity of non-erotic aggressivity and destructiveness and can have failed to give it its due place in our interpretation of life. (The desire for destruction when it is directed *inwards* mostly eludes our perception, of course, unless it is tinged with erotism.) I remember my own defensive attitude when the idea of a destructive drive first emerged in psychoanalytic literature, and how long it took before I became receptive to it.[2] That others should have shown, and still show, the same attitude of rejection surprises me less. For 'little children do

1 [Cf. *Beyond the Pleasure Principle* (1920*g*), *RSE*, **18**, 56.]

2 [See some comments on this in the Editors' Introduction, p. 57 f. above.]

not like it'[1] when there is talk of the inborn human inclination to 'badness', to aggressiveness and destructiveness, and so to cruelty as well. God has made them in the image of His own perfection; nobody wants to be reminded how hard it is to reconcile the undeniable existence of evil – despite the protestations of Christian Science – with His all-powerfulness or His all-goodness. The Devil would be the best way out as an excuse for God; in that way he would be playing the same part as an agent of economic discharge as the Jew does in the world of the Aryan ideal.[2] But even so, one can hold God responsible for the existence of the Devil just as well as for the existence of the wickedness which the Devil embodies. In view of these difficulties, each of us will be well advised, on some suitable occasion, to make a low bow to the deeply moral nature of mankind; it will help us to be generally popular and much will be forgiven us for it.[3]

[121] The name 'libido' can once more be used to denote the manifestations of the power of Eros in order to distinguish them from the energy of

1 ['Denn die Kindlein, Sie hören es nicht gerne.' A quotation from Goethe's poem 'Die Ballade vom vertriebenen und heimgekehrten Grafen'.]

2 [Cf. p. 102 f. above.]

3 In Goethe's Mephistopheles we have a quite exceptionally convincing identification of the principle of evil with the destructive drives:

> Denn alles, was entsteht,
> Ist wert, dass es zu Grunde geht . . .
> So ist dann alles, was Ihr Sünde,
> Zerstörung, kurz das Böse nennt,
> Mein eigentliches Element.
>
> [For all things, from the Void
> Called forth, deserve to be destroyed . . .
> Thus, all which you as Sin have rated –
> Destruction, – aught with Evil blent, –
> That is my proper element.]

The Devil himself names as his adversary, not what is holy and good, but Nature's power to create, to multiply life – that is, Eros:

> Der Luft, dem Wasser, wie der Erden
> Entwinden tausend Keime sich,
> Im Trocknen, Feuchten, Warmen, Kalten!
> Hätt' ich mir nicht die Flamme vorbehalten,
> Ich hätte nichts Aparts für mich.
>
> [From Water, Earth, and Air unfolding,
> A thousand germs break forth and grow,
> In dry, and wet, and warm, and chilly:
> And had I not the Flame reserved, why, really,
> There's nothing special of my own to show.

Both passages are from Goethe's *Faust*, Part I, Scene 3. Translated by Bayard Taylor. There is a passing allusion to the second passage in Chapter I (G) of *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 68–9.]

the death drive.[1] It must be confessed that we have much greater difficulty in grasping that drive; we can only suspect it, as it were, as something in the background behind Eros, and it escapes detection unless its presence is betrayed by its being alloyed with Eros. It is in sadism, where the death drive twists the erotic aim in its own sense and yet at the same time fully satisfies the erotic urge, that we succeed in obtaining the clearest insight into its nature and its relation to Eros. But even where it emerges without any sexual purpose, in the blindest fury of destructiveness, we cannot fail to recognize that the satisfaction of the drive is accompanied by an extraordinarily high degree of narcissistic enjoyment, owing to its presenting the ego with a fulfilment of the latter's old wishes for omnipotence. The drive to destruction, moderated and tamed, and, as it were, inhibited in its aim, must, when it is directed towards objects, provide the ego with the satisfaction of its vital needs and with control over nature. Since the assumption of the existence of the drive is mainly based on theoretical grounds, we must also [122]
admit that it is not entirely proof against theoretical objections. But this is how things appear to us now, in the present state of our knowledge; future research and reflection will no doubt bring further light which will decide the matter.

In all that follows I adopt the standpoint, therefore, that the inclination to aggression is an original, self-subsisting drive disposition in man, and I return to my view [p. 100 f. above] that it constitutes the greatest impediment to civilization. At one point in the course of this enquiry [p. 88] I was led to the idea that civilization was a special process which mankind undergoes, and I am still under the influence of that idea. I may now add that civilization is a process in the service of Eros, whose purpose is to combine single human individuals, and after that families, then races, peoples and nations, into one great unity, the unity of mankind. Why this has to happen, we do not know; the work of Eros is precisely this.[2] These collections of men are to be libidinally bound to one another. Necessity alone, the advantages of work in common, will not hold them together. But man's natural aggressive drive, the hostility of each against all and of all against each, opposes this programme of civilization. This aggressive drive is the derivative and the main representative of the death drive which we have found alongside of Eros and which shares world dominion with it. And now, I think, the meaning of

1 Our present point of view can be roughly expressed in the statement that libido has a share in every drive manifestation, but that not everything in that manifestation is libido.

2 [See *Beyond the Pleasure Principle* (1920*g*), *RSE*, **18**.]

the evolution of civilization is no longer obscure to us. It must present the struggle between Eros and Death, between the drive to life and the drive to destruction, as it works itself out in the human species. This struggle is what all life essentially consists of, and the evolution of civilization may therefore be simply described as the struggle for life of the human species.[1] And it is this battle of the giants that our nursemaids try to appease with their lullaby about Heaven.[2]

1 And we may probably add more precisely, a struggle for life in the shape it was bound to assume after a certain event which still remains to be discovered.

2 ['*Eiapopeia vom Himmel*.' A quotation from Heine's poem *Deutschland*, Caput I.]

VII

Why do our relatives, the animals, not exhibit any such cultural struggle? [123]
We do not know. Very probably some of them – the bees, the ants, the termites – strove for thousands of years before they arrived at the State institutions, the distribution of functions and the restrictions on the individual, for which we admire them today. It is a mark of our present condition that we know from our own feelings that we should not think ourselves happy in any of these animal States or in any of the roles assigned in them to the individual. In the case of other animal species it may be that a temporary balance has been reached between the influences of their environment and the mutually contending drives within them, and that thus a cessation of development has come about. It may be that in primitive man a fresh access to libido kindled a renewed burst of activity on the part of the destructive drive. There are a great many questions here to which as yet there is no answer.

Another question concerns us more immediately. What means does civilization employ in order to inhibit the aggressiveness which opposes it, to make it harmless, to get rid of it, perhaps? We have already become acquainted with a few of these methods, but not yet with the one that appears to be the most important. This we can study in the history of the development of the individual. What happens in him to render his desire for aggression innocuous? Something very remarkable, which we should never have guessed and which is nevertheless quite obvious. His aggressiveness is introjected, internalized; it is, in point of fact, sent back to where it came from – that is, it is directed towards his own ego. There it is taken over by a portion of the ego, which sets itself over against the rest of the ego as superego [*Über-Ich*][T], and which now, in the form of 'conscience', is ready to put into action against the ego the same harsh aggressiveness that the ego would have liked to satisfy upon other, extraneous individuals. The tension between the harsh superego and the ego that is subjected to it is called by us the sense of guilt; it expresses itself as a need for punishment.[1] Civilization, therefore, obtains mastery over the individual's dangerous desire for aggression by [124]
weakening and disarming it and by setting up an agency within him to watch over it, like a garrison in a conquered city.

As to the origin of the sense of guilt, the analyst has different views

1 [Cf. 'The Economic Problem of Masochism' (1924*c*), *RSE*, **19**, 157–9.]

from other psychologists; but even he does not find it easy to give an account of it. To begin with, if we ask how a person comes to have a sense of guilt, we arrive at an answer which cannot be disputed: a person feels guilty (devout people would say 'sinful') when he has done something which he knows to be 'bad'. But then we notice how little this answer tells us. Perhaps, after some hesitation, we shall add that even when a person has not actually *done* the bad thing but has only recognized in himself an *intention* to do it, he may regard himself as guilty; and the question then arises of why the intention is regarded as equal to the deed. Both cases, however, presuppose that one had already recognized that what is bad is reprehensible, is something that must not be carried out. How is this judgement arrived at? We may reject the existence of an original, as it were natural, capacity to distinguish good from bad. What is bad is often not at all what is injurious or dangerous to the ego; on the contrary, it may be something which is desirable and enjoyable to the ego. Here, therefore, there is an extraneous influence at work, and it is this that decides what is to be called good or bad. Since a person's own feelings would not have led him along this path, he must have had a motive for submitting to this extraneous influence. Such a motive is easily discovered in his helplessness and his dependence on other people, and it can best be designated as fear of loss of love. If he loses the love of another person upon whom he is dependent, he also ceases to be protected from a variety of dangers. Above all, he is exposed to the danger that this stronger person will show his superiority in the form of punishment. At the beginning, therefore, what is bad is whatever causes one to be threatened with loss of love. For fear of that loss, one must avoid it. This, too, is the reason why it makes little difference whether one has already done the bad thing or only intends to do it. In either case the danger sets in only if and when the authority discovers it, and in either case the authority would behave in the same way.

[125] This state of mind is called a 'bad conscience'; but actually it does not deserve this name, for at this stage the sense of guilt is clearly only a fear [*Angst*] of loss of love, 'social' anxiety. In small children it can never be anything else, but in many adults, too, it has changed only to the extent that the place of the father or the two parents is taken by the larger human community. Consequently, such people habitually allow themselves to do any bad thing which promises them enjoyment, so long as they are sure that the authority will not know anything about it or cannot blame them for it; they are afraid only of being found out.[1] Present-day society has to reckon in general with this state of mind.

1 This reminds one of Rousseau's famous mandarin. [The problem raised by Rousseau had been quoted in full in Freud's paper on 'Our Attitude towards Death' (1915*b*), *RSE*, **14**, 297.]

A great change takes place only when the authority is internalized through the establishment of a superego. The phenomena of conscience then reach a higher stage. Actually, it is not until now that we should speak of conscience or a sense of guilt.[1] At this point, too, the fear of being found out comes to an end; the distinction, moreover, between doing something bad and wishing to do it disappears entirely, since nothing can be hidden from the superego, not even thoughts. It is true that the seriousness of the situation from a real point of view has passed away, for the new authority, the superego, has no motive that we know of for ill-treating the ego, with which it is intimately bound up; but genetic influence [*Einfluss der Genese*], which leads to the survival of what is past and has been surmounted, makes itself felt in the fact that fundamentally things remain as they were at the beginning. The superego torments the sinful ego with the same feeling of anxiety and is on the watch for opportunities of getting it punished by the external world.

At this second stage of development, the conscience exhibits a peculiarity which was absent from the first stage and which is no longer easy to account for.[2] For the more virtuous a man is, the more severe and [126]
distrustful is its behaviour, so that ultimately it is precisely those people who have carried saintliness[3] furthest who reproach themselves with the worst sinfulness. This means that virtue forfeits some part of its promised reward; the docile and continent ego does not enjoy the trust of its mentor, and strives in vain, it would seem, to acquire it. The objection will at once be made that these difficulties are artificial ones, and it will be said that a stricter and more vigilant conscience is precisely the hallmark of a moral man. Moreover, when saints call themselves sinners, they are not so wrong, considering the temptations to drive satisfaction to which they are exposed in a specially high degree – since, as is well known, temptations are merely increased by constant frustration [*Versagung*], whereas an occasional satisfaction of them causes them to diminish, at least for the time being. The field of ethics, which is so full of problems, presents us with another fact: namely that ill-luck – that is, external frustration – so greatly enhances the power of the

1 Everyone of discernment will understand and take into account the fact that in this summary description we have sharply delimited events which in reality occur by gradual transitions, and that it is not merely a question of the *existence* of a superego but of its relative strength and sphere of influence. All that has been said above about conscience and guilt is, moreover, common knowledge and almost undisputed.

2 [This paradox had been discussed by Freud earlier. See, for instance, Chapter V of *The Ego and the Id* (1923*b*), *RSE*, **19**, 48, where other references are given.]

3 ['*Heiligkeit*.' The same term, used in the different sense of 'holiness', is discussed by Freud in some other passages. Cf. the paper on 'civilized' sexual morality (1908*d*), ibid., **9**, 163–4.]

conscience in the superego. As long as things go well with a man, his conscience is lenient and lets the ego do all sorts of things; but when misfortune befalls him, he searches his soul, acknowledges his sinfulness, heightens the demands of his conscience, imposes abstinences on himself and punishes himself with penances.[1] Whole peoples have behaved in this way, and still do. This, however, is easily explained by the original infantile stage of conscience, which, as we see, is not given up after the introjection into the superego, but persists alongside of it and behind it. Fate is regarded as a substitute for the parental agency. If a man is unfortunate it means that he is no longer loved by this highest power; and, threatened by such a loss of love, he once more bows to
[127] the parental representative in his superego – a representative whom, in his days of good fortune, he was ready to neglect. This becomes especially clear where Fate is looked upon in the strictly religious sense of being nothing else than an expression of the Divine Will. The people of Israel had believed themselves to be the favourite child of God, and when the great Father caused misfortune after misfortune to rain down upon this people of his, they were never shaken in their belief in his relationship to them or questioned his power or righteousness. Instead, they produced the prophets, who held up their sinfulness before them; and out of their sense of guilt they created the over-strict commandments of their priestly religion.[2] It is remarkable how differently a primitive man behaves. If he has met with a misfortune, he does not throw the blame on himself but on his fetish, which has obviously not done its duty, and he gives it a thrashing instead of punishing himself.

Thus we know of two origins of the sense of guilt: one arising from fear [*Angst*] of an authority, and the other, later on, arising from fear of the superego. The first insists upon a renunciation of drive satisfactions; the second, as well as doing this, presses for punishment, since the continuance of the forbidden wishes cannot be concealed from the superego. We have also learnt how the severity of the superego – the demands of conscience – is to be understood. It is simply a continuation of the severity of the external authority, to which it has succeeded and

1 This enhancing of morality as a consequence of ill-luck has been illustrated by Mark Twain in a delightful little story, *The First Melon I Ever Stole*. This first melon happened to be unripe. I heard Mark Twain tell the story himself in one of his public readings. After he had given out the title, he stopped and asked himself as though he was in doubt: '*Was* it the first?' With this, everything had been said. The first melon was evidently not the only one. [This last sentence was added in 1931. – In a letter to Fliess of February 9, 1898, Freud reported that he had attended a reading by Mark Twain a few days earlier. (Freud, 1950*a*, Letter 83.)]

2 [A very much more extended account of the relations of the people of Israel to their God is to be found in Freud's *Moses and Monotheism* (1939*a*), *RSE*, **23**, 47 ff.]

which it has in part replaced. We now see in what relationship the renunciation of drive stands to the sense of guilt. Originally, renunciation of drive was the result of fear of an external authority: one renounced one's satisfactions in order not to lose its love. If one has carried out this renunciation, one is, as it were, quits with the authority and no sense of guilt should remain. But with fear of the superego the case is different. Here, drive renunciation is not enough, for the wish persists and cannot be concealed from the superego. Thus, in spite of the renunciation that has been made, a sense of guilt comes about. This constitutes a great economic disadvantage in the erection of a superego, or, as we may put it, in the formation of a conscience. Drive renunciation now no longer has a completely liberating effect; virtuous continence is no longer rewarded with the assurance of love. A threatened external unhappiness – loss of love and punishment on the part of the external authority – has been exchanged for a permanent internal unhappiness, for the tension of the sense of guilt. [128]

These interrelations are so complicated and at the same time so important that, at the risk of repeating myself, I shall approach them from yet another angle. The chronological sequence, then, would be as follows. First comes renunciation of drive owing to fear of aggression by the *external* authority. (This is, of course, what fear of the loss of love amounts to, for love is a protection against this punitive aggression.) After that comes the erection of an *internal* authority, and renunciation of drive owing to fear of it – owing to fear of conscience.[1] In this second situation bad intentions are equated with bad actions, and hence come a sense of guilt and a need for punishment. The aggressiveness of conscience keeps up the aggressiveness of the authority. So far things have no doubt been made clear; but where does this leave room for the reinforcing influence of misfortune (of renunciation imposed from without) [p. 113 f. above], and for the extraordinary severity of conscience in the best and most tractable people [p. 113]? We have already explained both these peculiarities of conscience, but we probably still have an impression that those explanations do not go to the bottom of the matter, and leave a residue still unexplained. And here at last an idea comes in which belongs entirely to psychoanalysis and which is foreign to people's ordinary way of thinking. This idea is of a sort which enables us to understand why the subject matter was bound to seem so confused and obscure to us. For it tells us that conscience (or more correctly, the

1 ['*Gewissensangst*.' Some remarks on this term can be found in an Editors' footnote to Chapter VII of *Inhibitions, Symptoms and Anxiety* (1926*d*), *RSE*, **20**, 114 *n.* 1.]

anxiety which later becomes conscience) is indeed the cause of drive renunciation to begin with, but that later the relationship is reversed. Every renunciation of drive now becomes a dynamic source of conscience and every fresh renunciation increases the latter's severity and intolerance. If we could only bring it better into harmony with what we already know about the history of the origin of conscience, we should
[129] be tempted to defend the paradoxical statement that conscience is the result of drive renunciation, or that drive renunciation (imposed on us from without) creates conscience, which then demands further drive renunciation.

The contradiction between this statement and what we have previously said about the genesis of conscience is in point of fact not so very great, and we see a way of further reducing it. In order to make our exposition easier, let us take as our example the aggressive drive, and let us assume that the renunciation in question is always a renunciation of aggression. (This, of course, is only to be taken as a temporary assumption.) The effect of drive renunciation on the conscience then is that every piece of aggression whose satisfaction the subject gives up is taken over by the superego and increases the latter's aggressiveness (against the ego). This does not harmonize well with the view that the original aggressiveness of conscience is a continuance of the severity of the external authority and therefore has nothing to do with renunciation. But the discrepancy is removed if we postulate a different derivation for this first instalment of the superego's aggressivity. A considerable amount of aggressiveness must be developed in the child against the authority which prevents him from having his first, but nonetheless his most important, satisfactions, whatever the kind of drive deprivation that is demanded of him may be; but he is obliged to renounce the satisfaction of this revengeful aggressiveness. He finds his way out of this economically difficult situation with the help of familiar mechanisms. By means of identification he takes the unattackable authority into himself. The authority now turns into his superego and enters into possession of all the aggressiveness which a child would have liked to exercise against it. The child's ego has to content itself with the unhappy role of the authority – the father – who has been thus degraded. Here, as so often, the [real] situation is reversed: 'If I were the father and you were the child, I should treat you badly.' The relationship between the superego and the ego is a return, distorted by a wish, of the real relationships between the ego, as yet undivided, and an external object. That is typical, too. But the essential difference is

that the original severity of the superego does not – or does not so much – represent the severity which one has experienced from it [the object], or which one attributes to it; it represents rather one's own [130] aggressiveness towards it. If this is correct, we may assert truly that in the beginning conscience arises through the suppression of an aggressive impulse, and that it is subsequently reinforced by fresh suppressions of the same kind.

Which of these two views is correct? The earlier one, which genetically seemed so unassailable, or the newer one, which rounds off the theory in such a welcome fashion? Clearly, and by the evidence, too, of direct observations, both are justified. They do not contradict each other, and they even coincide at one point, for the child's revengeful aggressiveness will be in part determined by the amount of punitive aggression which he expects from his father. Experience shows, however, that the severity of the superego which a child develops in no way corresponds to the severity of treatment which he has himself met with.[1] The severity of the former seems to be independent of that of the latter. A child who has been very leniently brought up can acquire a very strict conscience. But it would also be wrong to exaggerate this independence; it is not difficult to convince oneself that severity of upbringing does also exert a strong influence on the formation of the child's superego. What it amounts to is that in the formation of the superego and the emergence of a conscience innate constitutional factors and influences from the real environment act in combination. This is not at all surprising; on the contrary, it is a universal aetiological condition for all such processes.[2]

It can also be asserted that when a child reacts to his first great drive [131] frustrations with excessively strong aggressiveness and with a correspondingly severe superego, he is following a phylogenetic model and is going beyond the response that would be currently justified; for the father of prehistoric times was undoubtedly terrible, and an extreme

1 As has rightly been emphasized by Melanie Klein and by other English writers.

2 The two main types of pathogenic methods of upbringing – over-strictness and spoiling – have been accurately assessed by Franz Alexander in his book *The Psychoanalysis of the Total Personality* (1927) in connection with Aichhorn's study of delinquency [*Wayward Youth*, 1925]. The 'unduly lenient and indulgent father' is the cause of children's forming an over-severe superego, because, under the impression of the love that they receive, they have no other outlet for their aggressiveness but turning it inwards. In delinquent children, who have been brought up without love, the tension between ego and superego is lacking, and the whole of their aggressiveness can be directed outwards. Apart from a constitutional factor which may be supposed to be present, it can be said, therefore, that a severe conscience arises from the joint operation of two factors: the frustration of drive, which unleashes aggressiveness, and the experience of being loved, which turns the aggressiveness inwards and hands it over to the superego.

amount of aggressiveness may be attributed to him. Thus, if one shifts over from individual to phylogenetic development, the differences between the two theories of the genesis of conscience are still further diminished. On the other hand, a new and important difference makes its appearance between these two developmental processes. We cannot get away from the assumption that man's sense of guilt springs from the Oedipus complex and was acquired at the killing of the father by the brothers banded together.[1] On that occasion an act of aggression was not suppressed but carried out; but it was the same act of aggression whose suppression in the child is supposed to be the source of his sense of guilt. At this point I should not be surprised if the reader were to exclaim angrily: 'So it makes no difference whether one kills one's father or not – one gets a feeling of guilt in either case! We may take leave to raise a few doubts here. Either it is not true that the sense of guilt comes from suppressed aggressiveness, or else the whole story of the killing of the father is a fiction and the children of primaeval man did not kill their fathers any more often than children do nowadays. Besides, if it is not fiction but a plausible piece of history, it would be a case of something happening which everyone expects to happen – namely, of a person feeling guilty because he really has done something which cannot be justified. And of this event, which is after all an everyday occurrence, psychoanalysis has not yet given any explanation.'

That is true, and we must make good the omission. Nor is there any great secret about the matter. When one has a sense of guilt after having committed a misdeed, and because of it, the feeling should more properly be called *remorse*. It relates only to a deed that has been done, and, of course, it presupposes that a *conscience* – the readiness to feel guilty – was already in existence before the deed took place. Remorse of this sort can, therefore, never help us to discover the origin of conscience and of the sense of guilt in general. What happens in these
[132] everyday cases is usually this: a drive need acquires the strength to achieve satisfaction in spite of the conscience, which is, after all, limited in its strength; and with the natural weakening of the need owing to its having been satisfied, the former balance of power is restored. Psychoanalysis is thus justified in excluding from the present discussion the case of a sense of guilt due to remorse, however frequently such cases occur and however great their practical importance.

But if the human sense of guilt goes back to the killing of the primal father, that was after all a case of 'remorse'. Are we to assume that [at

1 [*Totem and Taboo* (1912–13*a*), *RSE*, **13**, 132.]

that time] a conscience and a sense of guilt were not, as we have presupposed, in existence before the deed? If not, where, in this case, did the remorse come from? There is no doubt that this case should explain the secret of the sense of guilt to us and put an end to our difficulties. And I believe it does. This remorse was the result of the primordial ambivalence of feeling towards the father. His sons hated him, but they loved him, too. After their hatred had been satisfied by their act of aggression, their love came to the fore in their remorse for the deed. It set up the superego by identification with the father; it gave that agency the father's power, as though as a punishment for the deed of aggression they had carried out against him, and it created the restrictions which were intended to prevent a repetition of the deed. And since the inclination to aggressiveness against the father was repeated in the following generations, the sense of guilt, too, persisted, and it was reinforced once more by every piece of aggressiveness that was suppressed and carried over to the superego. Now, I think, we can at last grasp two things perfectly clearly: the part played by love in the origin of conscience and the fatal inevitability of the sense of guilt. Whether one has killed one's father or has abstained from doing so is not really the decisive thing. One is bound to feel guilty in either case, for the sense of guilt is an expression of the conflict due to ambivalence, of the eternal struggle between Eros and the drive to destruction or death. This conflict is set going as soon as men are faced with the task of living together. So long as the community assumes no other form than that of the family, the conflict is bound to express itself in the Oedipus complex, to establish the conscience and to create the first sense of guilt. When an attempt is made to widen the community, the same conflict is continued in forms which are dependent on the past; and it [133] is strengthened and results in a further intensification of the sense of guilt. Since civilization obeys an internal erotic impulsion which causes human beings to unite in a closely knit group, it can only achieve this aim through an ever-increasing reinforcement of the sense of guilt. What began in relation to the father is completed in relation to the group. If civilization is a necessary course of development from the family to humanity as a whole, then – as a result of the inborn conflict arising from ambivalence, of the eternal struggle between the trends of love and death – there is inextricably bound up with it an increase of the sense of guilt, which will perhaps reach heights that the individual finds hard to tolerate. One is reminded of the great poet's moving arraignment of the 'Heavenly Powers':

Ihr führt ins Leben uns hinein.
Ihr lasst den Armen schuldig werden,
Dann überlasst Ihr ihn der Pein,
Denn jede Schuld rächt sich auf Erden.[I]

And we may well heave a sigh [*aufseufzen*][t] at the thought that it is nevertheless vouchsafed to a few to salvage without effort from the whirlpool of their own feelings the deepest truths, towards which the rest of us have to find our way through tormenting uncertainty and with restless groping.

1 One of the Harp-player's songs in Goethe's *Wilhelm Meister*.
[To earth, this weary earth, ye bring us
To guilt ye let us heedless go,
Then leave repentance fierce to wring us:
A moment's guilt, an age of woe!
Carlyle's translation.
The first couplet appears as an association to a dream in Freud's short book *On Dreams* (1901*a*), *RSE*, **5**, 577 and 579.]

VIII

Having reached the end of his journey, the author must ask his readers' [134]
forgiveness for not having been a more skilful guide and for not having spared them empty stretches of road and troublesome detours. There is no doubt that it could have been done better. I will attempt, late in the day [*nachträglich*], to make some amends.

In the first place, I suspect that the reader has the impression that our discussions on the sense of guilt disrupt the framework of this essay: that they take up too much space, so that the rest of its subject matter, with which they are not always closely connected, is pushed to one side. This may have spoilt the structure of my paper; but it corresponds faithfully to my intention to represent the sense of guilt as the most important problem in the development of civilization and to show that the price we pay for our advance in civilization is a loss of happiness through the heightening of the sense of guilt.[1] Anything that still sounds strange about this statement, which is the final conclusion of our investigation, can probably be traced to the quite peculiar relationship – as yet completely unexplained – which the sense of guilt has to our consciousness. In the common case of remorse, which we regard as normal, this feeling makes itself clearly enough perceptible to consciousness. Indeed, we are accustomed to speak of a 'consciousness of guilt' instead of a 'sense of [135]
guilt.'[2] Our study of the neuroses, to which, after all, we owe the most valuable pointers to an understanding of normal conditions, brings us up against some contradictions. In one of those affections, obsessional neurosis, the sense of guilt makes itself noisily heard in consciousness;

1 'Thus conscience does make cowards of us all . . .'

That the education of young people at the present day conceals from them the part which sexuality will play in their lives is not the only reproach which we are obliged to make against it. Its other sin is that it does not prepare them for the aggressiveness of which they are destined to become the objects. In sending the young out into life with such a false psychological orientation, education is behaving as though one were to equip people starting on a Polar expedition with summer clothing and maps of the Italian Lakes. In this it becomes evident that a certain misuse is being made of ethical demands. The strictness of those demands would not do so much harm if education were to say: 'This is how men ought to be, in order to be happy and to make others happy; but you have to reckon on their not being like that.' Instead of this the young are made to believe that everyone else fulfils those ethical demands – that is, that everyone else is virtuous. It is on this that the demand is based that the young, too, shall become virtuous.

2 ['*Schuldbewusstsein*' instead of '*Schuldgefühl*'. The second of these terms is the one which Freud has been using for the most part. They are synonyms apart from their literal meaning, and both are translated by the usual English 'sense of guilt' except on such special occasions as this.]

it dominates the clinical picture and the patient's life as well, and it hardly allows anything else to appear alongside of it. But in most other cases and forms of neurosis it remains completely unconscious, without on that account producing any less important effects. Our patients do not believe us when we attribute an 'unconscious sense of guilt' to them. In order to make ourselves at all intelligible to them, we tell them of an unconscious need for punishment, in which the sense of guilt finds expression. But its connection with a particular form of neurosis must not be overestimated. Even in obsessional neurosis there are types of patients who are not aware of their sense of guilt, or who only feel it as a tormenting uneasiness [*Unbehagen*],[1] a kind of anxiety, if they are prevented from carrying out certain actions. It ought to be possible eventually to understand these things; but as yet we cannot. Here perhaps we may be glad to have it pointed out that the sense of guilt is at bottom nothing else but a topographical variety of anxiety; in its later phases it coincides completely with *fear of the superego*. And the relations of anxiety to consciousness exhibit the same extraordinary variations. Anxiety is always present somewhere or other behind every symptom; but at one time it takes noisy possession of the whole of consciousness, while at another it conceals itself so completely that we are obliged to speak of unconscious anxiety or, if we want to have a clearer psychological conscience, since anxiety is in the first instance simply a feeling,[2] of possibilities of anxiety. Consequently it is very conceivable that the sense of guilt produced by civilization is not perceived as such either, and remains to a large extent unconscious, or appears as a sort of
[136] malaise [*Unbehagen*], a dissatisfaction [*Unzufriedenheit*], for which people seek other motivations. Religions, at any rate, have never overlooked the part played in civilization by a sense of guilt. Furthermore – a point which I failed to appreciate elsewhere[3] – they claim to redeem mankind from this sense of guilt, which they call sin. From the manner in which, in Christianity, this redemption is achieved – by the sacrificial death of a single person, who in this manner takes upon Himself a guilt that is common to everyone – we have been able to infer what the first occasion may have been on which this primal guilt, which was also the beginning of civilization, was acquired.[4]

1 ['*Unbehagen*': the word which appears in the title of this work. See *RSE*, **24**, 129–31, for a detailed discussion of its translation.]

2 [See Chapter VIII of *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 117. – Feelings cannot properly be described as 'unconscious' (cf. *The Ego and the Id* (1923*b*), ibid., **19**, 19).]

3 In *The Future of an Illusion* (1927*c*) [p. 5 ff. above].

4 *Totem and Taboo* (1912–13*a*) [*RSE*, **13**, 140–2].

Though it cannot be of great importance, it may not be superfluous to elucidate the meaning of a few words such as 'superego', 'conscience', 'sense of guilt', 'need for punishment' and 'remorse', which we have often, perhaps, used too loosely and interchangeably. They all relate to the same state of affairs, but denote different aspects of it. The superego is an agency which has been inferred by us, and conscience is a function which we ascribe, among other functions, to that agency. This function consists in keeping a watch over the actions and intentions of the ego and judging them, in exercising a censorship. The sense of guilt, the harshness of the superego, is thus the same thing as the severity of the conscience. It is the perception which the ego has of being watched over in this way, the assessment of the tension between its own strivings and the demands of the superego. The fear of this critical agency (a fear which is at the bottom of the whole relationship), the need for punishment, is a drive manifestation on the part of the ego, which has become masochistic under the influence of a sadistic superego; it is a portion, that is to say, of the drive towards internal destruction present in the ego, employed for forming an erotic attachment to the superego. We ought not to speak of a conscience until a superego is demonstrably present. As to a sense of guilt, we must admit that it is in existence before the superego, and therefore before conscience, too. At that time it is the immediate expression of fear of the external authority, a recognition of the tension between the ego and that authority. It is the direct derivative of the conflict between the need for the authority's love and the urge towards drive satisfaction, whose inhibition produces the inclination to [137]
aggression. The superimposition of these two strata of the sense of guilt – one coming from fear of the *external* authority, the other from fear of the *internal* authority – has hampered our insight into the position of conscience in a number of ways. Remorse is a general term for the ego's reaction in a case of sense of guilt. It contains, in little altered form, the sensory material of the anxiety which is operating behind the sense of guilt; it is itself a punishment and can include the need for punishment. Thus remorse, too, can be older than conscience.

Nor will it do any harm if we once more review the contradictions which have for a while perplexed us during our enquiry. Thus, at one point the sense of guilt was the consequence of acts of aggression that had been abstained from; but at another point – and precisely at its historical beginning, the killing of the father – it was the consequence of an act of aggression that had been carried out [p. 118 above]. But a way out of this difficulty was found. For the institution of the internal

authority, the superego, altered the situation radically. Before this, the sense of guilt coincided with remorse. (We may remark, incidentally, that the term 'remorse' should be reserved for the reaction after an act of aggression has actually been carried out.) After this, owing to the omniscience of the superego, the difference between an aggression intended and an aggression carried out lost its force. Henceforward a sense of guilt could be produced not only by an act of violence that is actually carried out (as all the world knows), but also by one that is merely intended (as psychoanalysis has discovered). Irrespectively of this alteration in the psychological situation, the conflict arising from ambivalence – the conflict between the two primal drives – leaves the same result behind [p. 119 above]. We are tempted to look here for the solution to the problem of the varying relation in which the sense of guilt stands to consciousness. It might be thought that a sense of guilt arising from remorse for an evil *deed* must always be conscious, whereas a sense of guilt arising from the perception of an evil *impulse* may remain unconscious. But the answer is not so simple as that. Obsessional neurosis speaks energetically against it.

The second contradiction concerned the aggressive energy with which we suppose the superego to be endowed. According to one view [*Auffassung*],
[138] that energy merely carries on the punitive energy of the external authority and keeps it alive in the mind [p. 112 above]; while, according to another view, it consists, on the contrary, of one's own aggressive energy which has not been used and which one now directs against that inhibiting authority [p. 116]. The first view seemed to fit in better with the *history*, and the second with the *theory*, of the sense of guilt. Closer reflection has resolved this apparently irreconcilable contradiction almost too completely; what remained as the essential and common factor was that in each case we were dealing with an aggressiveness which had been displaced [*verschobene*] inwards. Clinical observation, moreover, allows us in fact to distinguish two sources for the aggressiveness which we attribute to the superego; one or the other of them exercises the stronger effect in any given case, but as a general rule they operate in unison.

This is, I think, the place at which to put forward for serious consideration a view which I have earlier recommended for provisional acceptance.[1] In the most recent analytic literature a predilection is shown for the idea that any kind of frustration, any thwarted drive satisfaction, results, or may result, in a heightening of the sense of guilt.[2]

1 [Cf. the 'temporary assumption' on p. 116 above.]

2 This view is taken in particular by Ernest Jones, Susan Isaacs and Melanie Klein; and also, I understand, by Reik and Alexander.

A great theoretical simplification will, I think, be achieved if we regard this as applying only to the *aggressive* drives, and little will be found to contradict this assumption. For how are we to account, on dynamic and economic grounds, for an increase in the sense of guilt appearing in place of an unfulfilled *erotic* demand? This only seems possible in a roundabout way – if we suppose, that is, that the prevention of an erotic satisfaction calls up a piece of aggressiveness against the person who has interfered with the satisfaction, and that this aggressiveness has itself to be suppressed in turn. But if this is so, it is after all only the aggressiveness which is transformed into a sense of guilt, by being suppressed and made over to the superego. I am convinced that many processes will admit of a simpler and clearer exposition if the findings of psychoanalysis with regard to the derivation of the sense of guilt are restricted to the aggressive drives. Examination of the clinical material gives us no unequivocal answer here, because, as our hypothesis tells us, the two classes of drives hardly ever appear in a pure form, isolated from each [139]
other; but an investigation of extreme cases would probably point in the direction I anticipate.

I am tempted to extract a first advantage from this more restricted view of the case by applying it to the process of repression. As we have learnt, neurotic symptoms are, in their essence, substitutive satisfactions for unfulfilled sexual wishes. In the course of our analytic work we have discovered to our surprise that perhaps every neurosis conceals a quota of unconscious sense of guilt, which in its turn fortifies the symptoms by making use of them as a punishment. It now seems plausible to formulate the following proposition. When a drive trend undergoes repression, its libidinal elements are turned into symptoms, and its aggressive components into a sense of guilt. Even if this proposition is only an average approximation to the truth, it is worthy of our interest.

Some readers of this work may further have an impression that they have heard the formula of the struggle between Eros and the death drive too often. It was alleged to characterize the process of civilization which mankind undergoes [p. 109 f. above] but it was also brought into connection with the development of the individual [p. 106 f.], and, in addition, it was said to have revealed the secret of organic life in general [p. 106 f.]. We cannot, I think, avoid going into the relations of these three processes to one another. The repetition of the same formula is justified by the consideration that both the process of human civilization

and of the development of the individual are also vital processes – which is to say that they must share in the most general characteristic of life. On the other hand, evidence of the presence of this general characteristic fails, for the very reason of its general nature, to help us to arrive at any differentiation [between the processes], so long as it is not narrowed down by special qualifications. We can only be satisfied, therefore, if we assert that the process of civilization is a modification which the vital process experiences under the influence of a task that is set it by Eros and instigated by Ananke – by the exigencies of reality; and that this task is one of uniting separate individuals into a community bound together by libidinal ties. When, however, we look at the relation between the process of human civilization and the developmental or educative process of individual human beings, we shall conclude without much hesitation [140] that the two are very similar in nature, if not the very same process applied to different kinds of object. The process of the civilization of the human species is, of course, an abstraction of a higher order than is the development of the individual and it is therefore harder to apprehend in concrete terms, nor should we pursue analogies to an obsessional extreme; but in view of the similarity between the aims of the two processes – in the one case the integration of a separate individual into a human group, and in the other case the creation of a unified group out of many individuals – we cannot be surprised at the similarity between the means employed and the resultant phenomena.

In view of its exceptional importance, we must not long postpone the mention of one feature which distinguishes between the two processes. In the developmental process of the individual, the programme of the pleasure principle, which consists in finding the satisfaction of happiness, is retained as the main aim. Integration in, or adaptation to, a human community appears as a scarcely avoidable condition which must be fulfilled before this aim of happiness can be achieved. If it could be done without that condition, it would perhaps be preferable. To put it in other words, the development of the individual seems to us to be a product of the interaction between two urges, the urge towards happiness, which we usually call 'egoistic', and the urge towards union with others in the community, which we call 'altruistic'. Neither of these descriptions goes much below the surface. In the process of individual development, as we have said, the main accent falls mostly on the egoistic urge (or the urge towards happiness); while the other urge, which may be described as a 'cultural' one, is usually content with the role of imposing restrictions. But in the process of civilization things are

different. Here by far the most important thing is the aim of creating a unity out of the individual human beings. It is true that the aim of happiness is still there, but it is pushed into the background. It almost seems as if the creation of a great human community would be most successful if no attention had to be paid to the happiness of the individual. The developmental process of the individual can thus be expected to have special features of its own which are not reproduced in the process of human civilization. It is only insofar as the first of these processes has union with the community as its aim that it need coincide with the [141] second process.

Just as a planet revolves around a central body as well as rotating on its own axis, so the human individual takes part in the course of development of mankind at the same time as he pursues his own path in life. But to our dull eyes the play of forces in the heavens seems fixed in a never-changing order; in the field of organic life we can still see how the forces contend with one another, and how the effects of the conflict are continually changing. So, also, the two urges, the one towards personal happiness and the other towards union with other human beings, must struggle with each other in every individual; and so, also, the two processes of individual and of cultural development must stand in hostile opposition to each other and mutually dispute the ground. But this struggle between the individual and society is not a derivative of the contradiction – probably an irreconcilable one – between the primal drives of Eros and death. It is a dispute within the economics of the libido, comparable to the contest concerning the distribution of libido between ego and objects; and it does admit of an eventual accommodation in the individual, as, it may be hoped, it will also do in the future of civilization, however much that civilization may oppress the life of the individual today.

The analogy between the process of civilization and the path of individual development may be extended in an important respect. It can be asserted that the community, too, evolves a superego under whose influence cultural development proceeds. It would be a tempting task for anyone who has a knowledge of human civilizations to follow this analogy in detail. I will confine myself to bringing forward a few striking points. The superego of an epoch of civilization has an origin similar to that of an individual. It is based on the impression left behind by the personalities of great leaders – men of overwhelming force of mind or men in whom one of the human impulsions has found its strongest and purest, and therefore often its most one-sided, expression. In many

instances the analogy goes still further, in that during their lifetime these figures were – often enough, even if not always – mocked and maltreated by others and even despatched in a cruel fashion. In the same
[142] way, indeed, the primal father did not attain divinity until long after he had met his death by violence. The most arresting example of this fateful conjunction is to be seen in the figure of Jesus Christ – if, indeed, that figure is not a part of mythology, which called it into being from an obscure memory of that primal event. Another point of agreement between the cultural and the individual superego is that the former, just like the latter, sets up strict ideal demands, disobedience to which is visited with 'fear of conscience' [p. 115 above]. Here, indeed, we come across the remarkable circumstance that the mental processes concerned are actually more familiar to us and more accessible to consciousness as they are seen in the group than they can be in the individual man. In him, when tension arises, it is only the aggressiveness of the superego which, in the form of reproaches, makes itself noisily heard; its actual demands often remain unconscious in the background. If we bring them to conscious knowledge, we find that they coincide with the precepts of the prevailing cultural superego. At this point the two processes, that of the cultural development of the group and that of the cultural development of the individual, are, as it were, always interlocked. For that reason some of the manifestations and properties of the superego can be more easily detected in its behaviour in the cultural community than in the separate individual.

The cultural superego has developed its ideals and set up its demands. Among the latter, those which deal with the relations of human beings to one another are comprised under the heading of ethics. People have at all times set the greatest value on ethics, as though they expected that it, in particular, would produce especially important results. And it does in fact deal with a subject which can easily be recognized as the sorest spot in every civilization. Ethics is thus to be regarded as a therapeutic attempt – as an endeavour to achieve, by means of a command of the superego, something which has so far not been achieved by means of any other cultural activities. As we already know, the problem before us is how to get rid of the greatest hindrance to civilization – namely, the constitutional inclination of human beings to be aggressive towards one another; and for that very reason we are especially interested in what is probably the most recent of the cultural commands of the superego, the commandment to love one's neighbour as oneself. [Cf. p. 98 ff. above.] In our research into, and therapy of, a neurosis, we are led to make two

reproaches against the superego of the individual. In the severity of its [143]
commands and prohibitions it troubles itself too little about the happiness of the ego, in that it takes insufficient account of the resistances against obeying them – of the drive strength of the id [in the first place], and of the difficulties presented by the real external environment [in the second]. Consequently we are very often obliged, for therapeutic purposes, to oppose the superego, and we endeavour to lower its demands. Exactly the same objections can be made against the ethical demands of the cultural superego. It, too, does not trouble itself enough about the facts of the mental constitution of human beings. It issues a command and does not ask whether it is possible for people to obey it. On the contrary, it assumes that a man's ego is psychologically capable of anything that is required of it, that his ego has unlimited mastery over his id. This is a mistake; and even in what are known as normal people the id cannot be controlled beyond certain limits. If more is demanded of a man, a revolt will be produced in him or a neurosis, or he will be made unhappy. The commandment 'Love thy neighbour as thyself' is the strongest defence against human aggressiveness and an excellent example of the unpsychological proceedings of the cultural superego. The commandment is impossible to fulfil; such an enormous inflation of love can only lower its value, not get rid of the difficulty. Civilization pays no attention to all this; it merely admonishes us that the harder it is to obey the precept the more meritorious it is to do so. But anyone who follows such a precept in present-day civilization only puts himself at a disadvantage *vis-à-vis* the person who disregards it. What a potent obstacle to civilization aggressiveness must be, if the defence against it can cause as much unhappiness as aggressiveness itself! 'Natural' ethics, as it is called, has nothing to offer here except the narcissistic satisfaction of being able to think oneself better than others. At this point the ethics based on religion introduces its promises of a better afterlife. But so long as virtue is not rewarded here on earth, ethics will, I fancy, preach in vain. I too think it quite certain that a real change in the relations of human beings to possessions would be of more help in this direction than any ethical commands; but the recognition of this fact among socialists has been obscured and made useless for practical purposes by a fresh idealistic misconception of human nature. [Cf. p. 101 f. above.]

I believe the line of thought which seeks to trace in the phenomena [144]
of cultural development the part played by a superego promises still further discoveries. I hasten to come to a close. But there is one question

which I can hardly evade. If the development of civilization has such a far-reaching similarity to the development of the individual and if it employs the same methods, may we not be justified in reaching the diagnosis that, under the influence of cultural urges, some civilizations, or some epochs of civilization – possibly the whole of mankind – have become 'neurotic'?[1] An analytic dissection of such neuroses might lead to therapeutic recommendations which could lay claim to great practical interest. I would not say that an attempt of this kind to carry psychoanalysis over to the cultural community was absurd or doomed to be fruitless. But we should have to be very cautious and not forget that, after all, we are only dealing with analogies and that it is dangerous, not only with men but also with concepts, to tear them from the sphere in which they have originated and been evolved. Moreover, the diagnosis of communal neuroses is faced with a special difficulty. In an individual neurosis we take as our starting point the contrast that distinguishes the patient from his environment, which is assumed to be 'normal'. For a group all of whose members are affected by one and the same disorder no such background could exist; it would have to be found elsewhere. And as regards the therapeutic application of our knowledge, what would be the use of the most correct analysis of social neuroses, since no-one possesses authority to impose such a therapy upon the group? But in spite of all these difficulties, we may expect that one day someone will venture to embark upon a pathology of cultural communities.

For a wide variety of reasons, it is very far from my intention to express an opinion upon the value of human civilization. I have endeavoured to guard myself against the enthusiastic prejudice which holds that our civilization is the most precious thing that we possess or could acquire and that its path will necessarily lead to heights of unimagined perfection. I can at least listen without indignation to the critic who is of the
[145] opinion that when one surveys the aims of cultural endeavour and the means it employs, one is bound to come to the conclusion that the whole effort is not worth the trouble, and that the outcome of it can only be a state of affairs which the individual will be unable to tolerate. My impartiality is made all the easier to me by my knowing very little about all these things. One thing only do I know for certain and that is that man's judgements of value follow directly his wishes for happiness – that, accordingly, they are an attempt to support his illusions with

1 [Cf. some remarks in *The Future of an Illusion* (1927*c*), p. 40 f. above.]

arguments. I should find it very understandable if someone were to point out the obligatory nature of the course of human civilization and were to say, for instance, that the tendencies to a restriction of sexual life or to the institution of a humanitarian ideal at the expense of natural selection were developmental trends which cannot be averted or turned aside and to which it is best for us to yield as though they were necessities of nature. I know, too, the objection that can be made against this, to the effect that in the history of mankind, trends such as these, which were considered insurmountable, have often been thrown aside and replaced by other trends. Thus I have not the courage to rise up before my fellow men as a prophet, and I bow to their reproach that I can offer them no consolation: for at bottom that is what they are all demanding – the wildest revolutionaries no less passionately than the most virtuous believers.

The fateful question for the human species seems to me to be whether and to what extent their cultural development will succeed in mastering the disturbance of their communal life by the human drive to aggression and self-destruction. It may be that in this respect precisely the present time deserves a special interest. Men have gained control over the forces of nature to such an extent that with their help they would have no difficulty in exterminating one another to the last man. They know this, and hence comes a large part of their current disquiet, their unhappiness and their mood of anxiety. And now it is to be expected that the other of the two 'Heavenly Powers' [pp. 119–20 above], eternal Eros, will make an effort to assert himself in the struggle with his equally immortal adversary. But who can foresee with what success and with what result?[1]

1 [The final sentence was added in 1931 – when the menace of Hitler was already beginning to be apparent.]

FETISHISM

(1927)

The present translation is a slightly revised and corrected reprint of the *SE* version.

This paper was finished at the end of the first week of August, 1927 (Jones, 1957, 146), and was published almost simultaneously the same autumn in the *Almanach 1928* and in the last issue of the *Zeitschrift* for 1927.

In his earliest discussion of fetishism, in the *Three Essays* (1905*d*), *RSE*, **7**, 136–8, Freud wrote that 'no other variation of the sexual drive that borders on the pathological can lay so much claim to our interest as this one', and he in fact returned many times to a consideration of it. In this first account he did not go much further than maintaining that 'the choice of a fetish is an after-effect of some sexual impression, received as a rule in early childhood', and he left it at that in some passing comments on foot fetishism in his study on *Gradiva* (1907*a*) a year or two later (ibid., **9**, 36). His next approach to the subject seems to have been in an unpublished paper 'On the Genesis of Fetishism', read to the Vienna Psychoanalytical Society on February 24, 1909, but the minutes of this meeting were unfortunately not preserved (Nunberg & Federn, 1967, 163). At that time he was on the point of preparing the

[150] 'Rat Man' analysis (1909*d*) for publication, and in it he mentioned a fresh point – the connection of fetishism with pleasure in smell (*RSE*, **10**, 187) – which he enlarged upon in a footnote added to the *Three Essays* in its second edition of 1910 (ibid., **7**, 138 *n.* 3). But soon afterwards a new and more important connection must have occurred to him, for this same added footnote contained the first assertion that the fetish stands for the missing penis of the woman, which had figured prominently among the infantile sexual theories to which he had recently devoted a paper (1908*c*), ibid., **9**, 187–90. This new explanation of the fetish was also mentioned (as Freud remarks on p. 138 *n.* 1 below) in his study on Leonardo (1910*c*), *RSE*, **11**, 88–9, published very soon after the *Three Essays* footnote.

The special question of the origin of foot fetishism (referred to in the present paper, p. 140 below) attracted Freud's attention a few years later. On March 11, 1914, he read another paper to the Vienna Psychoanalytical Society, on 'A Case of Foot Fetishism'. The explanation of the choice of the foot as a fetish – approach to the woman's genitals from below – which was arrived at there, was published in a further addition to the same footnote of the *Three Essays* in its third edition of 1915. Another similar case history was reported very briefly by Freud in Lecture XXII of his *Introductory Lectures* (1916–17*a*), *RSE*, **16**. But though the present paper is of importance as bringing together and enlarging on Freud's earlier views on fetishism, its major interest lies in a very different direction – namely, in a fresh metapsychological development which it introduces. For several years past Freud had been using the concept of 'disavowal' ('*Verleugnung*') especially in relation to children's reactions to the observation of the anatomical distinction between the sexes.[1] And in the present paper, basing himself on fresh clinical observations, he puts forward reasons for supposing that this 'disavowal' necessarily implies a split in the subject's ego. At the end of his life Freud took up this question again and widened its scope:

[151] in a posthumously published paper on 'Splitting of the Ego in the Process of Defence' (1940*e* [1938]), ibid., **23**, and in the last paragraphs of Chapter VIII of *An Outline of Psychoanalysis* (1940*a* [1938]), ibid., **23**. But though fetishism is specially considered in both these works, Freud there points out that this 'splitting of the ego' is not peculiar to fetishism but is, in fact, to be found in many other situations in which the ego is faced with the necessity of constructing a defence, and that it occurs not only in disavowal but also in repression.[2]

1 See, for instance, the paper dealing explicitly with that subject (1925*j*), *RSE*, **19**, 249 ff., as well as the earlier ones on 'The Infantile Genital Organization' (1923*e*), ibid., **19**, 131 ff., 'The Economic Problem of Masochism' (1924*c*), ibid., **19**, 151 ff., and 'The Loss of Reality in Neurosis and Psychosis' (1924*e*), ibid., **19**, 179 ff.

2 It is perhaps not entirely fanciful to see a beginning of these ideas in a paper sent by Freud to Fliess on January 1, 1896 (Freud, 1950*a*, Draft K). In that paper Freud speaks of the final stage of the 'neuroses of defence' as involving a 'malformation' or 'alteration' of the ego. Something similar is even to be found earlier still, in the third section of the first paper on the neuropsychoses of defence (1894*a*), *RSE*, **3**, 54 ff.

FETISHISM

In the last few years I have had an opportunity of studying analytically [152]
a number of men whose object choice was dominated by a fetish. There is no need to expect that these people came to analysis on account of their fetish. For though no doubt a fetish is recognized by its adherents as an abnormality, it is seldom felt by them as the symptom of an ailment accompanied by suffering. Usually they are quite satisfied with it, or even praise the way in which it eases their erotic life. As a rule, therefore, the fetish made its appearance in analysis as a subsidiary finding.

For obvious reasons the details of these cases must be withheld from publication; I cannot, therefore, show in what way accidental circumstances have contributed to the choice of a fetish. The most extraordinary case seemed to me to be one in which a young man had exalted a certain sort of 'shine on the nose' into a fetishistic precondition. The surprising explanation of this was that the patient had been brought up in an English nursery but had later come to Germany, where he forgot his mother tongue almost completely. The fetish, which originated from his earliest childhood, had to be understood in English, not German. The 'shine on the nose' [in German '*Glanz auf der Nase*'] – was in reality a '*glance* at the nose'. The nose was thus the fetish, which, incidentally, he endowed at will with the luminous shine which was not perceptible to others.

In every instance, the meaning and the purpose of the fetish turned out, in analysis, to be the same. It revealed itself so naturally and seemed to me so compelling that I am prepared to expect the same solution in all cases of fetishism. When now I announce that the fetish is a substitute for the penis, I shall certainly create disappointment; so I hasten to add that it is not a substitute for any chance penis, but for a particular and quite special penis that had been extremely important in early childhood but had later been lost. That is to say, it should normally have been given up, but the fetish is precisely designed to preserve it

from extinction. To put it more plainly: the fetish is a substitute for the
[153] woman's (the mother's) penis that the little boy once believed in and – for reasons familiar to us – does not want to give up.[1]

What happened, therefore, was that the boy refused to take cognizance of the fact of his having perceived that a woman does not possess a penis. No, that could not be true: for if a woman had been castrated, then his own possession of a penis was in danger; and against that there rose in rebellion the portion of his narcissism which Nature has, as a precaution, attached to that particular organ. In later life a grown man may perhaps experience a similar panic when the cry goes up that Throne and Altar[2] are in danger, and similar illogical consequences will ensue. If I am not mistaken, Laforgue would say in this case that the boy 'scotomizes' his perception of the woman's lack of a penis.[3] A new technical term is justified when it describes a new fact or emphasizes it. This is not so here. The oldest word in our psychoanalytic terminology, 'repression', already relates to this pathological process. If we wanted to differentiate more sharply between the vicissitude [*Schicksal*][T] of the *idea* [*Vorstellung*][T] as distinct from that of the *affect*,[4] and reserve the word '*Verdrängung*'[T] ['repression'] for the affect, then the correct German word for the vicissitude of the idea would be '*Verleugnung*'[T] ['disavowal'].[5] 'Scotomization' seems to me particularly unsuitable, for
[154] it suggests that the perception is entirely wiped out, so that the result is the same as when a visual impression falls on the blind spot in the retina. In the situation we are considering, on the contrary, we see that the perception has persisted, and that a very energetic action has been undertaken to maintain the disavowal. It is not true that, after the child has made his observation of the woman, he has preserved unaltered his

1 This interpretation was made as early as 1910, in my study on Leonardo da Vinci, without any reasons being given for it. [*RSE*, **11**, 88–9. Cf. Editors' Note above, p. 136.]

2 [I.e. State and Church.]

3 I correct myself, however, by adding that I have the best reasons for supposing that Laforgue would not say anything of the sort. It is clear from his own remarks [Laforgue, 1926] that 'scotomization' is a term which derives from descriptions of dementia praecox, which does not arise from a carrying over of psychoanalytic concepts to the psychoses and which has no application to developmental processes or to the formation of neuroses. In his exposition in the text of his paper, the author has been at pains to make this incompatibility clear.

4 [Cf. 'Repression' (1915*d*), *RSE*, **14**, 135 f., and the Appendix to the first paper on the neuropsychoses of defence (1894*a*), ibid., **3**, 57 ff.]

5 [Some discussion of Freud's use of this term and of the English rendering of it appears in an Editors' footnote to the paper on 'The Infantile Genital Organization' (1923*e*), ibid., **19**, 133 *n.* 1, and in the Notes on the Translation of Some Technical Terms in ibid., **24**, 92. It may be remarked that in Chapter VIII of the *Outline of Psychoanalysis* (1940*a* [1938]), ibid., **23**, Freud makes a different distinction between the uses of the two words: 'repression' applies to defence against internal drive demands and 'disavowal' to defence against the claims of external reality.]

belief that women have a phallus. He has retained that belief, but he has also given it up. In the conflict between the weight of the unwelcome perception and the force of his counterwish, a compromise has been reached, as is only possible under the dominance of the unconscious laws of thought – the primary processes. Yes, in his mind the woman *has* got a penis, in spite of everything; but this penis is no longer the same as it was before. Something else has taken its place, has been appointed its substitute, as it were, and now inherits the interest which was formerly directed to its predecessor. But this interest suffers an extraordinary increase as well, because the horror of castration has set up a memorial to itself in the creation of this substitute. Furthermore, an aversion, which is never absent in any fetishist, to the real female genitals remains a *stigma indelebile* of the repression that has taken place. We can now see what the fetish achieves and what it is that maintains it. It remains a token of triumph over the threat of castration and a protection against it. It also saves the fetishist from becoming a homosexual, by endowing women with the characteristic which makes them tolerable as sexual objects. In later life, the fetishist feels that he enjoys yet another advantage from his substitute for a genital. The meaning of the fetish is not known to other people, so the fetish is not withheld from him: it is easily accessible and he can readily obtain the sexual satisfaction attached to it. What other men have to woo and make exertions for can be had by the fetishist with no trouble at all.

Probably no male human being is spared the fright [*Schreck*] of castration at the sight of a female genital. Why some people become homosexual as a consequence of that impression, while others fend it off by creating a fetish, and the great majority surmount it, we are frankly not able to explain. It is possible that, among all the factors at work, we do not yet know those which are decisive for the rare pathological results. We must be content if we can explain what has happened, and may for the present leave on one side the task of explaining why [155]
something has *not* happened.

One would expect that the organs or objects chosen as substitutes for the absent female phallus would be such as appear as symbols of the penis in other connections as well. This may happen often enough, but is certainly not a deciding factor. It seems rather that when the fetish is instituted some process occurs which reminds one of the stopping of memory in traumatic amnesia. As in this latter case, the subject's interest comes to a halt halfway, as it were; it is as though the last impression before the uncanny [*unheimlichen*] and traumatic one is retained as a

fetish. Thus the foot or shoe owes its preference as a fetish – or a part of it – to the circumstance that the inquisitive boy peered at the woman's genitals from below, from her legs up;[1] fur and velvet – as has long been suspected – are a fixation of the sight of the pubic hair, which should have been followed by the longed-for sight of the female member; pieces of underclothing, which are so often chosen as a fetish, crystallize the moment of undressing, the last moment in which the woman could still be regarded as phallic. But I do not maintain that it is invariably possible to discover with certainty how the fetish was determined.

An investigation of fetishism is strongly recommended to anyone who still doubts the existence of the castration complex or who can still believe that fright at the sight of the female genital has some other ground – for instance, that it is derived from a supposed recollection of the trauma of birth.[2]

For me, the explanation of fetishism had another point of theoretical interest as well. Recently, along quite speculative lines, I arrived at the proposition that the essential difference between neurosis and psychosis was that in the former the ego [*Ich*][T], in the service of reality, suppresses a piece of the id [*Es*], whereas in a psychosis it lets itself be induced by the id to detach itself from a piece of reality. I returned to this theme once again later on.[3] But soon after this I had reason to regret that I had ventured so far. In the analysis of two young men I learnt that each – one when he was two years old and the other when he was ten – had failed
[156] to take cognizance of the death of his beloved father – had 'scotomized' it – and yet neither of them had developed a psychosis. Thus a piece of reality which was undoubtedly important had been disavowed by the ego, just as the unwelcome fact of women's castration is disavowed in fetishists. I also began to suspect that similar occurrences in childhood are by no means rare, and I believed that I had been guilty of an error in my characterization of neurosis and psychosis. It is true that there was one way out of the difficulty. My formula needed only to hold good where there was a higher degree of differentiation in the psychical apparatus; things might be permissible to a child which would entail severe injury to an adult.

But further research led to another solution of the contradiction. It turned out that the two young men had no more 'scotomized' their

1 [Cf. Editors' Note, p. 136 above.]

2 [Cf. Rank, 1924, 22–4.]

3 'Neurosis and Psychosis' (1924*b*) [*RSE*, **19**, 141 ff.] and 'The Loss of Reality in Neurosis and Psychosis' (1924*e*) [ibid., **19**, 179 ff.].

father's death than a fetishist does the castration of women. It was only one current in their mental life that had not recognized their father's death; there was another current which took full account of that fact. The attitude which fitted in with the wish and the attitude which fitted in with reality existed side by side. In one of my two cases this split had formed the basis of a moderately severe obsessional neurosis. The patient oscillated in every situation in life between two assumptions: the one, that his father was still alive and was hindering his activities; the other, opposite one, that he was entitled to regard himself as his father's successor. I may thus keep to the expectation that in a psychosis the one current – that which fitted in with reality – would have, in fact, been absent.

Returning to my description of fetishism, I may say that there are many and weighty additional proofs of the divided attitude of fetishists to the question of the castration of women. In very subtle instances both the disavowal and the affirmation of the castration have found their way into the construction [*Aufbau*][T] of the fetish itself. This was so in the case of a man whose fetish was an athletic support-belt which could also be worn as bathing drawers. This piece of clothing covered up the genitals entirely and concealed the distinction between them. Analysis showed that it signified that women were castrated and that they were not castrated; and it also allowed of the hypothesis that men were castrated, for all these possibilities could equally well be concealed under the belt – the earliest rudiment of which in his childhood had been the [157]
fig-leaf on a statue. A fetish of this sort, doubly derived from contrary ideas, is of course especially durable. In other instances the divided attitude shows itself in what the fetishist does with his fetish, whether in reality or in his imagination [*Phantasie*][T]. To point out that he reveres his fetish is not the whole story; in many cases he treats it in a way which is obviously equivalent to a representation of castration. This happens particularly if he has developed a strong identification with his father and plays the part of the latter; for it is to him that as a child he ascribed the woman's castration. Affection and hostility in the treatment of the fetish – which run parallel with the disavowal and the acknowledgement of castration – are mixed in unequal proportions in different cases, so that the one or the other is more clearly recognizable. We seem here to approach an understanding, even if a distant one, of the behaviour of the '*coupeur de nattes*'.[1] In him the need to carry out the castration

1 [A pervert who enjoys cutting off the hair of females. Part of the present explanation was given by Freud in his study of Leonardo (1910*c*), *RSE*, **11**, 88–9.]

which he disavows has come to the front. His action contains in itself the two mutually incompatible assertions: 'the woman has still got a penis' and 'my father has castrated the woman'. Another variant, which is also a parallel to fetishism in social psychology, might be seen in the Chinese custom of mutilating the female foot and then revering it like a fetish after it has been mutilated. It seems as though the Chinese male wants to thank the woman for having submitted to being castrated.

In conclusion, we may say that the normal prototype of fetishes is a man's penis, just as the normal prototype of inferior organs is a woman's real small penis, the clitoris.[1]

1 [This is an allusion to Adler's insistence on 'organ inferiority' as the basis of all neuroses. Cf. a footnote to the paper on 'Some Psychical Consequences of the Anatomical Distinction between the Sexes' (1925*j*), *RSE*, **19**, 254 *n.* 3, and a longer discussion in Lecture XXXI of the *New Introductory Lectures* (1933*a*), ibid., **22**, 58 f.]

HUMOUR

The present translation is a slightly revised reprint of the *SE* version.

Freud wrote this paper in five days during the second week of August, 1927 (Jones, 1957, 146), and it was read on his behalf by Anna Freud on September 1, before the Tenth International Psychoanalytical Congress at Innsbruck. It was first published in the autumn of the same year in the psychoanalytic *Almanac* for 1928.

The paper returns, after an interval of more than twenty years, to the subject discussed in the last section of the book on *Jokes* (1905*c*), *RSE*, **8**. Freud now considers it in the light of his new structural picture of the human mind. Some interesting metapsychological points emerge in the later pages of the paper, and for the first time we find the superego presented in an amiable mood.

HUMOUR

In my volume on *Jokes and their Relation to the Unconscious* (1905*c*), I in fact considered humour only from the economic point of view. My object was to discover the source of the pleasure [*Lust*][T] obtained from humour, and I think I was able to show that the yield of humorous pleasure arises from an economy in expenditure upon feeling. [*RSE*, **8**, 204–5.] [161]

There are two ways in which the humorous process can take place. It may take place in regard to a single person, who himself adopts the humorous attitude, while a second person plays the part of the spectator who derives enjoyment from it; or it may take place between two persons, of whom one takes no part at all in the humorous process, but is made the object of humorous contemplation by the other. When, to take the crudest example [ibid., 199], a criminal who was being led out to the gallows on a Monday remarked: 'Well, the week's beginning nicely', he was producing the humour himself; the humorous process is completed in his own person and obviously affords him a certain sense of satisfaction. I, the non-participating listener, am affected as it were at long range by this humorous production of the criminal's; I feel, like him, perhaps, the yield of humorous pleasure.

We have an instance of the second way in which humour arises when a writer or a narrator describes the behaviour of real or imaginary people in a humorous manner. There is no need for those people to display any humour themselves; the humorous attitude is solely the business of the person who is taking them as his object; and, as in the former instance, the reader or hearer shares in the enjoyment of the humour. To sum up, then, we can say that the humorous attitude – whatever it may consist in – can be directed either towards the subject's own self or towards other people; it is to be assumed that it brings a yield of pleasure to the person who adopts it, and a similar yield of pleasure falls to the share of the non-participating onlooker.

We shall best understand the genesis of the yield of humorous

pleasure if we consider the process in the listener before whom someone
[162] else produces humour. He sees this other person in a situation which leads the listener to expect that the other will produce the signs of an affect – that he will get angry, complain, express pain, be frightened or horrified or perhaps even in despair; and the onlooker or listener is prepared to follow his lead and to call up the same emotional impulses
Regung [*Gefühlsregungen*][T] in himself. But this emotional expectancy is disappointed; the other person expresses no affect, but makes a jest. The expenditure on feeling that is economized turns into humorous pleasure in the listener.

It is easy to get so far. But we soon tell ourselves that it is the process which takes place in the other person – the 'humorist' – that merits the greater attention. There is no doubt that the essence of humour is that one spares oneself the affects to which the situation would naturally give rise and dismisses the possibility of such expressions of emotion with a jest. As far as this goes, the process in the humorist must tally with the process in the hearer – or, to put it more correctly, the process in the hearer must have copied the one in the humorist. But how does the latter bring about the psychical attitude which makes a release of affect superfluous? What are the dynamics of his adoption of the 'humorous attitude'? Clearly, the solution to the problem is to be sought in the humorist; in the hearer we must assume that there is only an echo, a copy, of this unknown process.

It is now time to acquaint ourselves with a few of the characteristics of humour. Like jokes and the comic, humour has something liberating about it; but it also has something of grandeur and elevation, which is lacking in the other two ways of obtaining pleasure from intellectual activity. The grandeur in it clearly lies in the triumph of narcissism, the victorious assertion of the ego's [*Ichs*][T] invulnerability. The ego refuses to be distressed by the provocations of reality, to let itself be compelled to suffer. It insists that it cannot be affected by the traumas of the external world; it shows, in fact, that such traumas are no more than occasions for it to gain pleasure. This last feature is a quite essential element of humour. Let us suppose that the criminal who was being led to execution on Monday had said: 'It doesn't worry me. What does it matter, after all, if a fellow like me is hanged? The world won't come to an end because of it.' We should have to admit that such a speech does, in fact, display the same magnificent superiority over the real situation. It is
[163] wise and true; but it does not betray a trace of humour. Indeed, it is based on an appraisal of reality which runs directly counter to the

appraisal made by humour. Humour is not resigned; it is rebellious. It signifies the triumph not only of the ego but also of the pleasure principle, which is able here to assert itself against the unkindness of the real circumstances.

These last two features – the rejection of the claims of reality and the putting through of the pleasure principle – bring humour near to the regressive or reactionary processes which engage our attention so extensively in psychopathology. Its fending off [*Abwehr*][T] of the possibility of suffering places it among the great series of methods which human mental life [*Seelenleben*][T] has constructed in order to evade the compulsion to suffer – a series which begins with neurosis and culminates in madness and which includes intoxication, self-absorption and ecstasy.[1] Thanks to this connection, humour possesses a dignity which is wholly lacking, for instance, in jokes, for jokes either serve simply to obtain a yield of pleasure or place the yield of pleasure that has been obtained in the service of aggression. In what, then, does the humorous attitude consist, an attitude by means of which a person refuses to suffer, emphasizes the invincibility of his ego by the real world, victoriously maintains the pleasure principle – and all this, in contrast to other methods having the same purposes, without overstepping the bounds of mental health? The two achievements seem incompatible. *Seele*

If we turn to the situation in which one person adopts a humorous attitude towards others, a view [*Auffassung*][T] which I have already put forward tentatively in my book on jokes will at once suggest itself. This is that the subject is behaving towards them as an adult does towards a child when he recognizes and smiles at the triviality of interests and sufferings which seem so great to it [ibid., 203]. Thus the humorist would acquire his superiority by assuming the role of the grown-up and identifying himself to some extent with his father, and reducing the other people to being children. This view probably covers the facts, but it hardly seems a conclusive one. One asks oneself what it is that makes the humorist arrogate this role to himself.

But we must recall the other, probably more primary and important, [164]
situation of humour, in which a person adopts a humorous attitude towards himself in order to ward off possible suffering. Is there any sense in saying that someone is treating himself like a child and is at the same time playing the part of a superior adult towards that child?

1 [Cf. the subsequent long discussion of these various methods of avoiding pain in Chapter II of *Civilization and its Discontents* (1930*a*), p. 70 ff. above. But Freud had already pointed out the defensive function of humour in *Jokes* (1905*c*), *RSE*, **8**, 202–3.]

This not very plausible idea [*Vorstellung*]^{T} receives strong support, I think, if we consider what we have learnt from pathological observations on the structure [*Struktur*]^{T} of the ego. This ego is not a simple entity. It harbours within it, as its nucleus, a special agency – the superego [*Über-Ich*]^{T,I}. Sometimes it is merged with the superego so that we cannot distinguish between them, whereas in other circumstances it is sharply differentiated from it. Genetically [*Genetisch*]^{T} the superego is the heir to the parental agency. It often keeps the ego in strict dependence and still really treats it as the parents, or the father, once treated the child, in its early years. We obtain a dynamic explanation of the humorous attitude, therefore, if we assume that it consists in the humorist's having withdrawn the psychical accent from his ego and having transposed it on to his superego. To the superego, thus inflated, the ego can appear tiny and all its interests trivial; and, with this new distribution of energy, it may become an easy matter for the superego to suppress the ego's possibilities of reacting.

In order to remain faithful to our customary phraseology, we shall have to speak, not of transposing the psychical accent, but of displacing
Besetzung [*Verschiebung*]^{T} large amounts of cathexis [*Besetzungsmengen*]^{T}. The question then is whether we are entitled to picture extensive displacements like this from one agency of the mental apparatus to another. It looks like a new hypothesis constructed *ad hoc*. Yet we may remind ourselves that we have repeatedly (even though not sufficiently often) taken a factor of this kind into account in our attempts at a metapsychological picture [*Vorstellung*] of mental events. Thus, for instance, we supposed that the difference between an ordinary erotic object cathexis and the state of being in love is that in the latter incomparably more cathexis passes over to the object and that the ego empties itself as it
[165] were in favour of the object.[2] In studying some cases of paranoia I was able to establish the fact that ideas of persecution are formed early and exist for a long time without any perceptible effect, until, as the result of some particular precipitating event, they receive sufficient amounts of cathexis to cause them to become dominant.[3] The cure, too, of such paranoic attacks would lie not so much in a resolution and correction of the delusional ideas as in a withdrawal from them of the cathexis which has been lent to them. The alternation between melancholia and

1 [It may be remarked that in a footnote at the beginning of Chapter III of *The Ego and the Id* (1923*b*) Freud says that 'the system *Pcpt.-Cs.* alone can be regarded as the nucleus of the ego' (*RSE*, **19**, 24 *n.* 2).]

2 [See Chapter VIII of *Group Psychology* (1921*c*), ibid., **18**, 104–5.]

3 [See Section B of 'Some Neurotic Mechanisms' (1922*b*), ibid., **18**, 219–20.]

mania, between a cruel suppression of the ego by the superego and a liberation of the ego after that pressure, suggests a shift of cathexis of this kind;[1] such a shift, moreover, would have to be brought in to explain a whole number of phenomena belonging to normal mental life. If this has been done hitherto only to a very limited extent, that is on account of our usual caution – something which deserves only praise. The region in which we feel secure is that of the pathology of mental life; it is here that we make our observations and acquire our convictions. For the present we venture to form a judgement on the normal mind only insofar as we can discern what is normal in the isolations and distortions of the pathological material. When once we have overcome this hesitancy we shall recognize what a large contribution is made to the understanding of mental processes by the static conditions as well as by the dynamic changes in the *quantity* of energic cathexis.

I think, therefore, that the possibility I have suggested here, that in a particular situation the subject suddenly hypercathects his superego and then, proceeding from it, alters the reactions of the ego, is one which deserves to be retained. Moreover, what I have suggested about humour finds a remarkable analogy in the kindred field of jokes. As regards the origin of jokes I was led to assume that a preconscious thought is given over for a moment to unconscious revision [ibid., 144]. A joke is thus the contribution made to the comic by the unconscious [ibid., 180]. In just the same way, *humour would be the contribution made to the comic through the agency of the superego.*

In other connections we knew the superego as a severe master. It will [166]
be said that it accords ill with such a character that the superego should condescend to enabling the ego to obtain a small yield of pleasure. It is true that humorous pleasure never reaches the intensity of the pleasure in the comic or in jokes, that it never finds vent in hearty laughter. It is also true that, in bringing about the humorous attitude, the superego is actually repudiating reality and serving an illusion. But (without rightly knowing why) we regard this less intense pleasure as having a character of very high value; we feel it to be especially liberating and elevating. Moreover, the jest made by humour is not the essential thing. It has only the value of a preliminary. The main thing is the intention which humour carries out, whether it is acting in relation to the self or other people. It means: 'Look! here is the world, which seems so dangerous! It is nothing but a game for children – just worth making a jest about!'

If it is really the superego which, in humour, speaks such kindly words

1 [See 'Mourning and Melancholia' (1916–17*g* [1915]), *RSE*, **14**, 226–8.]

of comfort to the intimidated ego, this will teach us that we have still a great deal to learn about the nature of the superego. Furthermore, not everyone is capable of the humorous attitude. It is a rare and precious gift, and many people are even without the capacity to enjoy humorous pleasure that is presented to them. And finally, if the superego tries, by means of humour, to console the ego and protect it from suffering, this does not contradict its origin in the parental agency.

A RELIGIOUS EXPERIENCE

The present translation is a slightly corrected reprint of the *SE* version.

This paper, published early in 1928, was written, according to Ernest Jones (1957, 151), at the end of 1927. Viereck's visit to Freud which was the starting point of the events leading to the writing of the paper took place, as Jones tells us (ibid., 133), in late June of 1926. Viereck (a fairly well-known American journalist who had an interest in psychoanalysis) published his account of the visit in the autumn of the following year. It was reprinted in a volume, *Glimpses of the Great* (1930, 28 ff.), and some extracts from it are given by Jones (loc. cit.).

It may be noticed that the text of the letter from the American doctor to Freud does not agree exactly with the German version. The English version given here is a reprint of that given originally in the *International Journal*, and there is reason to suppose that its editors used a copy of the English autograph of the letter, of which Freud had not given a quite exact rendering. The differences between the two versions are, however, trivial.

A RELIGIOUS EXPERIENCE

In the autumn of 1927, G. S. Viereck, a German-American journalist who had paid me a welcome visit, published an account of a conversation with me, in the course of which he mentioned my lack of religious faith and my indifference on the subject of survival after death. This 'interview', as it was called, was widely read and brought me, among others, the following letter from an American physician:[1] [169]

'. . . What struck me most was your answer to the question whether you believe in a survival of personality after death. You are reported as having said: "I give no thought to the matter."

'I am writing now to tell you of an experience that I had in the year I graduated at the University of X. One afternoon while I was passing through the dissecting room my attention was attracted to a sweet-faced dear old woman who was being carried to a dissecting table. This sweet-faced woman made such an impression on me that a thought flashed up in my mind: "There is no God: if there were a God he would not have allowed this dear old woman to be brought into the dissecting room."

'When I got home that afternoon the feeling I had had at the sight in the dissecting room had determined me to discontinue going to church. The doctrines of Christianity had before this been the subject of doubts in my mind.

'While I was meditating on this matter a voice spoke to my soul that "I should consider the step I was about to take". My spirit replied to this inner voice by saying, "If I knew of a certainty that Christianity was truth and the Bible was the Word of God, then I would accept it."

'In the course of the next few days God made it clear to my soul that the Bible was His Word, that the teachings about Jesus Christ were true, and that Jesus was our only hope. After such a clear revelation I accepted the Bible as God's Word and Jesus Christ as my personal Saviour. Since then God has revealed Himself to me by many infallible proofs.

1 [See Editors' Note on p. 155 above.]

[170] 'I beg you as a brother physician to give thought to this most important matter, and I can assure you, if you look into this subject with an open mind, God will reveal the *truth* to your soul, the same as he did to me and to multitudes of others. . . .'

I sent a polite answer, saying that I was glad to hear that this experience had enabled him to retain his faith. As for myself, God had not done so much for me. He had never allowed me to hear an inner voice; and if, in view of my age, He did not make haste, it would not be my fault if I remained to the end of my life what I now was – 'an infidel Jew'.[1]

In the course of a friendly reply, my colleague gave me an assurance that being a Jew was not an obstacle in the pathway to true faith and proved this by several instances. His letter culminated in the information that prayers were being earnestly addressed to God that He might grant me 'faith to believe'.[1]

I am still awaiting the outcome of this intercession. In the meantime, my colleague's religious experience provides food for thought. It seems to me to demand some attempt at an interpretation [*Deutung*][T] based upon emotional motives [*Motiven*][T]; for his experience is puzzling in itself and is based on particularly bad logic. God, as we know, allows horrors to take place of a kind very different from the removal to a dissecting room of the dead body of a pleasant-looking old woman. This has been true at all times, and it must have been so while my American colleague was pursuing his studies. Nor, as a medical student, can he have been so sheltered from the world as to have known nothing of such evils. Why was it, then, that his indignation against God broke out precisely when he received this particular impression in the dissecting room?

For anyone who is accustomed to regard men's internal experiences and actions analytically the explanation is very obvious – so obvious that it actually crept into my recollections of the facts themselves. Once, when I was referring to my pious colleague's letter in the course of a discussion, I spoke of his having written that the dead woman's face had reminded him of his own mother. In fact, these words were not in his letter, and a moment's reflection will show that they could not possibly have been. But that is the explanation irresistibly forced on us by his
[171] affectionately phrased description of the 'sweet-faced dear old woman'.[1] Thus the weakness of judgement displayed by the young doctor is to be accounted for by the emotion roused in him by the memory of his

1 [In English in the original.]

mother. It is difficult to escape from the bad psychoanalytic habit of bringing forward as evidence details which also allow of more superficial explanations – and I am tempted to recall the fact that my colleague addressed me later as a 'brother physician'.[1]

We may suppose, therefore, that this was the way in which things happened. The sight of a woman's dead body, naked or on the point of being stripped, reminded the young man of his mother. It roused in him a longing for his mother which sprang from his Oedipus complex, and this was immediately completed by a feeling of indignation against his father. His ideas of 'father' and 'God' had not yet become widely separated; so that his desire to destroy his father could become conscious as doubt in the existence of God and could seek to justify itself in the eyes of reason as indignation about the ill-treatment of a mother object. It is, of course, typical for a child to regard what his father does to his mother in sexual intercourse as ill-treatment. The new impulse, which was displaced [*verschobene Regung*][T] into the sphere of religion, was only a repetition of the Oedipus situation and consequently soon met with a similar fate [*Schicksal*][T]. It succumbed to a powerful opposing current. During the actual conflict the level of displacement was not maintained: there is no mention of arguments in justification of God, nor are we told what the infallible signs were by which God proved His existence to the doubter. The conflict seems to have been unfolded in the form of a hallucinatory psychosis: inner voices were heard which uttered warnings against resistance to God. But the outcome of the struggle was displayed once again in the sphere of religion and it was of a kind predetermined by the fate of the Oedipus complex: complete submission to the will of God the Father. The young man became a believer and accepted everything he had been taught since his childhood about God and Jesus Christ. He had had a religious experience and had undergone a conversion.

Verschiebung

All of this is so simple and straightforward that we cannot but ask ourselves whether by understanding this case we have thrown any light at all on the psychology of conversion in general. I may refer the reader to an admirable volume on the subject by Sante de Sanctis (1924), which incidentally takes all the findings of psychoanalysis into account. Study of this work confirms our expectation that by no means every case of conversion can be understood so easily as this one. In no respect, however, does our case contradict the views arrived at on the subject by modern research. The point which our present observation throws into

[172]

1 [In English in the original.]

relief is the manner in which the conversion was attached to a particular determining event, which caused the subject's scepticism to flare up for a last time before being finally extinguished.

DOSTOEVSKY AND PARRICIDE

The present translation is a very slightly revised and corrected reprint of the *SE* version.

From 1925 onwards, Fülöp-Miller and Eckstein began issuing a series of volumes supplementary to the great complete German edition of Dostoevsky which, edited by Moeller van den Bruck, had been completed a few years earlier. The new volumes, uniform with the complete edition, contained posthumous writings, unfinished drafts and material from various sources throwing light on Dostoevsky's character and works. One of these volumes was to contain a collection of preliminary drafts and sketches relating to *The Brothers Karamazov* and a discussion of the book's sources; and the editors were anxious to persuade Freud to contribute an introduction dealing with the psychology both of the book and of its author. [176]

They seem to have approached him early in 1926 and he had begun writing his essay by the end of June of that year. He was deflected from it, however, by the urgent necessity for producing his pamphlet on lay analysis (1926*e*) in view of the proceedings which had been begun against Theodor Reik (*RSE*, **20**, 160). Thereafter he seems to have lost interest in the Dostoevsky essay, particularly, as Ernest Jones tells us (1957, 152), after he had come across a book on the same subject by Neufeld (1923), which, as he says in a footnote (p. 180 *n.* below) – with considerable modesty, it must be remarked – contained most of the ideas that he himself was putting forward. It is not clear when he took the essay up again. Jones (loc. cit.) suggests that it was finished early in 1927; but this seems scarcely likely, since Stefan Zweig's story with which the later part of the essay is concerned only appeared in 1927. The volume to which Freud's essay served as an introduction (*The Original Version of the Brothers Karamazov*) was not published until the autumn of 1928.

The essay falls into two distinct parts. The first deals with Dostoevsky's character in general, with his masochism, his sense of guilt, his 'epileptoid' attacks and his double attitude in the Oedipus complex. The second discusses the special point of his passion for gambling and leads to an account of a short story by Stefan Zweig which throws light on the genesis of that addiction. As will be seen from a subsequent letter of Freud's to Theodor Reik, which we print as an Appendix (p. 181 below), the two parts of the essay are more closely related than appears on the surface.

The present essay may show signs of being an 'occasional' piece, but it contains much that is of interest – for instance, Freud's first discussion of hysterical attacks since his early paper on the subject written twenty years before (1909*a*), a restatement of his later views on the Oedipus complex and the sense of guilt, and a sidelight on the problem of masturbation which is not to be found in his earlier account of the question (1912*f*), *RSE*, **12**. It also contains his fullest discussion of the topic of seizure disorders, which had interested him since earliest times (1888*b*), ibid., **1**, 61 f. But above all, he had an opportunity here for expressing his views on a writer whom he placed in the very front rank of all.

DOSTOEVSKY AND PARRICIDE

Four facets may be distinguished in the rich personality of Dostoevsky: [177]
the creative artist [*Dichter*], the neurotic, the moralist and the sinner. How is one to find one's way in this bewildering complexity?

The creative artist is the least doubtful: Dostoevsky's place is not far behind Shakespeare. *The Brothers Karamazov* is the most magnificent novel ever written; the episode of the Grand Inquisitor, one of the peaks in the literature of the world, can hardly be valued too highly. Before the problem of the creative artist analysis must, alas, lay down its arms.

The moralist in Dostoevsky is the most readily assailable. If we seek to rank him high as a moralist on the plea that only a man who has gone through the depths of sin can reach the highest summit of morality, we are neglecting a doubt that arises. A moral man is one who reacts to temptation as soon as he feels it in his heart, without yielding to it. A man who alternately sins and then in his remorse erects high moral standards lays himself open to the reproach that he has made things too easy for himself. He has not achieved the essence of morality, renunciation, for the moral conduct of life is a practical human interest. He reminds one of the barbarians of the great migrations, who murdered and did penance for it, till penance became an actual technique for enabling murder to be done. Ivan the Terrible behaved in exactly this way; indeed, this compromise with morality is a characteristic Russian trait. Nor was the final outcome of Dostoevsky's moral strivings anything very glorious. After the most violent struggles to reconcile the drive demands [*Triebansprüche*]^{T} of the individual with the claims of the *Trieb*
community, he landed in the retrograde position of submission both to temporal and spiritual authority, of veneration both for the Tsar and for the God of the Christians, and of a narrow Russian nationalism – a position which lesser minds have reached with smaller effort. This is the weak point in that great personality. Dostoevsky threw away the chance of becoming a teacher and liberator of humanity and made himself one with their gaolers. The future of human civilization [*kulturelle*]^{T} will *Kultur*

have little to thank him for. It seems probable that he was condemned
[178] to this failure by his neurosis. The greatness of his intelligence and the strength of his love for humanity might have opened to him another, an apostolic, way of life.

To consider Dostoevsky as a sinner or a criminal rouses violent opposition, which need not be based upon a philistine assessment of criminals. The real motive [*Motivs*][T] for this opposition soon becomes apparent. Two traits are essential in a criminal: boundless egoism and a strong destructive urge. Common to both of these, and a necessary condition for their expression, is absence of love, lack of an emotional appreciation of (human) objects. One at once recalls the contrast to this presented by Dostoevsky – his great need of love and his enormous capacity for love, which is to be seen in manifestations of exaggerated kindness and caused him to love and to help where he had a right to hate and to be revengeful, as, for example, in his relations with his first wife and her lover. That being so, it must be asked why there is any temptation to reckon Dostoevsky among the criminals. The answer is that it comes from his choice of material, which singles out from all others violent, murderous and egoistic characters, thus pointing to the existence of similar tendencies within himself, and also from certain facts in his life, like his passion for gambling and his possible confession to a sexual assault upon a young girl.[I] The contradiction is resolved by the realization that Dostoevsky's very strong destructive drive [*Destruktionstrieb*], which might easily have made him a criminal, was in his actual life directed mainly against his own person (inwards instead of outwards) and thus found expression as masochism and a sense of guilt. Nevertheless, his personality retained sadistic traits in plenty, which show themselves in his irritability, his love of tormenting and his intolerance even towards
[179] people he loved, and which appear also in the way in which, as an author, he treats his readers. Thus in little things he was a sadist towards others, and in bigger things a sadist towards himself, in fact a masochist – that is to say the mildest, kindliest, most helpful person possible.

We have selected three factors from Dostoevsky's complex personality, one quantitative and two qualitative: the extraordinary intensity

1 See the discussion of this in Fülöp-Miller & Eckstein (1926). Stefan Zweig (1920) writes: 'He was not halted by the barriers of bourgeois morality; and no-one can say exactly how far he transgressed the bounds of law in his own life or how much of the criminal instincts [*Instinkten*] of his heroes was realized in himself.' For the intimate connection between Dostoevsky's characters and his own experiences, see René Fülöp-Miller's remarks in the introductory section of Fülöp-Miller & Eckstein (1925), which are based upon N. Strakhov [1921]. – [The topic of a sexual assault on an immature girl appears several times in Dostoevsky's writings – especially in the posthumous *Stavrogin's Confession* and *The Life of a Great Sinner.*]

of his emotional life, his perverse innate drive disposition [*Triebanlage*], which inevitably marked him out to be a sadomasochist or a criminal, and his unanalysable artistic gift. This combination might very well exist without neurosis; there are people who are complete masochists without being neurotic. Nevertheless, the balance of forces [*Kräfteverhältnis*]^{T} *Kraft* between his drive demands and the inhibitions [*Hemmungen*]^{T} opposing them (plus the available methods of sublimation) would even so make it necessary to classify Dostoevsky as what is known as a 'driven character' ['*triebhafter Charakter*']. But the position is obscured by the simultaneous presence of neurosis, which, as we have said, was not in the circumstances inevitable, but which comes into being the more readily, the richer the complication which has to be mastered by the ego [*Ich*]^{T}. For neurosis is after all only a sign that the ego has not succeeded in making a synthesis, that in attempting to do so it has forfeited its unity.

How then, strictly speaking, does his neurosis show itself? Dostoevsky called himself an epileptic, and was regarded as such by other people, on account of his severe attacks, which were accompanied by loss of consciousness, muscular convulsions and subsequent depression. Now it is highly probable that this so-called epilepsy was only a symptom of his neurosis and must accordingly be classified as hystero-epilepsy – that is, as severe hysteria. We cannot be completely certain on this point for two reasons – firstly, because the anamnestic data on Dostoevsky's alleged epilepsy are defective and untrustworthy, and secondly, because our understanding of pathological states combined with epileptiform attacks is imperfect.

To take the second point first. It is unnecessary here to reproduce the whole pathology of epilepsy, for it would throw no decisive light on the problem. But this may be said. The old *morbus sacer* is still in evidence as an ostensible clinical entity, the uncanny [*unheimliche*] disease with its incalculable, apparently unprovoked convulsive attacks, its changing of the character into irritability and aggressiveness, and its progressive lowering of all the mental faculties. But the outlines of this picture are [180] quite lacking in precision. The attacks, so savage in their onset, accompanied by biting of the tongue and incontinence of urine and working up to the dangerous *status epilepticus* with its risk of severe self-injuries, may, nevertheless, be reduced to brief periods of *absence*, or rapidly passing fits of vertigo or may be replaced by short spaces of time during which the patient does something out of character, as though he were under the control of his unconscious. These attacks, though as a rule

determined, in a way we do not understand, by purely physical causes, may nevertheless owe their first appearance to some purely mental
Seele [*seelischen*]^{T} cause (a fright, for instance) or may react in other respects to mental excitations [*Erregungen*]^{T}. However characteristic intellectual impairment may be in the overwhelming majority of cases, at least *one* case is known to us (that of Helmholtz) in which the affliction did not interfere with the highest intellectual achievement. (Other cases of which the same assertion has been made are either disputable or open to the same doubts as the case of Dostoevsky himself.) People who are victims of epilepsy may give an impression of dullness and arrested development just as the disease often accompanies the most palpable idiocy and the grossest cerebral defects, even though not as a necessary component of the clinical picture. But these attacks, with all their variations, also occur in other people who display complete mental development and, if anything, an excessive and as a rule insufficiently controlled emotional life. It is no wonder in these circumstances that it has been found impossible to maintain that 'epilepsy' is a single clinical entity. The similarity that we find in the manifest symptoms seems to call for a functional view [*Auffassung*]^{T} of them. It is as though a mech-
abführen anism for abnormal drive discharge [*Triebabfuhr*]^{T} had been laid down organically, which could be made use of in quite different circumstances – both in the case of disturbances of cerebral activity due to severe histolytic or toxic affections, and also in the case of inadequate control over the mental economy and at times when the activity of the energy operating in the mind reaches crisis pitch. Behind this dichotomy we have a glimpse of the identity of the underlying mechanism of drive discharge. Nor can that mechanism stand remote from the sexual processes, which are fundamentally of toxic origin:[1] the earliest physicians described coition as a minor epilepsy, and thus recognized in the sexual
[181] act a mitigation and adaptation of the epileptic method of discharging stimuli.[2]

The 'epileptic reaction', as this common element may be called, is also undoubtedly at the disposal of the neurosis whose essence it is to get rid by somatic means of amounts of excitation which it cannot deal with psychically. Thus the epileptic attack becomes a symptom of hysteria and is adapted and modified by it just as it is by the normal sexual process of discharge. It is therefore quite right to distinguish between an organic and an 'affective' epilepsy. The practical significance of this is

1 [See Editors' footnote, p. 72 above.]

2 [Cf. Freud's earlier paper on hysterical attacks (1909*a*), *RSE*, **9**, 205.]

that a person who suffers from the first kind has a disease of the brain, while a person who suffers from the second kind is a neurotic. In the first case his mental life is subjected to an alien disturbance from without, in the second case the disturbance is an expression of his mental life itself.

It is extremely probable that Dostoevsky's epilepsy was of the second kind. This cannot, strictly speaking, be proved. To do so we should have to be in a position to insert the first appearance of the attacks and their subsequent fluctuations into the thread of his mental life; and for that we know too little. The descriptions of the attacks themselves teach us nothing and our information about the relations between them and Dostoevsky's experiences is defective and often contradictory. The most probable assumption is that the attacks went back far into his childhood, that their place was taken to begin with by milder symptoms and that they did not assume an epileptic form until after the shattering experience of his eighteenth year – the murder of his father.[1] It would be very much to the point if it could be established that they ceased [182]
completely during his exile in Siberia, but other accounts contradict this.[2]

The unmistakable connection between the murder of the father in *The Brothers Karamazov* and the fate of Dostoevsky's own father has struck more than one of his biographers, and has led them to refer to 'a certain modern school of psychology'. From the standpoint of psychoanalysis (for that is what is meant), we are tempted to see in that event the severest trauma and to regard Dostoevsky's reaction to it as the turning point of his neurosis. But if I undertake to substantiate this view psychoanalytically, I shall have to risk the danger of being unintelligible

1 See René Fülöp-Miller (1924). [Cf. also the account given by Aimée Dostoevsky (1921) in her life of her father.] Of special interest is the information that in the novelist's childhood 'something terrible, unforgettable and agonizing' happened, to which the first signs of his illness were to be traced (from an article by Suvorin in the newspaper *Novoe Vremya*, 1881, quoted in the introduction to Fülöp-Miller & Eckstein, 1925, xlv). See also Orest Miller (1921, 140): 'There is, however, another special piece of evidence about Fyodor Mikhailovich's illness, which relates to his earliest youth and brings the illness into connection with a tragic event in the family life of his parents. But, although this piece of evidence was given to me orally by one who was a close friend of Fyodor Mikhailovich, I cannot bring myself to reproduce it fully and precisely since I have had no confirmation of this rumour from any other quarter.' Biographers and scientific research workers cannot feel grateful for this discretion.

2 Most of the accounts, including Dostoevsky's own, assert on the contrary that the illness only assumed its final, epileptic character during the Siberian exile. Unfortunately, there is reason to distrust the autobiographical statements of neurotics. Experience shows that their memories introduce falsifications which are designed to interrupt disagreeable causal connections. Nevertheless, it appears certain that Dostoevsky's detention in the Siberian prison markedly altered his pathological condition. Cf. Fülöp-Miller (1924, 1186).

to all those readers who are unfamiliar with the language and theories of psychoanalysis.

We have one certain starting point. We know the meaning of the first attacks from which Dostoevsky suffered in his early years, long before the onset of the 'epilepsy'. These attacks had the significance of death: they were heralded by a fear of death and consisted of lethargic, somnolent states. The illness first came over him while he was still a boy, in the form of a sudden, groundless melancholy, a feeling, as he later told his friend Soloviev, as though he were going to die on the spot. And there, in fact, followed a state very similar to real death. His brother Andrey tells us that even when he was quite young Fyodor used to leave little notes about before he went to sleep, saying that he was afraid he might fall into this death-like sleep during the night and therefore begged that his burial should be postponed for five days. (Fülöp-Miller & Eckstein, 1925, lx.)

We know the meaning and intention of such death-like attacks.[1] They
[183] signify an identification with a dead person, either with someone who is really dead or with someone who is still alive and whom the subject wishes dead. The latter case is the more significant. The attack then has the value of a punishment. One has wished another person dead, and now one *is* this other person and is dead oneself. At this point psychoanalytical theory brings in the assertion that for a boy this other person is usually his father and that the attack (which is termed hysterical) is thus a self-punishment for a death wish against a hated father.

Parricide, according to a well-known view, is the principal and primal crime of humanity as well as of the individual. (See my *Totem and Taboo*, 1912–13*a*.) It is in any case the main source of the sense of guilt, though we do not know if it is the only one: researches have not yet been able to establish with certainty the mental origin of guilt and the need for expiation. But it is not necessary for it to be the only one. The psychological situation is complicated and requires elucidation. The relation of a boy to his father is, as we say, an 'ambivalent' one. In addition to the hate which seeks to get rid of the father as a rival, a measure of tenderness for him is also habitually present. The two attitudes of mind combine to produce identification with the father; the boy wants to be in his father's place because he admires him and wants to be like him, and also because he wants to put him out of the way. This whole development now comes up against a powerful obstacle. At a

1 [The explanation was already given by Freud in a letter to Fliess of February 8, 1897 (Freud, 1950*a*, Letter 58).]

certain moment the child comes to understand that an attempt to remove his father as a rival would be punished by him with castration. So from fear of castration – that is, in the interests of preserving his masculinity – he gives up his wish to possess his mother and get rid of his father. Insofar as this wish remains in the unconscious it forms the basis of the sense of guilt. We believe that what we have here been describing are normal processes, the normal fate of the so-called 'Oedipus complex'; nevertheless, it requires an important amplification.

A further complication arises when the constitutional factor we call bisexuality is comparatively strongly developed in a child. For then, under the threat to the boy's masculinity by castration, his inclination becomes strengthened to diverge in the direction of femininity, to put himself instead in his mother's place and take over her role as object of his father's love. But the fear of castration makes *this* solution impossible as well. The boy understands that he must also submit to [184]
castration if he wants to be loved by his father as a woman. Thus both impulses, hatred of the father and being in love with the father, undergo repression [*Verdrängung*]^{T}. There is a certain psychological distinction in the fact that the hatred of the father is given up on account of fear of an *external* danger (castration), while the being in love with the father is treated as an *internal* drive danger, though fundamentally it goes back to the same external danger.

What makes hatred of the father unacceptable is *fear* [*Angst*]^{T} of the father; castration is terrible, whether as a punishment or as the price of love. Of the two factors which repress hatred of the father, the first, the direct fear of punishment and castration, may be called the normal one; its pathogenic intensification seems to come only with the addition of the second factor, the fear of the feminine attitude. Thus a strong innate bisexual disposition becomes one of the preconditions or reinforcements of neurosis. Such a disposition must certainly be assumed in Dostoevsky, and it shows itself in a viable form (as latent homosexuality) in the important part played by male friendships in his life, in his strangely tender attitude towards rivals in love and in his remarkable understanding of situations which are explicable only by repressed homosexuality, as many examples from his novels show.

I am sorry, though I cannot alter the facts, if this exposition of the attitudes of hatred and love towards the father and their transformations under the influence of the threat of castration seems to readers unfamiliar with psychoanalysis unsavoury and incredible. I should myself expect that it is precisely the castration complex that would be

bound to arouse the most general repudiation. But I can only insist that psychoanalytic experience has put these matters in particular beyond the reach of doubt and has taught us to recognize in them the key to every neurosis. This key, then, we must apply to our author's so-called epilepsy. So alien to our consciousness are the things by which our unconscious mental life is governed!

But what has been said so far does not exhaust the consequences of the repression of the hatred of the father in the Oedipus complex. There is something fresh to be added: namely that in spite of everything the identification with the father finally makes a permanent place for itself in the ego. It is received into the ego, but establishes itself there as
[185] a separate agency in contrast to the rest of the content of the ego. We then give it the name of superego [*Über-Ich*][T] and ascribe to it, the inheritor of the parental influence, the most important functions. If the father was hard, violent and cruel, the superego takes over those attributes from him and, in the relations between the ego and it, the passivity which was supposed to have been repressed is re-established. The superego has become sadistic, and the ego becomes masochistic – that is to say, at bottom passive in a feminine way. A great need for punishment develops in the ego, which in part offers itself as a victim to Fate [*Schicksal*][T], and in part finds satisfaction in ill-treatment by the superego (that is, in the sense of guilt). For every punishment is ultimately castration and, as such, a fulfilment of the old passive attitude towards the father. Even Fate is, in the last resort, only a later projection of the father.

The normal processes in the formation of conscience must be similar to the abnormal ones described here. We have not yet succeeded in fixing the boundary line between them. It will be observed that here the largest share in the outcome is ascribed to the passive component of repressed femininity. In addition, it must be of importance as an accidental factor whether the father, who is feared in any case, is also especially violent in reality. This was true in Dostoevsky's case, and we can trace back the fact of his extraordinary sense of guilt and of his masochistic conduct of life to a specially strong feminine component. Thus the formula for Dostoevsky is as follows: a person with a specially strong innate bisexual disposition, who can defend himself with special intensity against dependence on a specially severe father. This characteristic of bisexuality comes as an addition to the components of his nature that we have already recognized. His early symptoms of death-like attacks can thus be understood as a father identification on the part of his ego, which is permitted by his superego as a punishment. 'You

wanted to kill your father in order to be your father yourself. Now you *are* your father, but a dead father' – the regular mechanism of hysterical symptoms. And further: 'Now your father is killing *you*.' For the ego the death symptom is a satisfaction in phantasy [*Phantasiebefriedigung*][T] *Phantasie* of the masculine wish and at the same time a masochistic satisfaction; for the superego it is a punitive satisfaction – that is, a sadistic satisfaction. Both of them, the ego and the superego, carry on the role of father.

To sum up, the relation between the subject and his father object, [186] while retaining its content, has been transformed into a relation between the ego and the superego – a new setting on a fresh stage. Infantile reactions from the Oedipus complex such as these may disappear if reality gives them no further nourishment. But the father's character remained the same, or rather, it deteriorated with the years, and thus Dostoevsky's hatred for his father and his death wish against that wicked father were maintained. Now it is a dangerous thing if reality fulfils such repressed wishes. The phantasy has become reality and all defensive measures are thereupon reinforced. Dostoevsky's attacks now assumed an epileptic character; they still undoubtedly signified an identification with his father as a punishment, but they had become terrible, like his father's frightful death itself. What further content they had absorbed, particularly what sexual content, escapes conjecture.

One thing is remarkable: in the aura of the epileptic attack, one moment of supreme bliss is experienced. This may very well be a record of the triumph and sense of liberation felt on hearing the news of the death, to be followed immediately by an all the more cruel punishment. We have divined just such a sequence of triumph and mourning, of festive joy and mourning, in the brothers of the primal horde who murdered their father, and we find it repeated in the ceremony of the totem meal.[1] If it proved to be the case that Dostoevsky was free from his attacks in Siberia, that would merely substantiate the view that they were his punishment. He did not need them any longer when he was being punished in another way. But that cannot be proved. Rather does this necessity for punishment on the part of Dostoevsky's mental economy explain the fact that he passed unbroken through these years of misery and humiliation. Dostoevsky's condemnation as a political prisoner was unjust and he must have known it, but he accepted the undeserved punishment at the hands of the Little Father, the Tsar, as a substitute for the punishment he deserved for his sin against his real father. Instead of punishing himself, he got himself punished by his

1 See *Totem and Taboo* [(1912–13*a*), Section 5 of Essay IV; *RSE*, **13**, 129].

father's deputy. Here we have a glimpse of the psychological justification of the punishments inflicted by society. It is a fact that large groups
[187] of criminals want to be punished. Their superego demands it and so saves itself the necessity for inflicting the punishment itself.[1]

Everyone who is familiar with the complicated transformation of meaning undergone by hysterical symptoms will understand that no attempt can be made here to follow the meaning of Dostoevsky's attacks beyond this beginning.[2] It is enough that we may assume that their original meaning remained unchanged behind all later accretions. We can safely say that Dostoevsky never got free from the feelings of guilt arising from his intention of murdering his father. They also determined his attitude in the two other spheres in which the father relation is the decisive factor, his attitude towards the authority of the State and towards belief in God. In the first of these he ended up with complete submission to his Little Father, the Tsar, who had once performed with him in *reality* the comedy of killing which his attacks had so often represented in *play*. Here penitence gained the upper hand. In the religious sphere he retained more freedom: according to apparently trustworthy reports he wavered, up to the last moment of his life, between faith and atheism. His great intellect made it impossible for him to overlook any of the intellectual difficulties to which faith leads. By an individual recapitulation of a development in world history he hoped to find a way out and a liberation from guilt in the Christ ideal, and even to make use of his sufferings as a claim to be playing a Christ-like role. If on the whole he did not achieve freedom and became a reactionary, that was because the filial guilt, which is present in human beings generally and on which religious feeling is built, had in him attained a super-individual intensity and remained insurmountable even to his great intelligence.
[188] In writing this we are laying ourselves open to the charge of having abandoned the impartiality of analysis and of subjecting Dostoevsky to judgements that can only be justified from the partisan standpoint of a particular *Weltanschauung*. A conservative would take the side of the Grand Inquisitor and would judge Dostoevsky differently. The

1 [Cf. 'Criminals from a Sense of Guilt', the third essay in Freud's 'Some Character-Types Met with in Psychoanalytic Work' (1916*d*), *RSE*, **14**, 335.]

2 The best account of the meaning and content of his attacks was given by Dostoevsky himself, when he told his friend Strakhov that his irritability and depression after an epileptic attack were due to the fact that he seemed to himself a criminal and could not get rid of the feeling that he had a burden of unknown guilt upon him, that he had committed some great misdeed, which oppressed him. (Fülöp-Miller, 1924, 1188.) In self-accusations like these psychoanalysis sees signs of a recognition of 'psychical reality', and it endeavours to make the unknown guilt known to consciousness.

objection is just; and one can only say in extenuation that Dostoevsky's decision has every appearance of having been determined by an intellectual inhibition due to his neurosis.

It can scarcely be owing to chance that three of the masterpieces of the literature of all time – the *Oedipus Rex* of Sophocles, Shakespeare's *Hamlet* and Dostoevsky's *The Brothers Karamazov* – should all deal with the same subject, parricide. In all three, moreover, the motive for the deed, sexual rivalry for a woman, is laid bare.

The most straightforward is certainly the representation in the drama derived from the Greek legend. In this it is still the hero himself who commits the crime. But poetic treatment is impossible without softening and disguise. The naked admission of an intention to commit parricide, as we arrive at it in analysis, seems intolerable without analytic preparation. The Greek drama, while retaining the crime, introduces the indispensable toning down in a masterly fashion by projecting the hero's unconscious motive into reality in the form of a compulsion by a destiny [*Schicksalszwang*]T which is alien to him. The hero commits the deed *Zwang*
unintentionally and apparently uninfluenced by the woman; this latter element is, however, taken into account in the circumstance that the hero can only obtain possession of the queen mother after he has repeated his deed upon the monster who symbolizes the father. After his guilt has been revealed and made conscious, the hero makes no attempt to exculpate himself by appealing to the artificial expedient of the compulsion of destiny. His crime is acknowledged and punished as though it were a full and conscious one – which is bound to appear unjust to our reason, but which psychologically is perfectly correct.

In the English play the presentation is more indirect; the hero does not commit the crime himself; it is carried out by someone else, for whom it is not parricide. The forbidden motive of sexual rivalry for the woman does not need, therefore, to be disguised. Moreover, we see the hero's Oedipus complex, as it were, in a reflected light, by [189]
learning the effect upon him of the other's crime. He ought to avenge the crime, but finds himself, strangely enough, incapable of doing so. We know that it is his sense of guilt that is paralysing him; but, in a manner entirely in keeping with neurotic processes, the sense of guilt is displaced on to the perception of his inadequacy for fulfilling his task. There are signs that the hero feels this guilt as a super-individual one. He despises others no less than himself: 'Use every man after his desert, and who should 'scape whipping?'

The Russian novel goes a step further in the same direction. There

also the murder is committed by someone else. This other person, however, stands to the murdered man in the same filial relation as the hero, Dmitri, in whom the motive of sexual rivalry is openly admitted; the murderer is a brother of the hero's, and it is a remarkable fact that Dostoevsky has attributed to him his own illness, the alleged epilepsy, as though he were seeking to confess that the epileptic, the neurotic, in himself was a parricide. Then, again, in the speech for the defence at the trial, there is the famous mockery of psychology – it is a 'knife that cuts both ways':[1] a splendid piece of disguise, for we have only to reverse it in order to discover the deepest meaning of Dostoevsky's view of things. It is not psychology that deserves the mockery, but the procedure of judicial enquiry. It is a matter of indifference who actually committed the crime; psychology is only concerned to know who desired it emotionally and who welcomed it when it was done.[2] And for that reason all of the brothers, except the contrasted figure of Alyosha, are equally guilty – the impulsive sensualist, the sceptical cynic and the epileptic criminal. In *The Brothers Karamazov* there is one particularly revealing scene. In the course of his talk with Dmitri, Father Zossima recognizes that Dmitri is prepared to commit parricide, and he bows down at his feet. It is impossible that this can be meant as an expression of admiration; it must mean that the holy man is rejecting the temptation to
[190] despise or detest the murderer and for that reason humbles himself before him. Dostoevsky's sympathy for the criminal is, in fact, boundless; it goes far beyond the pity which the unhappy wretch has a right to, and reminds us of the 'holy awe' with which epileptics and lunatics were regarded in the past. A criminal is to him almost a Redeemer, who has taken on himself the guilt which must else have been borne by others. There is no longer any need for one to murder, since *he* has already murdered; and one must be grateful to him, for, except for him, one would have been obliged oneself to murder. That is not kindly pity alone, it is identification on the basis of similar murderous impulses – in fact, a slightly displaced narcissism. (In saying this, we are not disputing the ethical value of this kindliness.) This may perhaps be quite generally the mechanism of kindly sympathy with other people, a mechanism which one can discern with particular ease in this extreme case of a guilt-ridden novelist. There is no doubt that this sympathy by

1 [In the German (and in the original Russian) the simile is 'a stick with two ends'. The 'knife that cuts both ways' is derived from Constance Garnett's English translation. The phrase occurs in Book XII, Chapter X, of the novel.]

2 [A practical application of this to an actual criminal case can be found in Freud's comments on the Halsmann Case (1930*i*), p. 244 ff. below, where *The Brothers Karamazov* is again discussed.]

identification was a decisive factor in determining Dostoevsky's choice of material. He dealt first with the common criminal (whose motives are egotistical) and the political and religious criminal; and not until the end of his life did he come back to the primal criminal, the parricide, and use him, in a work of art, for making his confession.

The publication of Dostoevsky's posthumous papers and of his wife's diaries has thrown a glaring light on one episode in his life, namely the period in Germany when he was obsessed with a mania for gambling (cf. Fülöp-Miller & Eckstein, 1925), which no-one could regard as anything but an unmistakable fit of pathological passion. There was no lack of rationalizations for this remarkable and unworthy behaviour. As often happens with neurotics, Dostoevsky's sense of guilt had taken a tangible shape as a burden of debt, and he was able to take refuge behind the pretext that he was trying by his winnings at the tables to make it possible for him to return to Russia without being arrested by his creditors. But this was no more than a pretext and Dostoevsky was acute enough to recognize the fact and honest enough to admit it. He knew that the chief thing was gambling for its own sake – *le jeu pour le jeu*.[1] All the details of his impulsively irrational conduct show this and something more besides. He never rested until he had lost everything. For him gambling was a method of self-punishment as well. Time after time he gave his young wife his promise or his word of honour not to play any more or not to play any more on that particular day; and, as she says, he almost always broke it. When his losses had reduced himself and her to the direst need, he derived a second pathological satisfaction from that. He could then scold and humiliate himself before her, invite her to despise him and to feel sorry that she had married such an old sinner; and when he had thus unburdened his conscience, the whole business would begin again next day. His young wife accustomed herself to this cycle, for she had noticed that the one thing which offered any real hope of salvation – his literary production – never went better than when they had lost everything and pawned their last possessions. Naturally she did not understand the connection. When his sense of guilt was satisfied by the punishments he had inflicted on himself, the inhibition upon his work became less severe and he allowed himself to take a few steps along the road to success.[2] [191]

1 'The main thing is the play itself,' he writes in one of his letters. 'I swear that greed for money has nothing to do with it, although Heaven knows I am sorely in need of money.'

2 'He always remained at the gaming tables till he had lost everything and was totally ruined. It was only when the damage was quite complete that the demon at last retired from his soul and made way for the creative genius.' (Fülöp-Miller & Eckstein, 1925, lxxxvi.)

What part of a gambler's long-buried childhood is it that forces its way to repetition in his obsession for play [*Spielzwang*]? The answer may be divined without difficulty from [*in Anlehnung an*][T] a story by one of our younger writers. Stefan Zweig, who has incidentally devoted a study to Dostoevsky himself (1920), has included in his collection of three stories *Die Verwirrung der Gefühle* [*Confusion of Feelings*] (1927) one which he calls 'Vierundzwanzig Stunden aus dem Leben einer Frau' ['Four-and-Twenty Hours in a Woman's Life']. This little masterpiece ostensibly sets out only to show what an irresponsible creature woman is, and to what excesses, surprising even to herself, an unexpected experience may impel her. But the story tells far more than this. If it is subjected to an analytical interpretation [*Deutung*][T], it will be found to represent (without any apologetic intent) something quite different, something universally human, or rather something masculine.
[192] And such an interpretation is so extremely obvious that it cannot be resisted. It is characteristic of the nature of artistic creation that the author, who is a personal friend of mine, was able to assure me, when I asked him, that the interpretation which I put to him had been completely strange to his knowledge and intention, although some of the details woven into the narrative seemed expressly designed to give a clue to the hidden secret.

In this story, an elderly lady of distinction tells the author about an experience she has had more than twenty years earlier. She has been left a widow when still young and is the mother of two sons, who no longer need her. In her forty-second year, expecting nothing further of life, she happens, on one of her aimless journeyings, to visit the Rooms at Monte Carlo. There, among all the remarkable impressions which the place produces, she is soon fascinated by the sight of a pair of hands which seem to betray all the feelings of the unlucky gambler with terrifying sincerity and intensity. These hands belong to a handsome young man – the author, as though unintentionally, makes him of the same age as the narrator's elder son – who, after losing everything, leaves the Rooms in the depth of despair, with the evident intention of ending his hopeless life in the Casino gardens. An inexplicable feeling of sympathy compels her to follow him and make every effort to save him. He takes her for one of the importunate women so common there and tries to shake her off; but she stays with him and finds herself obliged, in the most natural way possible, to join him in his apartment at the hotel, and finally to share his bed. After this improvised night of love, she exacts a most solemn vow from the young man, who has now apparently calmed

down, that he will never play again, provides him with money for his journey home and promises to meet him at the station before the departure of his train. Now, however, she begins to feel a great tenderness for him, is ready to sacrifice all she has in order to keep him and makes up her mind to go with him instead of saying goodbye. Various mischances delay her, so that she misses the train. In her longing for the lost one she returns once more to the Rooms and there, to her horror, sees once more the hands which had first excited her sympathy: the faithless youth had gone back to his play. She reminds him of his promise, but, obsessed by his passion, he calls her a spoilsport, tells her to go, and flings back the money with which she has tried to rescue him. She hurries away in [193] deep mortification and learns later that she has not succeeded in saving him from suicide.

The brilliantly told, faultlessly motivated story is of course complete in itself and is certain to make a deep effect upon the reader. But analysis shows us that its invention is based fundamentally upon a wishful phantasy belonging to the period of puberty, which a number of people actually remember consciously. The phantasy embodies a boy's wish that his mother should herself initiate him into sexual life in order to save him from the dreaded injuries caused by masturbation. (The numerous creative works that deal with the theme of redemption have the same origin.) The 'vice' of masturbation is replaced by the addiction to gambling;[1] and the emphasis laid upon the passionate activity of the hands betrays this derivation. Indeed, the passion for play is an equivalent of the old compulsion to masturbate [*Onaniezwanges*]; 'playing' is the actual word used in the nursery to describe the activity of the hands upon the genitals. The irresistible nature of the temptation, the solemn resolutions, which are nevertheless invariably broken, never to do it again, the stupefying pleasure [*Lust*][T] and the bad conscience which tells the subject that he is ruining himself (committing suicide) – all these elements remain unaltered in the process of substitution. It is true that Zweig's story is told by the mother, not by the son. It must flatter the son to think: 'if my mother only knew what dangers masturbation involves me in, she would certainly save me from them by allowing me to lavish all my tenderness on her own body.' The equation of the mother with a prostitute, which is made by the young man in the story, is linked up with the same phantasy. It brings the unattainable woman within easy reach. The bad conscience which accompanies the phantasy

1 [In a letter to Fliess of December 22, 1897, Freud suggested that masturbation is the 'primal addiction', for which all later addictions are substitutes (Freud, 1950*a*, Letter 79), *RSE*, **1**, 298.]

brings about the unhappy ending of the story. It is also interesting to notice how the façade given to the story by its author seeks to disguise its analytic meaning. For it is extremely questionable whether the erotic life of women is dominated by sudden and mysterious impulses. On the contrary, analysis reveals an adequate motivation for the surprising behaviour of this woman who had hitherto turned away from love. Faithful to the memory of her dead husband, she had armed herself [194] against all similar attractions; but – and here the son's phantasy is right – she did not, as a mother, escape her quite unconscious transference of *Übertragung* love [*Liebesübertragung*][T] on to her son, and Fate was able to catch her at this undefended spot.

If the addiction to gambling, with the unsuccessful struggles to break the habit and the opportunities it affords for self-punishment, is a repetition of the compulsion to masturbate, we shall not be surprised to find that it occupied such a large space in Dostoevsky's life. After all, we find no cases of severe neurosis in which the auto-erotic satisfaction of early childhood and of puberty has not played a part; and the relation between efforts to suppress it and fear of the father are too well known to need more than a mention.[1]

1 Most of the views which are here expressed are also contained in an excellent book by Jolan Neufeld (1923).

APPENDIX

A LETTER FROM FREUD TO THEODOR REIK

A few months after the publication of Freud's essay on Dostoevsky, a discussion of it by Theodor Reik appeared in *Imago* (in the second issue for 1929, **15**, 232–42). Though Reik's comments were on the whole appreciative, he argued at considerable length that Freud's judgement on Dostoevsky's morals was unjustifiably severe and disagreed too with what Freud wrote about morality in the third paragraph of the essay. He also, incidentally, criticized the *form* of the essay, with its apparently disconnected tail-end. After reading these criticisms[1] Freud sent Reik a letter in reply; and when, not long afterwards, Reik reprinted his article in a book of collected papers (1930), Freud agreed that an extract from his letter should also be included. It was subsequently reprinted in *GW*, **Nachtr.** (1987), 668–9. An English translation of the criticism and of the reply to it were published in Reik's *From Thirty Years with Freud* (New York, 1940; London, 1942). It is with Theodor Reik's kind permission that Freud's letter to him is published here, in an amended translation by James Strachey (slightly further revised by Mark Solms). [195]

APRIL 14, 1929

. . . I have read your critical review of my Dostoevsky study with great enjoyment. All your objections deserve consideration and must be recognized as in a sense apt. I can bring forward a little in my defence. But, of course, it will not be a question of who is right or who is wrong.

I think you are applying too high a standard to this triviality. It was written as a favour to someone[2] and written reluctantly. I always write reluctantly nowadays. No doubt you noticed this about it. This is not meant, of course, to excuse hasty or false judgements, but merely the careless architecture of the essay as a whole. I cannot dispute the inharmonious effect produced by the addition of the Zweig analysis; but deeper examination will perhaps show some justification for it. If I had not been hampered by considerations of the place where my essay was to appear, I should certainly have written: 'We may expect that in the history of a neurosis accompanied by such a severe sense of guilt a [196]

1 [See footnote 2, p. 182 below.]

2 [No doubt Eitingon, who had persistently pressed Freud to finish the essay (Jones, 1957, 152).]

special part will be played by the struggle against masturbation. This expectation is completely fulfilled by Dostoevsky's pathological addiction to gambling. For, as we can see from a short story of Zweig's . . . etc.' That is to say, the amount of space given to the short story corresponds not to the relation: Zweig–Dostoevsky, but to the other one: masturbation–neurosis. All the same, the outcome was clumsy.

I hold firmly to a scientifically objective social assessment of ethics, and for that reason I should not wish to deny the excellent Philistine a certificate of good ethical conduct, even though it has cost him little self-discipline.[1] But alongside of this I grant the validity of the subjective psychological view of ethics which you support. Though I agree with your judgement of the world and mankind as they are today, I cannot, as you know, regard your pessimistic dismissal of a better future as justified.

As you suggest, I included Dostoevsky the psychologist under the creative artist. Another objection I might have raised against him was that his insight was so much restricted to abnormal mental life. Consider his astonishing helplessness in face of the phenomena of love. All he really knew were crude, driven [*triebhafte*] desire, masochistic subjection and loving out of pity. You are right, too, in suspecting that, in spite of all my admiration for Dostoevsky's intensity and pre-eminence, I do not really like him. That is because my patience with pathological natures is exhausted in analysis. In art and life I am intolerant of them. Those are character traits personal to me and not binding on others.

Where are you going to publish your essay?[2] I rate it very highly. It is only scientific research that must be without presumptions. In every other kind of thinking the choice of a point of view cannot be avoided; and there are, of course, several of these . . .

1 [Reik had written: 'Renunciation was once the criterion of morality; today it is only one of many. If it were the only one, then the excellent citizen and Philistine, who, with his dull sensibility, submits to the authorities and for whom renunciation is made much easier by his lack of imagination, would be far superior to Dostoevsky in morality.']

2 [This seems to show that Reik had shown Freud his criticism before its publication in *Imago*, though it is possible that what Freud had in mind was the question of the reprint.]

SOME DREAMS OF DESCARTES'

A Letter to Maxime Leroy

(1929)

EDITORS' NOTE

BRIEF AN MAXIM [*sic*] LEROY: ÜBER EINEN TRAUM DES CARTESIUS

FRENCH EDITIONS

1929 In Leroy's *Descartes, le philosophe au masque*, **1**, Paris: Editions Rieder, 89–90. [199]
1934 *GS*, **12**, 403–5. (Reprint of Freud's letter and extracts from Leroy's book.)
1948 *GW*, **14**, 558–60. (Reprint of above.)

ENGLISH TRANSLATION

'Some Dreams of Descartes': A Letter to Maxime Leroy'
1961 *SE*, **21**, 203–4. (Tr. Angela Richards.)

The present translation is a reprint of the *SE* version.

No German original of this letter is extant. The French version was almost certainly made by Leroy, and it provides at best an unsatisfactory basis for the English translation.

While Maxime Leroy was preparing his book on Descartes (1929), he submitted a series of the philosopher's dreams[1] to Freud for his comments. We cannot tell exactly what account Leroy gave Freud of the dreams, for the German editions do not print the text of his actual letter but merely quote the description of the dreams from Leroy's published volume, in which he also printed his translation of Freud's reply to his enquiry.

Descartes' original account and interpretation of the dreams seem to have occupied the opening pages of a manuscript known as the 'Olympica', which was probably written during the winter of 1619–20 and which is now lost. It was, however, seen by the seventeenth-century abbé, Adrien Baillet, who published a paraphrased translation, containing some quotations from the original Latin, in his *Vie de Monsieur Des-Cartes* (Paris, 1691, **1**). The account of the dreams is on pp. 81–5. It is on this version that Leroy based his account, but it seems certain that Freud studied Baillet's full text, since, for example, Freud speaks in his reply of 'the melon from a foreign land' – a phrase which appears in Baillet's transcription – whereas in his book Leroy simply mentions 'a melon'. [200]

1 What was in question was a *set* of dreams dreamt on the same night and not a single one, as the German title implies. Freud himself refers to them in the plural (p. 189 below).

The manuscript of the 'Olympica' was also seen by Leibniz, who made a copy of extracts from it. Unfortunately Leibniz's notes contain only one brief reference to the dreams: '*Somnium 1619, nov. in quo carmen 7 cujus initium: Quod vitae sectabor iter? . . . Auson*'.[1] Since he makes no mention of having seen the 'explanation' of the dreams, Leroy was inclined to think that it was, to a great extent at least, a fabrication of the Abbé Baillet – a view which he expresses in his book, although no hint of it seems to have reached Freud.[2]

Leroy's published account of the dreams (1929, **1**, 84) – a paraphrase of Baillet's version – which appears (in French) as a footnote in the German editions of Freud, is as follows:

'Then, during the night, when all was fever, thunderstorms, panic, phantoms rose before the dreamer. He tried to get up in order to drive them away. But he fell back, ashamed of himself, feeling troubled by a great weakness in his right side. All at once, a window in the room opened. Terrified, he felt himself carried away by the gusts of a violent wind, which made him whirl round several times on his left foot.

'Dragging himself staggering along, he reached the buildings of the college in which he had been educated. He tried desperately to enter the chapel, to make his devotions. At that moment some people passed by. He wanted to stop in order to speak to them; he noticed that one of them was carrying a melon. But a violent wind drove him back towards the chapel.

'He then woke up, with twinges of sharp pain in his left side. He did not know whether he was dreaming or awake. Half-awake, he told himself that an evil genius was trying to seduce him, and he murmured a prayer to exorcise it.

'He went to sleep again. A clap of thunder woke him again and filled his room with flashes. Once more he asked himself whether he was asleep or awake, whether it was a dream or a daydream, opening and shutting his eyes so as to reach a certainty. Then, reassured, he dozed off, swept away by exhaustion.

[201] 'With his brain on fire, excited by these rumours and vague sufferings, Descartes opened a dictionary and then a collection of poems. The intrepid traveller dreamt of this line: "*Quod vitae sectabor iter?*" Another journey in the land of dreams? Then suddenly there appeared a man he did not know, intending to make him read a passage from Ausonius beginning with the words "*Est et non*".[3] But the man disappeared and another took his place. The book vanished in its turn, then reappeared decorated with portraits in copperplate. Finally, the night grew quiet.'

The explanation of the dreams, which Leroy (ibid., 85) quotes from Baillet (also printed as a footnote in the German editions of Freud), is as follows:

'He [Descartes] considered that the "dictionary" merely meant all the Sciences combined; and that the "collection of poems", entitled *Corpus Poetarum*, indicated particularly and more distinctly Philosophy and Wisdom united . . . M. Descartes,

1 'A dream 1619, November, in which Ode VII, which begins: What path in life shall I follow? . . . Ausonius.' Cf. Descartes, 1859–60, **1**, 8.

2 For a full discussion of this whole problem, cf. Gouhier, 1958.

3 'What path in life shall I follow?' and "'Yea" and "Nay"'. The odes quoted are Nos. 2 and 4 of Book VII.

continuing to interpret his dream while he was asleep, thought that the piece of verse on the uncertainty of the kind of life one should choose, and beginning "*Quod vitae sectabor iter?*" indicated good advice from a wise person, or even Moral Theology . . .

'By the poets brought together in the collection he understood Revelation and Enthusiasm, with which he did not despair of being favoured. By the piece of verse "*Est et non*" (which is the Yea and Nay of Pythagoras) he understood Truth and Falsehood in human knowledge and the profane sciences. Seeing that the application of all these things was so successfully to his liking, he was bold enough to persuade himself that it was the Spirit of Truth which had chosen to open all the treasures of science to him by this dream. And since nothing was left for him to explain but the little Portraits in copperplate [*taille douce*] which he had found in the second book, he sought no longer for their explanation after an Italian painter had paid him a visit the very next day.

'This last dream, which contained nothing but what was very pleasant [*doux*] and very agreeable, indicated the future, he thought: and it was concerned only with what was to occur to him during the rest of his life. But he took the two earlier ones as threatening warnings in regard to his past life, which might not have been so [202] innocent in God's eyes as in those of men. And he thought this was the reason for the terror and fright with which those two dreams were accompanied. The melon with which they tried to present him in the first dream meant, he said, the charms of solitude, but presented by purely human inducements. The wind which drove him towards the college Church, when he had a pain in his right side, was nothing other than the evil Genius trying to throw him by force into a place which it was his intention to enter voluntarily. That was why God did not allow him to advance further, or to let himself be carried even to a holy place by a Spirit which He had not sent – although he was very much convinced that it had been a Spirit of God who had led him to make his first approaches to this Church. The terror with which he was struck in the second dream indicated, in his view, his synderesis – that is to say, the remorse of his conscience regarding the sins he might have committed during the course of his life up till then. The thunder of which he heard the crash was the signal of the spirit of truth descending on him to take possession of him.'

SOME DREAMS OF DESCARTES'

A Letter to Maxime Leroy

On considering your letter asking me to examine some dreams of [203]
Descartes', my first feeling was an impression of dismay, since working on dreams without being able to obtain from the dreamer himself any indications on the relations which might link them to one another or attach them to the external world – and this is clearly the case when it is a question of the dreams of a historical figure – gives, as a general rule, only a meagre result. In the event my task turned out to be easier than I had anticipated; nevertheless, the fruit of my investigations will no doubt seem to you much less important than you had a right to expect.

Our philosopher's dreams are what are known as 'dreams from above' ('*Träume von oben*').[1] That is to say, they are formulations of ideas which could have been created just as well in a waking state as during the state of sleep, and which have derived their content only in certain parts from mental states at a comparatively deep level. That is why these dreams offer for the most part a content which has an abstract, poetic or symbolic form.

The analysis of dreams of this kind usually leads us to the following position: we cannot understand the dream, but the dreamer – or the patient – can translate it immediately and without difficulty, given that the content of the dream is very close to his conscious thoughts. There then remain certain parts of the dream about which the dreamer does not know what to say: and these are precisely the parts which belong to the unconscious and which are in many respects the most interesting.

In the most favourable cases we explain this unconscious [part] with the help of the ideas which the dreamer has added to it.

This way of judging 'dreams from above' – and this term must be understood in a psychological, not in a mystical, sense – is the one to be followed in the case of Descartes' dreams.

The philosopher interprets them himself and, in accordance with all [204]
the rules for the interpretation of dreams, we must accept his

1 [Cf. Section III of 'The Theory and Practice of Dream Interpretation' (1923*c*), *RSE*, **19**, 101.]

explanation, but it should be added that we have no path open to us which will take us any further.

In confirmation of his explanation we can say that the hindrances which prevented him from moving freely are perfectly well known to us: they are a representation by the dream of an internal conflict. The left side represents evil and sin, and the wind the 'evil genius' (*animus*).

The different figures who appear in the dream cannot of course be identified by us, although Descartes, if he were questioned, would not have failed to identify them. The bizarre elements, of which, incidentally, there are few, and which are almost absurd – such as 'the melon from a foreign land', and the little portraits – remain unexplained.

As regards the melon, the dreamer has had the – original – idea of seeing in it 'the charms of solitude, but presented by purely human inducements'. This is certainly not correct, but it might provide an association of ideas which would lead to a correct explanation. If it is correlated with his state of sin, this association might stand for a sexual picture which occupied the lonely young man's imagination.

On the question of the portraits Descartes throws no light.

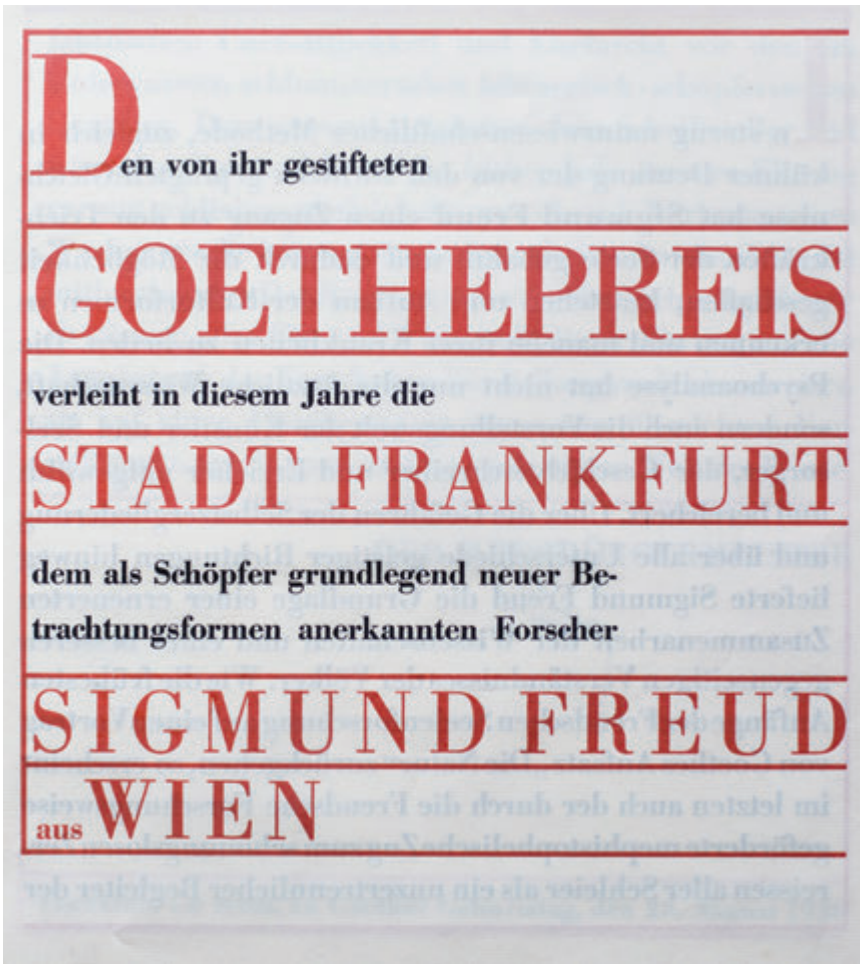
The present translation is a very slightly revised reprint of the *SE* version.

In 1927 the City of Frankfurt founded the 'Goethe Prize', which was to be awarded annually to 'a personality of established achievement whose creative work is worthy of an honour dedicated to Goethe's memory'. The first three awards were made to Stefan George, the poet, Albert Schweitzer, the musician and medical missionary, and Leopold Ziegler, the philosophical writer. The amount of the prize was 10,000 Reichsmark.

At the suggestion of Alfons Paquet, a well-known man of letters who was Secretary to the Trustees of the Fund, it was decided to award the 1930 prize to Freud. This was announced to Freud (who was on holiday at the time in the

Salzkammergut) in a letter from Paquet dated July 26, 1930 (printed in the *Psychoanalytische Bewegung*, **2**, 417–18), to which Freud replied on August 3.[1] It was the practice, as Paquet explained in his letter, for the prize to be presented each year on August 28 at a ceremony in the house in Frankfurt where Goethe was born, and for the recipient to give an address there, illustrating his own inner relation to Goethe. Owing to his illness, Freud was unable to do this himself, but the address which he prepared was read by Anna Freud at the ceremony in the Goethe House on August 28.

1 The date is given as August 5 in the two later German editions.



Goethe Prize, 1930

Goethe Prize, 1930

It reads: 'The GOETHE PRIZE / endowed by the / CITY OF FRANKFURT / is awarded this year to the researcher recognized as the creator of fundamentally new perspectives / SIGMUND FREUD / of VIENNA.' In the Postscript to his *Autobiographical Study*, Freud wrote: 'This was the climax of my life as a citizen.' (*RSE*, **20**, 65.)

LETTER TO DR ALFONS PAQUET

Grundlsee, 3.8.1930 [207]

My dear Dr Paquet,

I have not been spoilt by public marks of honour and I have so adapted myself to this state of things that I have been able to do without them. I should not like to deny, however, that the award of the Goethe Prize of the City of Frankfurt has given me great pleasure. There is something about it that especially fires the imagination [*Phantasie*][T] and one of its stipulations dispels the feeling of humiliation which in other cases is a concomitant of such distinctions.

I must particularly thank you for your letter; it moved and astonished me. Apart from your sympathetic penetration into the nature of my work, I have never before found the secret, personal intentions behind it recognized with such clarity as by you, and I should very much like to ask you how you come by such knowledge.

I am sorry to learn from your letter to my daughter that I am not to see you in the near future, and postponement is always a chancy affair at my time of life. Of course, I shall be most ready to receive the gentleman (Dr Michel) whose visit you announce.

Unfortunately, I shall not be able to attend the ceremony in Frankfurt; I am too frail for such an undertaking. The company there will lose nothing by that: my daughter Anna is certainly pleasanter to look at and to listen to than I am. We propose that she shall read out a few sentences of mine which deal with Goethe's connections with psychoanalysis and defend the analysts themselves against the reproach of having offended against the respect due to the great man by the analytic attempts they have made on him. I hope it will be acceptable if I thus adapt the theme that has been proposed to me – my 'inner relations as a man and a scientist to Goethe' – or else that you will be kind enough to let me know.

Yours very sincerely,
Freud

ADDRESS DELIVERED IN THE GOETHE HOUSE AT FRANKFURT

[208] My life's work has been directed to a single aim. I have observed the
Seele more subtle disturbances of mental [*seelischen*]^{T} function in healthy and sick people and have sought to infer – or, if you prefer it, to guess [*erraten*]^{T} – from signs of this kind how the apparatus which serves these
Gebäude functions is constructed [*gebaut*]^{T} and what concurrent and mutually opposing forces [*Kräfte*]^{T} are at work in it. What we – I, my friends and collaborators – have managed to learn in following this path has seemed to us of importance for the construction of a mental science which makes it possible to understand both normal and pathological processes as parts of the same natural course of events.

I was recalled from such narrow considerations by the astonishing honour which you do me. By evoking the figure of the great universal personality who was born in this house and who spent his childhood in these rooms, your distinction prompts one, as it were, to justify oneself before him and raises the question of how *he* would have reacted if his glance, attentive to every innovation in science, had fallen on psychoanalysis.

Goethe can be compared in versatility to Leonardo da Vinci, the Renaissance master, who, like him, was both artist and scientific investigator. But human images can never be repeated, and profound differences between the two great men are not lacking. In Leonardo's nature the scientist did not harmonize with the artist, he interfered with him and perhaps in the end stifled him. In Goethe's life both personalities found room side by side: at different times each allowed the other to predominate. In Leonardo it is plausible to associate his disturbance with that inhibition in his development which withdrew everything erotic, and hence psychology too, from his sphere of interest. In this respect Goethe's character was able to develop more freely.

I think that Goethe would not have rejected psychoanalysis in an unfriendly spirit, as so many of our contemporaries have done. He himself approached it at a number of points, recognized much through

his own insight that we have since been able to confirm, and some views [*Auffassungen*][T], which have brought criticism and mockery down upon us, were expounded by him as self-evident. Thus he was familiar with the incomparable strength of the first affective ties of human creatures. He celebrated them in the Dedication to his *Faust* poem, in words which we could repeat for each of our analyses: [209]

> Ihr naht euch wieder, schwankende Gestalten,
> Die früh sich einst dem trüben Blick gezeigt.
> Versuch' ich wohl, euch diesmal festzuhalten?
> . . . . . .
>
> Gleich einer alten, halbverklungenen Sage
> Kommt erste Lieb' und Freundschaft mit herauf.[1]

He explained to himself the strongest impulse of love that he experienced as a mature man by apostrophizing his beloved: 'Ach, du warst in abgelebten Zeiten meine Schwester oder meine Frau.'[2]

Thus he does not deny that these perennial first inclinations take figures from one's own family circle as their object.

Goethe paraphrases the content of dream life in the evocative words:

> Was von Menschen nicht gewusst
> Oder nicht bedacht,
> Durch das Labyrinth der Brust
> Wandelt in der Nacht.[3]

Behind this magic we recognize the ancient, venerable and incontestably correct pronouncement of Aristotle – that dreaming is the continuation of our mental activity into the state of sleep – combined with the recognition of the unconscious which psychoanalysis first added to it. Only the riddle of dream distortion finds no solution here.

In what is perhaps his most sublime poetical creation, *Iphigenie*, [210]

1 [Again ye come, ye hovering forms! I find ye,
As early to my clouded sight ye shone!
Shall I attempt, this once, to seize and bind ye?
. . . . . .
And, like an old and half-extinct tradition,
First love returns, with friendship in his train.
From the opening lines of the Dedication to *Faust*, in Bayard Taylor's translation.]

2 ['Ah, you were, in a past life, my sister or my wife.' From a poem to Charlotte von Stein, 'Warum gabst du uns die tiefen Blicke'.]

3 ['That which, not known or not heeded by men, wanders in the night through the labyrinth of the heart.' From the final version of the poem 'An den Mond', which begins: 'Füllest wieder Busch und Tal'.]

Goethe shows us a striking instance of expiation, of the freeing of a suffering mind from the burden of guilt, and he makes this catharsis come about through a passionate outburst of feeling under the beneficent influence of loving sympathy. Indeed, he himself repeatedly made attempts at giving psychological help – as, for example, to the unfortunate man who is named as Kraft in the Letters, and to Professor Plessing, of whom he tells in the *Campagne in Frankreich* [*Campaign in France*]; and the procedure which he applied goes beyond the method of the Catholic confessional and approximates in some remarkable details to the technique of our psychoanalysis. There is an example of psychotherapeutic influence which is described by Goethe as a jest, but which I should like to quote in full since it may not be well known and yet is very characteristic. It is from a letter to Frau von Stein (No. 1444, of September 5, 1785):

'Yesterday evening I performed a psychological feat. Frau Herder was still in a state of tension of the most hypochondriacal kind over all the unpleasant things that had happened to her at Carlsbad. Particularly through the woman who was her companion in the house. I made her tell and confess everything to me, other people's misdeeds and her own faults with their most minute circumstances and consequences, and at the end I absolved her and made it clear to her, jestingly, in this formula, that these things were now done with and cast into the depths of the sea. She herself made fun of it all and is really cured.'

Goethe always rated Eros high, never tried to belittle its power, followed its primitive and even wanton expressions with no less attentiveness than its highly sublimated ones and has, as it seems to me, expounded its essential unity throughout all its manifestations no less decisively than Plato did in the remote past. Indeed, it is perhaps more than a chance coincidence when, in *Die Wahlverwandtschaften* [*The Elective Affinities*], he applies to love an idea taken from the sphere of chemistry – a connection to which the name of psychoanalysis itself bears witness.

I am prepared for the reproach that we analysts have forfeited the right to place ourselves under the patronage of Goethe because we have
[211] offended against the respect due to him by trying to apply analysis to him himself: we have degraded the great man to the position of an object of analytic investigation. But I would dispute at once that any degradation is intended or implied by this.

We all, who revere Goethe, put up, without too much protest, with the efforts of his biographers, who try to recreate his life from existing accounts and indications. But what can these biographies achieve for us? Even the best and fullest of them could not answer the two questions which alone seem worth knowing about. It would not throw any light on the riddle of the miraculous gift that makes an artist, and it could not help us to comprehend any better the value and the effect of his works. And yet there is no doubt that such a biography does satisfy a powerful need in us. We feel this very distinctly if the legacy of history unkindly refuses the satisfaction of this need – for example in the case of Shakespeare. It is undeniably painful to all of us that even now we do not know who was the author of the comedies, tragedies and sonnets of Shakespeare; whether it was, in fact, the untutored son of the provincial citizen of Stratford, who attained a modest position as an actor in London, or whether it was, rather, the nobly born and highly cultivated, passionately wayward, to some extent *déclassé* aristocrat, Edward de Vere, seventeenth Earl of Oxford, hereditary Lord Great Chamberlain of England.[1] But how can we justify a need of this kind to obtain knowledge of the circumstances of a man's life when his works have become so full of importance to us? People generally say that it is our desire to bring ourselves nearer to such a man in a human way as well. Let us grant this; it is, then, the need to acquire affective relations with such men, to add them to the fathers, teachers, exemplars whom we have known or whose influence we have already experienced, in the expectation that their personalities will be just as fine and admirable as those works of art of theirs which we possess.

All the same, we may admit that there is still another motive [*Motiv*][T] at work. The biographer's justification also contains a confession. It is true that the biographer does not want to depose his hero, but he does [212] want to bring him nearer to us. That means, however, reducing the distance that separates him from us: it still tends in effect towards degradation. And it is unavoidable that if we learn more about a great man's life we shall also hear of occasions on which he has in fact done no better than we, has in fact come near to us as a human being. Nevertheless, I think we may declare the efforts of biography to be legitimate. Our attitude to fathers and teachers is, after all, an ambivalent one, since our

1 [This was Freud's first published expression in detail of his views on the authorship of Shakespeare's works. He returned to the question in a footnote added in 1935 to Chapter VI of his *Autobiographical Study* (1925*d*), *RSE*, **20**, 55–6 *n.*, and again in Part II of his posthumous *Outline* (1940*a* [1938]), ibid., **23**, 173 *n.* 1, where further references are given in an editorial addition.]

reverence for them regularly conceals a component of hostile rebellion. That is a psychological fatality; it cannot be altered without forcible suppression of the truth and is bound to extend to our relations with the great men whose life histories we wish to investigate.[1]

When psychoanalysis puts itself at the service of biography, it naturally has the right to be treated no more harshly than the latter itself. Psychoanalysis can supply some information which cannot be arrived at by other means, and can thus demonstrate new connecting threads in the 'weaver's masterpiece'[2] spread between the drive endowments [*Triebanlagen*][T], the experiences and the works of an artist. Since it is one of the principal functions of our thinking to master the material of the external world psychically, it seems to me that thanks are due to psychoanalysis if, when it is applied to a great man, it contributes to the understanding of his great achievement. But, I admit, in the case of Goethe we have not yet succeeded very far. This is because Goethe was not only, as a poet, a great self-revealer, but also, in spite of the abundance of autobiographical records, a careful concealer. We cannot help thinking here of the words of Mephistopheles:

Trieb

> Das Beste, was du wissen kannst,
> Darfst du den Buben doch nicht sagen.[3]

1 [Freud had made some remarks on the relation of psychoanalysis to biography in his essay on Leonardo (1910*c*), *RSE*, **11**, 121–2. He had also discussed the question at a meeting of the Vienna Psychoanalytical Society on December 11, 1907. (Cf. Jones, 1955, 383.)]

2 [A quotation from Mephistopheles's description of the fabric of thought, in *Faust*, Part I, Scene 4. Freud had quoted the whole passage, in connection with the complexity of dream associations, in Chapter VI (A) of *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 252.]

3 [The best of what you know may not, after all, be told to boys.
(*Faust*, Part I, Scene 4.)
Freud had often quoted these lines. For other instances see *The Interpretation of Dreams* (1900*a*), ibid., **4**, 126 *n*. 1.]

APPENDIX

LIST OF WRITINGS BY FREUD DEALING MAINLY OR LARGELY WITH ART, LITERATURE OR THE THEORY OF AESTHETICS

The date at the beginning of each entry is that of the year during which the work in question was probably written. The date at the end is that of publication, and under that date fuller particulars of the work can be found in the Bibliography. The items in square brackets were published posthumously. [213]

[1897	On *Oedipus Rex* and *Hamlet* in Letter 71 to Fliess of October 15, 1897. (1950*a*)]
[1898	'Die Richterin' ('The Woman Judge'), in Letter 91 to Fliess of June 20, 1898. (1950*a*)]
1899	*The Interpretation of Dreams*, Chapter V, Section D (*β*), on *Oedipus Rex* and *Hamlet*. (1900*a*)
1905	*Jokes and their Relation to the Unconscious.* (1905*c*)
[1905–06	'Psychopathic Characters on the Stage.' (1942*a*)]
1906	*Delusions and Dreams in Jensen's 'Gradiva'.* (1907*a*)
1906	'Contribution to a Questionnaire on Reading.' (1906*f*)
1907	'Creative Writers and Daydreaming.' (1908*e*)
1910	*Leonardo da Vinci and a Memory of his Childhood.* (1910*c*)
1913	'The Theme of the Three Caskets.' (1913*f*)
1913	'The Claims of Psychoanalysis to Scientific Interest', Part II, Section F. (1913*j*)
1914	'The Moses of Michelangelo.' (1914*b*)
1915	'On Transience.' (1916*a*)
1916	'Some Character-Types Met with in Psychoanalytic Work.' (1916*d*)
1917	'A Childhood Recollection from *Dichtung und Wahrheit*.' (1917*b*)
1919	'The "Uncanny".' (1919*h*)
1927	Postscript to 'The Moses of Michelangelo'. (1927*b*)
1927	'Humour.' (1927*d*)
1927	'Dostoevsky and Parricide.' (1928*b*)
1929	Letter to Reik on Dostoevsky. (1930*f*) [214]
1930	'The Goethe Prize.' (1930*d* and *e*)
1933	Preface to Marie Bonaparte's *Edgar Allan Poe.* (1933*d*)

LIBIDINAL TYPES

The present translation is a revised reprint of the *SE* version.

Like the next paper ('Female Sexuality'), this was begun early in 1931 and finished during the summer. It is a late addition to the very small number of Freud's papers dealing with characterology. Though the topic crops up in a number of his writings (for instance, in the first half of Chapter III of *The Ego and the Id* (1923*b*), *RSE*, **19**, 24 ff.), only two of his previous works had been explicitly concerned with it: 'Character and Anal Erotism' (1908*b*), ibid., **9**, and 'Some Character-Types Met with in Psychoanalytic Work' (1916*d*), ibid., **14**. In the present work the subject is considered in the light of Freud's later, structural, view of the mind. – It may be remarked that the taxonomic differentiation of 'types', with all the methodological problems it entails (which Freud touches on at the start of this paper), harks back to a major preoccupation of the great nosographer Charcot, who made such a deep impression on the young Freud (see Freud, 1893*f*; *NSW*, **4**; *RSE*, **3**, 11 ff.).

LIBIDINAL TYPES

Observation teaches us that individual human beings realize the general picture of humanity in an almost infinite variety of ways. If we yield to the legitimate need to distinguish particular types in this multiplicity, we shall at the start have the choice as to what characteristics and what points of view we shall take as the basis of our differentiation. For that purpose somatic qualities will doubtless serve no less well than psychical ones; the most valuable distinctions will be those which promise to present a regular combination of somatic and mental [*seelischen*][T] characteristics. [217] *Seele*

It is doubtful whether we are as yet in a position to discover types to fulfil this requirement – as we shall no doubt be able to do later, on some basis of which we are still ignorant. If we confine our effort to setting up purely psychological types, the libidinal situation will have a first claim to serve as a basis for our classification. It may fairly be demanded that this classification should not merely be deduced from our knowledge or our hypotheses about the libido, but that it should be easily confirmed in actual experience and that it should contribute to the clarification of the mass of our observations and help us to grasp them. It may at once be admitted that these libidinal types need not be the only possible ones even in the psychical field, and that, if we proceeded from other qualities, we might perhaps establish a whole set of other psychological types. But it must be required of all such types that they shall not coincide with clinical pictures. On the contrary, they must comprehend all the variations which according to our practical judgement fall within the limits of the normal. In their extreme developments [*Ausbildungen*], however, they may well approximate to clinical pictures and in that way help to bridge the gulf that is supposed to lie between the normal and the pathological.

According, then, as the libido is predominantly allocated to the provinces of the mental apparatus, we can distinguish three main libidinal types. To give names to these types is not particularly easy; following

[*in Anlehnung an*]^{T} the lines of our depth psychology, I should like to call them the *erotic*, the *narcissistic* and the *obsessional* types.[1]

[218] The *erotic* type is easily characterized. Erotics are those whose main interest – the relatively largest part of whose libido – is turned towards love. Loving, but above all being loved, is the most important thing for them. They are dominated by the fear [*Angst*]^{T} of loss of love and are therefore especially dependent on others who may withhold their love from them. Even in its pure form this type is a very common one. Variants of it occur according as it is blended with another type and in proportion to the amount of aggressiveness present in it. From the social and cultural standpoint this type represents the elementary drive
Trieb demands [*Triebansprüche*]^{T} of the id [*Es*]^{T}, to which the other psychical agencies have become compliant.

The second type is what I have termed the *obsessional* type – a name which may at first seem strange. It is distinguished by the predominance of the superego [*Über-Ichs*]^{T}, which is separated from the ego [*Ich*]^{T} under great tension. People of this type are dominated by fear of their conscience [*Gewissensangst*] instead of fear of losing love. They exhibit, as it were, an internal instead of an external dependence. They develop a high degree of self-reliance; and, from the social standpoint, they are the true, pre-eminently conservative vehicles of civilization[2] [*Kultur*]^{T}.

The third type, justly called the *narcissistic* type, is mainly to be described in negative terms. There is no tension between ego and superego (indeed, on the strength of this type one would scarcely have arrived at the hypothesis of a superego), and there is no preponderance of erotic needs. The subject's main interest is directed to self-preservation [*Selbsterhaltung*]^{T}; he is independent and not open to intimidation. His ego has a large amount of aggressiveness at its disposal, which also manifests itself in readiness for activity. In his erotic life loving is preferred above being loved. People belonging to this type impress others as being 'personalities'; they are especially suited to act as a support for others, to take on the role of leaders and to give a fresh stimulus to cultural development or to damage the established state of affairs.

These pure types will hardly escape the suspicion of having been deduced from the theory of the libido. But we feel ourselves on the firm ground of experience when we turn to the mixed types, which are to be

1 [Freud had approached this classification of types in Chapter II of *Civilization and its Discontents* (1930*a*), p. 77 above.]

2 [Cf. Chapter II of *The Future of an Illusion* (1927*c*), p. 11 above.]

observed so much more frequently than the unmixed ones.[1] These new types – the *erotic-obsessional*, the *erotic-narcissistic* and the *narcissistic-obsessional* – seem, in fact, to afford a good classification of the individual psychical structures which we have come to know through analysis. If we study these mixed types we find in them pictures of characters with which we have long been familiar. In the *erotic-obsessional* type it appears that the preponderance of the life of the drives is restricted by the influence of the superego. In this type, dependence at once on contemporary human objects and on the residues of parents, educators and exemplars is carried to its highest pitch. The *erotic-narcissistic* type is perhaps the one we must regard as the commonest of all. It unites opposites, which are able to moderate one another in it. One may learn from this type, as compared with the two other erotic ones, that aggressiveness and activity go along with a predominance of narcissism. Finally, the *narcissistic-obsessional* type produces the variation which is most valuable from a cultural [*kulturell*] standpoint; for it adds to independence of the external world and a regard for the demands of conscience a capacity for vigorous action, and it strengthens the ego against the superego. [219]

One might think one was making a jest if one asked why no mention has been made here of another mixed type which is theoretically possible – namely, the *erotic-obsessional-narcissistic* type. But the answer to this jest is serious. Such a type would no longer be a type at all: it would be the absolute norm, the ideal harmony. We thus realize that the phenomenon of types arises precisely from the fact that, of the three main ways of employing the libido in the economy of the mind, one or two have been favoured at the expense of the others.

The question may also be raised of what the relation is of these libidinal types to pathology – whether some of them have a special disposition to pass over into neurosis, and if so, which types lead to which forms of neurosis. The answer is that the setting up of these libidinal types throws no new light on the genesis of the neuroses. Experience shows that all these types can exist without any neurosis. The pure types, marked by the undisputed preponderance of a single mental agency, seem to have a better chance of manifesting themselves as pure characterological pictures, while we might expect that mixed types would provide a more favourable soil for conditions leading to a neurosis. But I think we should not make up our minds on these matters till they have been submitted to a careful and specially directed examination. [220]

1 [Cf. Charcot's '*formes frustes*' (Freud, 1893*f*; *NSW*, **4**; *RSE*, **3**, 12).]

It seems easy to infer that when people of the erotic type fall ill they will develop hysteria, just as those of the obsessional type will develop obsessional neurosis; but these inferences, too, share the uncertainty which I have just stressed. People of the narcissistic type who are exposed to a frustration [*Versagung*][T] from the external world, though otherwise independent, are peculiarly disposed to psychosis; and they also present essential preconditions for criminality.

It is a familiar fact that the aetiological preconditions of neurosis are not yet known with certainty. The precipitating causes of it are frustrations and internal conflicts: conflicts between the three major psychical agencies, conflicts arising within the libidinal economy in consequence of our bisexual disposition and conflicts between the erotic and the aggressive drive components. It is the endeavour of the psychology of the neuroses to discover what makes these processes, which belong to the normal course of mental life, become pathogenic.

The present translation is a revised and corrected reprint of the *SE* version.

The first draft of this paper seems to have been written by the end of February, 1931, but it was only completed in the summer of that year (Jones, 1957, 176).

The present study is in essence a restatement of the findings first announced by Freud six years earlier in his paper on 'Some Psychical Consequences of the Anatomical Distinction between the Sexes' (1925*j*), some discussion of which can be found in an Editors' Note to that work, *RSE*, **19**, 245. The publication of this earlier work provoked considerable repercussions among psychoanalysts, especially, perhaps, in England, and these may have stimulated Freud to return to the subject. The last section of the present paper contains – and this was a very unusual thing in Freud's writings – some criticisms of a number of papers by other authors. And it is a curious thing that he seems to treat them as though these papers had arisen spontaneously and not, as was clearly the case, as a reaction to his own somewhat revolutionary paper of 1925 – to which, indeed, he here makes no reference whatever.

[224] There are, however, one or two respects in which this work enlarges upon its predecessor. It lays further emphasis (evidently on the basis of fresh clinical material) on the intensity and long duration of the little girl's pre-Oedipus attachment to her mother. But of most interest, perhaps, is the long discussion of the *active* element in the little girl's attitude towards her mother and in femininity in general.

A year or so after the appearance of this paper Freud returned to the question of female sexuality in Lecture XXXIII of the *New Introductory Lectures* (1933*a*), *RSE*, **22**. This deals with the subject on very similar lines to the present ones, though in a rather less technical manner; it ends, moreover, with some discussion of the characteristics of women in adult life.

FEMALE SEXUALITY

I

During the phase of the normal Oedipus complex we find the child tenderly attached [*gebunden*] to the parent of the opposite sex [*gegengeschlechtlichen*][T], while its relation to the parent of its own sex is predominantly hostile. In the case of a boy there is no difficulty in explaining this. His first love object was his mother. She remains so; and, with the strengthening of his erotic desires and his deeper insight into the relations between his father and mother, the former is bound to become his rival. With the small girl it is different. Her first object, too, was her mother. How does she find her way to her father? How, when and why does she detach herself from her mother? We have long understood that the development of female sexuality is complicated by the fact that the girl has the task of giving up what was originally her leading genital zone – the clitoris – in favour of a new zone – the vagina.[1] But it now seems to us that there is a second change of the same sort which is no less characteristic and important for the development of the female: the exchange of her original object – her mother – for her father. The way in which the two tasks are connected with each other is not yet clear to us. [225] *Geschlecht*

It is well known that there are many women who have a strong attachment to their father; nor need they be in any way neurotic. It is upon such women that I have made the observations which I propose to report here and which have led me to adopt a particular view of female sexuality. I was struck, above all, by two facts. The first was that where the woman's attachment to her father was particularly intense, analysis showed that it had been preceded by a phase of exclusive attachment to her mother which had been equally intense and passionate. Except for the change of her love object, the second phase had scarcely

1 [*Three Essays on the Theory of Sexuality* (1905*d*), *RSE*, 7, 194–5. But the point had already been made in a letter to Fliess of November 14, 1897 (Freud, 1950*a*, Letter 75).]

added any new feature to her erotic life. Her primary relation to her mother had been built up in a very rich and many-sided manner. The
[226] second fact taught me that the *duration* of this attachment had also been greatly underestimated. In several cases it lasted until well into the fourth year – in one case into the fifth year – so that it covered by far the longer part of the period of early sexual [*sexuellen*] efflorescence. Indeed, we had to reckon with the possibility that a number of women remain arrested in their original attachment to their mother and never achieve a true changeover towards men. This being so, the pre-Oedipus phase in women gains an importance which we have not attributed to it hitherto.

Since this phase allows room for all the fixations and repressions [*Verdrängungen*][T] from which we trace the origin of the neuroses, it would seem as though we must retract the universality of the thesis that the Oedipus complex is the nucleus of the neuroses. But if anyone feels reluctant about making this correction, there is no need for him to do so. On the one hand, we can extend the content of the Oedipus complex to include all the child's relations to both parents; or, on the other, we can take due account of our new findings by saying that the female only reaches the normal positive Oedipus situation after she has surmounted a period before it that is governed by the negative complex.[1] And indeed during that phase a little girl's father is not much else for her than a troublesome rival, although her hostility towards him never reaches the pitch which is characteristic of boys. We have, after all, long given up any expectation of a neat parallelism between male and female sexual development.

Our insight into this early, pre-Oedipus, phase in girls comes to us as a surprise, like the discovery, in another field, of the Minoan-Mycenaean civilization [*Kultur*][T] behind the civilization of Greece.

Everything in the sphere of this first attachment to the mother seemed to me so difficult to grasp in analysis – so grey with age and shadowy and almost impossible to revivify – that it was as if it had succumbed to an especially inexorable repression. But perhaps I gained this impression because the women who were in analysis with me were able to cling to the very attachment to the father in which they had taken refuge from the early phase that was in question. It does indeed appear that women
[227] analysts – as, for instance, Jeanne Lampl-de Groot and Helene Deutsch – have been able to perceive these facts more easily and clearly because

1 [The positive and negative Oedipus complexes were discussed by Freud in Chapter III of *The Ego and the Id* (1923*b*), *RSE*, **19**, 28–9.]

they were helped in dealing with those under their treatment by the transference [*Übertragung*][T] to a suitable mother substitute. Nor have I succeeded in seeing my way through any case completely, and I shall therefore confine myself to reporting the most general findings and shall give only a few examples of the new ideas [*Einsichten*] which I have arrived at. Among these is a suspicion that this phase of attachment to the mother is especially intimately related to the aetiology of hysteria, which is not surprising when we reflect that both the phase and the neurosis are characteristically feminine, and further, that in this dependence on the mother we have the germ of later paranoia in women.[1] For this germ appears to be the surprising, yet regular, fear [*Angst*][T] of being killed (? devoured) by the mother. It is plausible to assume that this fear corresponds to a hostility which develops in the child towards her mother in consequence of the manifold restrictions imposed by the latter in the course of training and bodily care and that the mechanism of projection is favoured by the early age of the child's psychical organization.[2]

II

I began by stating the two facts which have struck me as new: that a woman's strong dependence on her father merely takes over the heritage of an equally strong attachment to her mother, and that this earlier phase has lasted for an unexpectedly long period of time. I shall now go back a little in order to insert these new findings into the picture of female sexual development [*Sexualentwicklung*] with which we are familiar. In doing this, a certain amount of repetition will be inevitable. It will help our exposition if, as we go along, we compare the state of things in women with that in men.

First of all, there can be no doubt that the bisexuality, which is present, as we believe, in the innate disposition of human beings, comes to [228] the fore much more clearly in women than in men. A man, after all, has only one leading sexual zone [*Geschlechtszone*], one sexual organ, whereas a woman has two: the vagina – the female organ proper – and the clitoris, which is analogous to the male organ. We believe we are justified in assuming that for many years the vagina is virtually

1 In the well-known case of delusional jealousy reported by Ruth Mack Brunswick (1928*b*), the direct source of the disorder was the patient's pre-Oedipus fixation (to her sister). [Cf. also Freud's own 'Case of Paranoia Running Counter to the Psychoanalytic Theory of the Disease' (1915*f*), *RSE*, **14**, 261 ff.]

2 [The girl's fear of being killed by her mother is discussed further below on p. 226.]

non-existent and possibly does not produce sensations until puberty. It is true that recently an increasing number of observers report that vaginal impulses [*Regungen*][T] are present even in these early years. In women, therefore, the main genital occurrences of childhood must take place in relation to the clitoris. Their sexual life [*Geschlechtsleben*] is regularly divided into two phases, of which the first has a masculine character, while only the second is specifically feminine. Thus in female development there is a process of transition from the one phase to the other, to which there is nothing analogous in the male. A further complication arises from the fact that the clitoris, with its virile character, continues to function in later female sexual life in a manner which is very variable and which is certainly not yet satisfactorily understood. We do not, of course, know the biological basis of these peculiarities in women; and still less are we able to assign them any teleological purpose.

Parallel with this first great difference there is the other, concerned with the finding of the object. In the case of a male, his mother becomes his first love object as a result of her feeding him and looking after him, and she remains so until she is replaced by someone who resembles her or is derived from her. A female's first object, too, must be her mother: the primary conditions for a choice of object are, of course, the same for all children. But at the end of her development, her father – a man – should have become her new love object. In other words, to the change in her own sex there must correspond a change in the sex of her object. The new problems that now require investigating are in what way this change takes place, how radically or how incompletely it is carried out, and what the different possibilities are which present themselves in the course of this development.

We have already learnt, too, that there is yet another difference between the sexes, which relates to the Oedipus complex. We have an impression here that what we have said about the Oedipus complex
[229] applies with complete strictness to the male child only and that we are right in rejecting the term 'Electra complex'[1] which seeks to emphasize the analogy between the attitude of the two sexes. It is only in the male child that we find the fateful combination of love for the one parent and simultaneous hatred for the other as a rival. In his case it is the discovery of the possibility of castration, as proved by the sight of the female

1 [See 'The Psychogenesis of a Case of Homosexuality in a Woman' (1920*a*), *RSE*, **18**, 146 *n*. 2. The term had been used by Jung in his 'Versuch einer Darstellung der psychoanalytischen Theorie' (1913, 370).]

genitals, which forces on him the transformation of his Oedipus complex, and which leads to the creation of his superego [*Über-Ichs*]^{T} and thus initiates all the processes that are designed to make the individual find a place in the cultural community. After the paternal agency has been internalized and become a superego, the next task is to detach the latter from the figures of whom it was originally the mental [*seelisch*]^{T} representative. In this remarkable course of development it is precisely the boy's narcissistic interest in his genitals – his interest in preserving his penis – which is turned round into a curtailing of his infantile sexuality [*Sexualität*].[1]

One thing that is left over in men from the influence of the Oedipus complex is a certain amount of disparagement in their attitude towards women, whom they regard as being castrated. In extreme cases this gives rise to an inhibition [*Hemmung*]^{T} in their choice of object, and, if it is supported by organic factors, to exclusive homosexuality.

Quite different are the effects of the castration complex in the female. She acknowledges the fact of her castration, and with it, too, the superiority of the male and her own inferiority; but she rebels against this unwelcome state of affairs. From this divided attitude three lines of development open up. The first leads to a general revulsion from sexuality. The little girl, frightened by the comparison with boys, grows dissatisfied with her clitoris, and gives up her phallic activity and with it her sexuality in general as well as a good part of her masculinity in other fields. The second line leads her to cling with defiant self-assertiveness to her threatened masculinity. To an incredibly late age she clings to the hope of getting a penis some time. That hope becomes her [230]
life's aim; and the phantasy [*Phantasie*]^{T} of being a man in spite of everything often persists as a formative factor over long periods. This 'masculinity complex' in women can also result in a manifest homosexual choice of object. Only if her development follows the third, very circuitous, path does she reach the final normal female attitude, in which she takes her father as her object and so finds her way to the feminine form of the Oedipus complex. Thus in women the Oedipus complex is the end result of a fairly lengthy development. It is not destroyed [*zerstört*], but created, by the influence of castration; it escapes the strongly hostile influences which, in the male, have a destructive effect on it, and indeed it is all too often not surmounted by the female at all. For this reason, too, the cultural consequences of its break-up are smaller and of less importance in her. We should probably not be wrong

1 [For all of this see 'The Dissolution of the Oedipus Complex' (1924*d*), *RSE*, **19**, 167.]

in saying that it is this difference in the reciprocal relation between the Oedipus and the castration complex which gives its special stamp to the character of females as social beings.[1]

We see, then, that the phase of exclusive attachment to the mother, which may be called the *pre-Oedipus* phase, possesses a far greater importance in women than it can have in men. Many phenomena of female sexual life which were not properly understood before can be fully explained by reference to this phase. Long ago, for instance, we noticed that many women who have chosen their husband on the model of their father, or have put him in their father's place, nevertheless repeat towards him, in their married life, their bad relations with their
[231] mother.[2] The husband of such a woman was meant to be the inheritor of her relation to her father, but in reality he became the inheritor of her relation to her mother. This is easily explained as an obvious case of regression. Her relation to her mother was the original one, and her attachment to her father was built up on it, and now, in marriage, the original relation emerges from repression. For the main content of her development to womanhood lay in the carrying over [*Überschreibung*] of her affective object attachments from her mother to her father.

With many women we have the impression that their years of maturity are occupied by a struggle with their husband, just as their youth was spent in a struggle with their mother. In the light of the previous discussions we shall conclude that their hostile attitude to their mother is not a consequence of the rivalry implicit in the Oedipus complex, but originates from the preceding phase and has merely been reinforced and exploited in the Oedipus situation. And actual analytic examination confirms this view. Our interest must be directed to the mechanisms that are at work in her turning away from the mother who was an object so intensely and exclusively loved. We are prepared to find, not a single

1 It is to be anticipated that men analysts with feminist views, as well as our women analysts, will disagree with what I have said here. They will hardly fail to object that such notions spring from the 'masculinity complex' of the male and are designed to justify on theoretical grounds his innate inclination to disparage and suppress women. But this sort of psychoanalytic argumentation reminds us here, as it so often does, of Dostoevsky's famous 'knife that cuts both ways'. The opponents of those who argue in this way will on their side think it quite natural that the female sex should refuse to accept a view which appears to contradict their eagerly coveted equality with men. The use of analysis as a weapon of controversy can clearly lead to no decision. – [The Dostoevsky phrase (a simile applied to psychology) occurs in the speech for the defence in the account of Mitya's trial in Chapter X of Book XII of *The Brothers Karamazov*. Freud had quoted it already in his paper on 'Dostoevsky and Parricide' (1928*b*), p. 176 above. The actual simile used by Freud and in the Russian original is 'a stick with two ends'.]

2 [See 'The Taboo of Virginity' (1918*a*), *RSE*, **11**, 193 ff.]

factor, but a whole number of them operating together towards the same end.

Among these factors are some which are determined by the circumstances of infantile sexuality in general, and so hold good equally for the erotic life of boys. First and foremost we may mention jealousy of other people – of brothers and sisters, rivals, among whom the father too has a place. Childhood love is boundless; it demands exclusive possession, it is not content with less than all. But it has a second characteristic: it has, in point of fact, no aim and is incapable of obtaining complete satisfaction; and principally for that reason it is doomed to end in disappointment[1] and to give place to a hostile attitude. Later on in life the lack of an ultimate satisfaction may favour a different result. This very factor may ensure the uninterrupted continuance of the libidinal cathexis [*Libidobesetzung*][T], as happens with love relations that are inhibited in their aim. But in the stress of the processes of development it regularly happens that the libido abandons its unsatisfying position in order to find a new one. *Besetzung*

Another, much more specific motive [*Motiv*][T] for turning away from the mother arises from the effect of the castration complex on the creature who is without a penis. At some time or other the little girl makes the discovery of her organic inferiority – earlier and more easily, of course, if there are brothers or other boys about. We have already taken note of the three paths which diverge from this point: (*a*) the one which leads to a cessation of her whole sexual life, (*b*) the one which leads to a defiant over-emphasis of her masculinity, and (*c*) the first steps towards definitive femininity. It is not easy to determine the exact timing here or the typical course of events. Even the point of time when the discovery of castration is made varies, and a number of other factors seem to be inconstant and to depend on chance. The state of the girl's own phallic activity plays a part; and so too does the question whether or not this activity was found out, and how much interference with it she experienced afterwards. [232]

Little girls usually discover for themselves their characteristic phallic activity – masturbation of the clitoris;[2] and to begin with this is no doubt unaccompanied by phantasy. The part played in starting it by nursery hygiene is reflected in the very common phantasy which makes the mother or nurse into a seducer.[3] Whether little girls masturbate less

1 [Cf. "'A Child is Being Beaten'" (1919*e*), *RSE*, **17**, 183–4.]

2 [Cf. *Three Essays* (1905*d*), ibid., **7**, 194–5.]

3 [Cf. a fuller discussion of this below, p. 227.]

frequently and from the first less energetically than little boys is not certain; quite possibly it is so. Actual seduction, too, is common enough; it is initiated either by other children or by someone in charge of the child who wants to soothe it, or send it to sleep or make it dependent on them. Where seduction intervenes it invariably disturbs the natural course of the developmental processes, and it often leaves behind extensive and lasting consequences.

A prohibition of masturbation, as we have seen, becomes an incentive for giving it up; but it also becomes a motive for rebelling against the person who prohibits it – that is to say, the mother, or the mother substitute who later regularly merges with her. A defiant persistence in masturbation appears to open the way to masculinity. Even where the girl has not succeeded in suppressing her masturbation, the effect of the apparently vain prohibition is seen in her later efforts to free herself at all costs from a satisfaction which has been spoilt for her. When she
[233] reaches maturity her object choice may still be influenced by this persisting purpose. Her resentment at being prevented from free sexual activity plays a big part in her detachment from her mother. The same motive comes into operation again after puberty, when her mother takes up her duty of guarding her daughter's chastity.[1] We shall, of course, not forget that the mother is similarly opposed to a boy's masturbating and thus provides him, too, with a strong motive for rebellion.

When the little girl discovers her own deficiency, from seeing a male genital, it is only with hesitation and reluctance that she accepts the unwelcome knowledge. As we have seen, she clings obstinately to the expectation of one day having a genital of the same kind too, and her wish for it survives long after her hope has expired. The child invariably regards castration in the first instance as a misfortune peculiar to herself; only later does she realize that it extends to certain other children and lastly to certain grown-ups.[2] When she comes to understand the general nature of this characteristic, it follows that femaleness – and with it, of course, her mother – suffers a great depreciation in her eyes.

This account of how girls respond to the impression of castration and the prohibition against masturbation will very probably strike the reader as confused and contradictory. This is not entirely the author's fault. In truth, it is hardly possible to give a description which has general validity. We find the most different reactions in different individuals, and in the same individual the contrary attitudes exist side by side. With the

1 [Cf. 'A Case of Paranoia' (1915*f*), *RSE*, **14**, 265.]

2 [Cf. an instance in a footnote to Chapter III of *The Ego and the Id* (1923*b*), ibid., **19**, 27 *n*. 1.]

first intervention of the prohibition, the conflict is there, and from now on it will accompany the development of the sexual function. Insight into what takes place is made particularly difficult by the fact of its being so hard to distinguish the mental processes of this first phase from later ones by which they are overlaid and are distorted in memory. Thus, for instance, a girl may later construe the fact of castration as a punishment for her masturbatory activity, and she will attribute the carrying out of this punishment to her father, but neither of these ideas can have been a primary one. Similarly, boys regularly fear castration from their father, although in their case, too, the threat most usually comes from their mother.

However this may be, at the end of this first phase of attachment to [234] the mother, there emerges, as the girl's strongest motive for turning away from her, the reproach that her mother did not give her a proper penis – that is to say, brought her into the world as a female.[1] A second reproach, which does not reach quite so far back, is rather a surprising one. It is that her mother did not give her enough milk, did not suckle her long enough. Under the conditions of modern civilization this may be true often enough, but certainly not so often as is asserted in analyses. It would seem rather that this accusation gives expression to the general dissatisfaction of children, who, in our monogamous civilization, are weaned from the breast after six or nine months, whereas the primitive mother devotes herself exclusively to her child for two or three years. It is as though our children had remained for ever unsated, as though they had never sucked long enough at their mother's breast. But I am not sure whether, if one analysed children who had been suckled as long as the children of primitive peoples, one would not come upon the same complaint. Such is the greed of a child's libido!

When we survey the whole range of motives for turning away from the mother which analysis brings to light – that she failed to provide the little girl with the only proper genital, that she did not feed her sufficiently, that she compelled her to share her mother's love with others, that she never fulfilled all the girl's expectations of love, and, finally, that she first aroused her sexual activity and then forbade it – all these motives seem nevertheless insufficient to justify the girl's final hostility. Some of them follow inevitably from the nature of infantile sexuality; others appear like rationalizations devised later to account for the uncomprehended change in feeling. Perhaps the real fact is that the

1 [Freud had pointed this out in the last paragraph of Section I of his paper on 'Some Character-Types' (1916*d*), *RSE*, **14**, 319.]

attachment to the mother is bound to perish, precisely because it was the first and was so intense; just as one can often see happen in the first marriages of young women which they have entered into when they were most passionately in love. In both situations the attitude of love probably comes to grief from the disappointments that are unavoidable and from the accumulation of occasions for aggression. As a rule, second marriages turn out much better.

[235] We cannot go so far as to assert that the ambivalence of emotional cathexes is a universally valid law, and that it is absolutely impossible to feel great love for a person without its being accompanied by a hatred that is perhaps equally great, or *vice versa*. Normal adults do undoubtedly succeed in separating those two attitudes from each other, and do not find themselves obliged to hate their love objects and to love their enemy as well as hate him. But this seems to be the result of later developments. In the first phases of erotic life, ambivalence is evidently the rule. Many people retain this archaic trait all through their lives. It is characteristic of obsessional neurotics that in their object relationships love and hate counterbalance each other. In primitive races, too, we may say that ambivalence predominates.[1] We shall conclude, then, that the little girl's intense attachment to her mother is strongly ambivalent, and that it is in consequence precisely of this ambivalence that (with the assistance of the other factors we have adduced) her attachment is forced away from her mother – once again, that is to say, in consequence of a general characteristic of infantile sexuality.

The explanation I have attempted to give is at once met by a question: 'How is it, then, that boys are able to keep intact their attachment to their mother, which is certainly no less strong than that of girls?' The answer comes equally promptly: 'Because boys are able to deal with their ambivalent feelings towards their mother by directing all their hostility on to their father.' But, in the first place, we ought not to make this reply until we have made a close study of the pre-Oedipus phase in boys, and, in the second place, it is probably more prudent in general to admit that we have as yet no clear understanding of these processes, with which we have only just become acquainted.

III

A further question arises: 'What does the little girl require of her mother? What is the nature of her sexual aims during the time of exclusive

1 [See *Totem and Taboo* (1912–13*a*), *RSE*, **13**, and especially the second essay.]

attachment to her mother?' The answer we obtain from the analytic material is just what we should expect. The girl's sexual aims in regard [236]
to her mother are active as well as passive and are determined by the libidinal phases through which the child passes. Here the relation of activity to passivity is especially interesting. It can easily be observed that in every field of mental experience, not merely that of sexuality, when a child receives a passive impression it has a tendency to produce an active reaction. It tries to do itself what has just been done to it. This is part of the work imposed on it of mastering the external world and can even lead to its endeavouring to repeat an impression which it would have reason to avoid on account of its distressing content. Children's play, too, is made to serve this purpose of supplementing a passive experience with an active piece of behaviour and of thus, as it were, annulling it. When a doctor has opened a child's mouth, in spite of his resistance, to look down his throat, the same child, after the doctor has gone, will play at being the doctor himself, and will repeat the assault upon some small brother or sister who is as helpless in his hands as he was in the doctor's.[1] Here we have an unmistakable revolt against passivity and a preference for the active role. This swing-over from passivity to activity does not take place with the same regularity or vigour in all children; in some it may not occur at all. A child's behaviour in this respect may enable us to draw conclusions as to the relative strength of the masculinity and femininity that it will exhibit in its sexuality.

The first sexual and sexually coloured experiences which a child has in relation to its mother are naturally of a passive character. It is suckled, fed, cleaned and dressed by her, and taught to perform all its functions. A part of its libido goes on clinging to those experiences and enjoys the satisfactions bound up with them; but another part strives to turn them into activity. In the first place, being suckled at the breast gives place to active sucking. As regards the other experiences the child contents itself either with becoming self-sufficient – that is, with itself successfully carrying out what had hitherto been done for it – or with repeating its passive experiences in an active form in play; or else it actually makes its mother into the object and behaves as the active subject towards her. For a long time I was unable to credit this last behaviour, which takes place in the field of real action, until my observations removed all doubts [237]
on the matter.

We seldom hear of a little girl's wanting to wash or dress her mother, or tell her to perform her excretory functions. Sometimes, it is true, she

1 [Cf. the similar passage in Chapter II of *Beyond the Pleasure Principle* (1920*g*), *RSE*, **18**, 16.]

says: 'Now let's play that I'm the mother and you're the child'; but generally she fulfils these active wishes in an indirect way, in her play with her doll, in which she represents the mother and the doll the child. The fondness girls have for playing with dolls, in contrast to boys, is commonly regarded as a sign of early awakened femininity. Not unjustly so; but we must not overlook the fact that what finds expression here is the *active* side of femininity, and that the little girl's preference for dolls is probably evidence of the exclusiveness of her attachment to her mother, with complete neglect of her father object.

The very surprising sexual activity of little girls in relation to their mother is manifested chronologically in oral, sadistic, and finally even in phallic trends directed towards her. It is difficult to give a detailed account of these because they are often obscure drive impulses [*Trieb-regungen*][T] which it was impossible for the child to grasp psychically at the time of their occurrence, which were therefore interpreted [*Interpretation*] by her only later [*nachträgliche*][T], and which then appear in the analysis in forms of expression that were certainly not the original ones. Sometimes we come across them as transferences on to the later, father object, where they do not belong and where they seriously interfere with our understanding of the situation. We find the little girl's aggressive oral and sadistic wishes in a form forced on them by early repression, as a fear of being killed by her mother – a fear which, in turn, justifies her death wish against her mother, if that becomes conscious. It is impossible to say how often this fear of the mother is supported by an unconscious hostility on the mother's part which is sensed by the girl.[1] (Hitherto, it is only in men that I have found the fear of being eaten up. This fear is referred to the father, but it is probably the product of a transformation of oral aggressivity directed to the mother. The child wants to eat up its mother from whom it has had its nourishment; in the case of the father there is no such obvious determinant for the wish.)

Trieb

Nachträglichkeit

The women patients showing a strong attachment to their mother in whom I have been able to study the pre-Oedipus phase have all told me that when their mother gave them enemas or rectal douches they used to offer the greatest resistance and react with fear and screams of rage. This behaviour may be very frequent or even the habitual thing in children. I only came to understand the reason for such a specially violent opposition from a remark made by Ruth Mack Brunswick, who was studying these problems at the same time as I was, to the effect that she was inclined to compare the outbreak of anger after an enema to the

[238]

1 [Cf. above, p. 217.]

orgasm following genital excitation. The accompanying anxiety should, she thought, be construed as a transformation of the desire for aggression [*Aggressionslust*][T] which had been stirred up. I believe that this is *Lust* really so and that, at the sadistic-anal level, the intense passive stimulation of the intestinal zone is responded to by an outbreak of desire for aggression which is manifested either directly as rage, or, in consequence of its suppression, as anxiety. In later years this reaction seems to die away.

In regard to the passive impulses of the phallic phase, it is noteworthy that girls regularly accuse their mother of seducing them. This is because they necessarily received their first, or at any rate their strongest, genital sensations when they were being cleaned and having their toilet attended to by their mother (or by someone such as a nurse who took her place). Mothers have often told me, as a matter of observation, that their little daughters of two and three years old enjoy these sensations and try to get their mothers to make them more intense by repeated touching and rubbing. The fact that the mother thus unavoidably initiates the child into the phallic phase is, I think, the reason why, in phantasies of later years, the father so regularly appears as the sexual seducer. When the girl turns away from her mother, she also makes over to her father her introduction into sexual life.[1]

Lastly, intense *active* wishful impulses directed towards the mother [239] also arise during the phallic phase. The sexual activity of this period culminates in clitoridal masturbation. This is probably accompanied by ideas [*vorgestellt*] of the mother, but whether the child attaches a sexual aim to the idea [*Vorstellung*][T], and what that aim is, I have not been able to discover from my observations. It is only when all her interests have received a fresh impetus through the arrival of a baby brother or sister that we can clearly recognize such an aim. The little girl wants to believe that she has given her mother the new baby, just as the boy wants to; and her reaction to this event and her behaviour to the baby is exactly the same as his. No doubt this sounds quite absurd, but perhaps that is only because it sounds so unfamiliar.

1 [This is the last phase of a long story. When, in his early analyses, Freud's hysterical patients told him that they had been seduced by their father in childhood, he accepted these tales as the truth and regarded the traumas as the cause of their illness. It was not long before he recognized his mistake, and he admitted it in a letter to Fliess of September 21, 1897 (Freud, 1950*a*, Letter 69). He soon grasped the important fact that these apparently false memories were wishful phantasies, which pointed the way to the existence of the Oedipus complex. An account of his contemporary reactions to these discoveries is given in Chapter III of his *Autobiographical Study* (1925*d*), *RSE*, **20**, 29–30. It was only in the present passage that Freud gave his full explanation of these ostensible memories. He discusses this whole episode at greater length in Lecture XXXIII of his *New Introductory Lectures* (1933*a*), ibid, **22**, 106 ff.]

The turning away from her mother is an extremely important step in the course of a little girl's development. It is more than a mere change of object. We have already described what takes place in it and the many motives put forward for it; we may now add that hand in hand with it there is to be observed a marked lowering of the active sexual impulses and a rise of the passive ones. It is true that the active trends have been affected by frustration [*Versagung*][T] more strongly; they have proved totally unrealizable and are therefore abandoned by the libido more readily. But the passive trends have not escaped disappointment either. With the turning away from the mother clitoridal masturbation frequently ceases as well; and often enough when the small girl represses her previous masculinity a considerable portion of her sexual trends in general is permanently injured too. The transition to the father object is accomplished with the help of the passive trends insofar as they have escaped the catastrophe. The path to the development of femininity now lies open to the girl, to the extent to which it is not restricted by the remains of the pre-Oedipus attachment to her mother which she has surmounted.

If we now survey the stage of sexual development in the female which I have been describing, we cannot resist coming to a definite conclusion
[240] about femininity as a whole. We have found the same libidinal forces [*Kräfte*][T] at work in it as in the male child and we have been able to convince ourselves that for a period of time these forces follow the same course and have the same outcome in each.

Biological factors subsequently deflect those libidinal forces [in the girl's case] from their original aims and conduct even active and in every sense masculine trends into feminine channels. Since we cannot dismiss the notion that sexual excitation is derived from the operation of certain chemical substances, it seems plausible at first to expect that biochemistry will one day disclose a substance to us whose presence produces a male sexual excitation and another substance which produces a female one. But this hope seems no less naive than the other one – happily obsolete today – that it may be possible under the microscope to isolate the different exciting factors of hysteria, obsessional neurosis, melancholia, and so on.

Even in sexual chemistry things must be rather more complicated.[I]

1 [Cf. the discussion of the chemistry of the sexual processes added in 1920 to the *Three Essays* (1905*d*), *RSE*, 7, 190, where (in a footnote on the following page) the earlier version from the first edition of the book can also be found. See also the Editors' footnote on p. 72 above.]

For psychology, however, it is a matter of indifference whether there is a single sexually exciting substance in the body or two or countless numbers of them. Psychoanalysis teaches us to manage with a single libido, which, it is true, has both active and passive aims (that is, modes of satisfaction). This antithesis and, above all, the existence of libidinal trends with passive aims, contains within itself the remainder of our problem.

IV

An examination of the analytic literature on the subject shows that everything that has been said by me here is already to be found in it.[1] It would have been superfluous to publish this paper if it were not that in a field of research which is so difficult to access every account of first-hand experiences or personal views [*Auffassungen*][T] may be of value. [241]
Moreover, there are a number of points which I have defined more sharply and isolated more carefully. In some of the other papers on the subject the description is obscured because they deal at the same time with the problems of the superego and the sense of guilt. This I have avoided doing. Also, in describing the various outcomes of this phase of development, I have refrained from discussing the complications which arise when a child, as a result of disappointment from her father, returns to the attachment to her mother which she had abandoned, or when, in the course of her life, she repeatedly changes over from one position to the other. But precisely because my paper is only one contribution among others, I may be spared an exhaustive survey of the literature, and I can confine myself to bringing out the more important points on which I agree or disagree with these other writings.

Abraham's (1921) description of the manifestations of the castration complex in the female is still unsurpassed; but one would be glad if it had included the factor of the girl's original exclusive attachment to her mother. I am in agreement with the principal points in Jeanne Lampl-de Groot's[2] (1927) important paper. In this the complete identity of the pre-Oedipus phase in boys and girls is recognized, and the girl's sexual (phallic) activity towards her mother is affirmed and substantiated by

1 [It should be pointed out that recent works by other authors discussed in what follows appeared *after* Freud's earlier paper on 'Some Psychical Consequences of the Anatomical Distinction between the Sexes' (1925*j*), *RSE*, **19**, 249, which covered the majority of the points in the present paper but to which he here makes no reference at all. See Editors' Note, p. 213 above.]

2 The author's name was given when it appeared in the *Zeitschrift* as 'A. Lampl-de Groot', and I correct it here at her request.

observations. The turning away from the mother is traced to the influence of the girl's recognition of castration, which obliges her to give up her sexual object, and often masturbation along with it. The whole development is summed up in the formula that the girl goes through a phase of the 'negative' Oedipus complex before she can enter the positive one. A point on which I find the writer's account inadequate is that it represents the turning away from the mother as being merely a change of object and does not discuss the fact that it is accompanied by the plainest manifestations of hostility. To this hostility full justice is done in Helene Deutsch's latest paper, on feminine masochism and its relation to frigidity (1930), in which she also recognizes the girl's phallic activity and the intensity of her attachment to her mother. Helene Deutsch states further that the girl's turning towards her father takes place via her passive trends (which have already been awakened in relation to her mother). In her earlier book (1925) the author had not yet set [242] herself free from the endeavour to apply the Oedipus pattern to the pre-Oedipus phase, and she therefore interpreted the little girl's phallic activity as an identification with her father.

Fenichel (1930) rightly emphasizes the difficulty of recognizing in the material produced in analysis what parts of it represent the unchanged content of the pre-Oedipus phase and what parts have been distorted by regression (or in other ways). He does not accept Jeanne Lampl-de Groot's assertion of the little girl's active attitude in the phallic phase. He also rejects the 'displacement backwards' [*Vorverlegung*] of the Oedipus complex proposed by Melanie Klein (1928), who places its beginnings as early as the commencement of the second year of life. This dating of it, which would also necessarily imply a modification of our view of all the rest of the child's development, does not, in fact, correspond to what we learn from the analyses of adults, and it is especially incompatible with my findings as to the long duration of the girl's pre-Oedipus attachment to her mother. A means of softening this contradiction is afforded by the reflection that we are not as yet able to distinguish in this field between what is rigidly fixed by biological laws and what is open to movement and change under the influence of accidental experience. The effect of seduction has long been familiar to us and in just the same way other factors – such as the date at which the child's brothers and sisters are born or the time when it discovers the difference between the sexes, or again its direct observations of sexual intercourse or its parents' behaviour in encouraging or repelling it – may hasten the child's sexual development and bring it to maturity.

Some writers are inclined to reduce the importance of the child's first and most original libidinal impulses in favour of later developmental processes, so that – to put this view in its most extreme form – the only role left to the former is merely to indicate certain paths, while the [psychical] intensities[1] which flow along those paths are supplied by later regressions and reaction-formations. Thus, for instance, Karen Horney (1926) is of the opinion that we greatly overestimate the girl's primary penis envy and that the strength of the masculine trend which she develops later is to be attributed to a *secondary* penis envy which is used to fend off [*Abwehr*][T] her feminine impulses and, in particular, her feminine attachment to her father. This does not tally with my impressions. Certain as is the occurrence of later reinforcements through regression and reaction-formation, and difficult as it is to estimate the relative strength of the confluent libidinal components, I nevertheless think that we should not overlook the fact that the first libidinal impulses have an intensity of their own which is superior to any that come later and which may indeed be termed incommensurable. It is undoubtedly true that there is an antithesis between the attachment to the father and the masculinity complex; it is the general antithesis that exists between activity and passivity, masculinity and femininity. But this gives us no right to assume that only one of them is primary and that the other owes its strength merely to the force of defence. And if the defence against femininity is so energetic, from what other source can it draw its strength than from the masculine trend which found its first expression in the child's penis envy and therefore deserves to be named after it? [243]

A similar objection applies to Ernest Jones's view (1927) that the phallic phase in girls is a secondary, protective reaction rather than a genuine developmental stage. This does not correspond either to the dynamic or the chronological position of things.

1 ['*Intensitäten*.' Freud does not often use the word, as here, without any qualifying epithet. It can be found, however, in Chapter VII (E) of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 539, in exactly the same sense as here. Freud is, in fact, using the word as an equivalent to the term 'quantity' which he preferred in the earlier 'Project' of 1895 (Freud, 1950*a*). He seems actually to use the two terms as synonyms towards the beginning of Section (2) of his second paper on anxiety neuroses (1895*f*), ibid., **3**, 115. The term 'quantity' is equated in the metapsychological paper on 'Repression' (1915*d*) with 'drive energy'. See footnote 4, p. 138 above. In Chapter V of his posthumous *Outline of Psychoanalysis* (1940*a* [1938]) Freud uses the term 'psychical intensities' and adds in parentheses 'cathexes' (*RSE*, **23**, 151).]

Shorter Writings

(1929–31)

DR ERNEST JONES

(on his 50th Birthday)[1]

(1929)

The first piece of work that it fell to psychoanalysis to perform was the [249]
discovery of the drives that are common to all men living today – and not only to those living today but to those of ancient and of prehistoric times. It called for no great effort, therefore, for psychoanalysis to ignore the differences that arise among the inhabitants of the earth owing to the multiplicity of races, languages and countries. From the start it was *international*, and it is well known that its followers overcame the dividing effects of the Great War sooner than any others.

Among the men who met at Salzburg in the spring of 1908 for the first Psychoanalytical Congress, a young English physician was prominent, who delivered a short paper on 'Rationalization in Everyday Life'. The contents of this first-fruit hold good to this day: our young science was enriched by an important concept and an indispensable term.

From that time on Ernest Jones has never rested. First in his post as a professor in Toronto, then as a physician in London, as the founder and teacher of a Branch Society, as director of a Press, as editor of a journal, and as head of a training institute, he has worked tirelessly for psychoanalysis, making its current findings generally known by means of lectures, defending it against the attacks and misunderstandings of its opponents by means of brilliant, severe but fair criticisms, maintaining its difficult position in England against the demands of the 'profession'[2] with tact and moderation, and, alongside of all these externally directed activities, accomplishing, in loyal cooperation with the development of psychoanalysis on the Continent, the scientific achievement to which, among other works, his *Papers on Psycho-Analysis* and *Essays in* [250]
Applied Psycho-Analysis bear witness. Now, in the prime of life, he is

1 [*Int. Z. Psychoan.*, **15** (2–3) (1929), 147; *GS*, **12** (1934), 395; *GW*, **14** (1948), 554. English translation: *Int. J. Psycho-Anal.*, **10** (2–3) (1929), 123. (Tr. unspecified.) Reprinted (with modifications): *SE*, **21** (1961), 249 f. The present translation is a very slightly amended reprint of the *SE* version. This tribute served as the introduction to double numbers both of the *Zeitschrift* and of the *Journal* in celebration of the fiftieth anniversary of Ernest Jones's birth on January 1, 1879.]

2 [In English in the original.]

not only indisputably the leading figure among English-speaking analysts, but is also recognized as one of the foremost representatives of psychoanalysis as a whole – a mainstay for his friends and, as much as ever, a hope for the future of our science.

Now that the Director of this journal[1] has broken the silence to which he is condemned – or to which he has a right – owing to his age, in order to greet his friend, he may be permitted to conclude – not with a wish, for we do not believe in the omnipotence of thoughts – but with the admission that he cannot think of Ernest Jones, even after his fiftieth birthday, as other than before: zealous and energetic, combative and devoted to the cause.

1 [Freud was described as '*Herausgeber*' ('Director') both of the *Zeitschrift* and of the *Journal*.]

TWO LETTERS TO ALBERT EINSTEIN[1]

(1994 [1929])

Tegel, March 13, 1929

Sir,

By coincidence I am able to greet you on your 50th birthday from nearby.

It would be superfluous to wish you good fortune. I would rather rejoice with countless numbers of others at the fact that you have had, and are still having, so much good fortune.

Your truly devoted,
Sigm. Freud
(aet. 73)

Vienna, March 26, 1929

Dear Sir,

You are of course right.[2] Since I know so little about you, I have no right to deem you fortunate – although I earnestly wish and hope that you are.

Please do not think that I am trying to draw you into a correspondence if I now give way to the temptation to explain my transgression to you. On the contrary, I beg you *not* to reply to me. It is easier for me to write if I can count on that.

Wishing people good fortune is really repugnant to me; it seems cheap and primitively animistic to me, as if one still believed in the 'omnipotence of thoughts'. If, as in your case, the giving of a present is also

1 [This exchange of letters, the first correspondence between Freud and Einstein (who had met in 1926/7), was discovered in 1991 among Freud's papers in the Library of Congress by Ilse Grubrich-Simitis. The exchange (including Einstein's reply; see footnote 2 below) was published together with extensive editorial commentary by Grubrich-Simitis, in German, in 1994 in the *Neue Rundschau*, **105** (1), 107–18, and in English translation (by Philip Slotkin) in 1995 in the *Int. J. Psycho-Anal.*, **76**, 115–22. The present translation is by Mark Solms.]

2 [Einstein had replied (on March 22) as follows: 'I thank you sincerely for thinking of me. Why do you emphasize good fortune? Although you have slipped into the skins of so many people, indeed of mankind itself, you have had no opportunity of slipping into mine!']

precluded, then it is easy when seeking a way of expressing admiration and solidarity to be led astray in the manner with which you reproach me. It all goes to show how expedient the stupid conventions of our society actually are, and also that it is advisable to do the same as everyone else.

Yet, for me there was sense in what I wrote. It was the expression of my envy, which I freely admit. Envy need not be something ugly. Envy can include admiration and is compatible with the friendliest of feelings for the person envied.

But in deciding what I should envy you for, I was not troubled by my ignorance.

Above all there was the consideration of how much more fortunate it is to be a completer than a pioneer. It seems to me that no special intellectual endowment is called for to open a new field of science or technology, but rather certain character traits: the daring of an adventurer, capacity for self-belief, and a kind of disdain for consensus with others. For that one easily becomes famous, or notorious; but if one has retained some critical faculty, one cannot fail to still see how crude, incomplete and even fragmentary such an initial achievement in virgin territory is, and one cannot fail to see how apt it is to imbue one with a sense of the feebleness of a lone intellect before the magnitude of the task.

If the virgin territory is psychological territory, something else comes into play. All our attention is directed to the outside, whence dangers threaten and satisfactions beckon. From the inside, we want only to be left in peace. So when someone tries to direct awareness [*den Sinn*] inward, in effect attempting to twist its neck around, our mental organization resists – somewhat as the oesophagus and urethra resist any attempt to reverse their normal direction of passage. Then the whole world unites in contradiction; and this contradiction, over decades, from countless people, although not persuasive, is exhausting. And everyone finds contradiction so easy precisely in the field of psychology. In astronomy, physics and chemistry one requires specialized preparation in order to qualify for passing judgement. Unless one is simply mad, like Strindberg,[1] one is wary of contradicting science if one has not met that criterion. This does not hold for psychology. Every man is an expert on the mind [*Seelenkenner*][T]; every man knows just as well as you, or better, without having gone to any trouble. And since they have

1 [An allusion to the author Strindberg's notorious indulgence in amateur activity in a variety of disciplines, especially chemistry.]

arrived at their opinions so cheaply, they do not believe that someone else will have gone to any greater expense for theirs.

Admittedly, it is not altogether a matter of regret that one has opted for psychology. There is no greater, richer, more mysterious subject, worthy of every effort of the human intellect, than the life of the mind. Psychology surely is the most lovely of all the noble ladies; it is just that her knight is doomed to remain unhappy in his love.

I used to think that we had still more to envy the physicist for: the beautiful clarity, precision and certainty of the fundamental concepts of his science, such as force, mass, acceleration and the like. I have since learnt that this is merely semblance. If someone reproaches us with the indefiniteness and vagueness of our libido, energies, drives [*Triebe*][T] and cathexes [*Besetzungen*][T], I am now in the habit of appealing to the example of physics and asserting that, while clear fundamental concepts may be demanded of the Humanities [*Geisteswissenschaften*], this does not apply to a true natural science.

Why am I writing all this to you? To justify myself; to show what I had in mind when I called you a fortunate person whom I am bound to envy. After all, you should not be left with the impression that I avoided wishing you good fortune on your half-century by having recourse to an even emptier formula. If I have achieved only this purpose, I should prefer it if you would destroy this letter – a monologue intended for you alone.

Remember me as one of the many who rejoice that Albert Einstein is living and working in their time.

Your truly devoted,
Freud

LETTER TO JULIETTE BOUTONIER[1]

(1955 [1930])

April 11, 1930
Vienna

Dear Fräulein,

Forgive me for replying to you in German: French would be too difficult for me, and I hope you will easily find someone to translate this letter for you.

Philosophical problems and formulations are so foreign to me that I do not know where to begin with them, and this applies to Spinoza's philosophy too.[2] If I had time and inclination I would probably succeed in making my viewpoint clear to you. But I will limit myself to saying that I do not have difficulty in acknowledging the existence of a physical world alongside the psychical, in the sense that the latter is a portion of the former. The question of the relationship between physical and psychical arises only for the latter (the psychical). The physical world has a psychical aspect insofar as it, too, can only become known to us through psychical perception. On the other hand our psychical perceptions also force upon us the necessity of the assumption of a physical reality behind mental life. I do not know whether you can do anything

1 [First published in the *Bulletin de la société française de philosophie*, **49** (1), 3–4, together with a French translation by Juliette Favez-Boutonier, who explained that Freud wrote the letter in response to metaphysical questions she had ventured to put to him while she was still a philosophy student in Dijon. The German text was reprinted in 1987 in *GW*, **Nachtr.**, 671. The present translation by Mark Solms is the first into English.]

2 [In a letter to Siegfried Hessing on the same subject, published in his *Festschrift Spinoza*, Heidelberg, 1933 (p. 221), and reprinted in *GW*, **Nachtr.**, 670, not previously published in English translation, Freud (1933*f* [1932]) wrote the following: 'I have throughout my long life evinced extraordinary respect, and a little awe, for the personality and intellectual achievements of the great philosopher Spinoza. However, I do not believe that this attitude gives me the right to say something about him to all the world, especially since I do not have anything to say that has not been said already by others. With these remarks, please excuse me from participation in the envisaged *Festschrift*, and be assured of my solidarity and respect.']

with these sentences. The notion of the unconscious has overturned all earlier formulations of the problem.[1]

Sincerely,
Freud

1 [Cf. Freud's remark in a letter to Georg Groddeck dated June 5, 1917: 'The unconscious is the proper mediator between the somatic and the mental, perhaps the long-sought "missing link".' In *An Outline of Psychoanalysis* (1940*a* [1938]), *RSE*, **23**, and in other places where Freud expressed similar views, he explains: the mental apparatus is unconscious 'in itself', in Kant's sense.]

INTRODUCTION TO THE SPECIAL PSYCHOPATHOLOGY NUMBER OF *THE MEDICAL REVIEW OF REVIEWS*[1]

(1930)

[254] Dr Feigenbaum has asked me to write a few words for the [number of the] Review of which he is in charge, and I take the opportunity of wishing the best success to his undertaking.

I often hear that psychoanalysis is very popular in the United States and that it does not come up against the same stubborn resistance there as it does in Europe. My satisfaction over this is, however, clouded by several circumstances.[2] It seems to me that the popularity of the name of psychoanalysis in America signifies neither a friendly attitude to the thing itself nor any specially wide or deep knowledge of it. As evidence of the former fact I may point out that, although financial support is to be had easily and in plenty for every kind of scientific and pseudo-scientific enterprise, we have never succeeded in obtaining a backing for our psychoanalytic institutions. Nor is it hard to find evidence for my second assertion. Although America possesses several excellent analysts and, in Dr A. A. Brill, at least one authority, the contributions to our science from that vast country are exiguous and provide little that is new. Psychiatrists and neurologists make frequent use of psychoanalysis as a therapeutic method, but as a rule they show little interest in its scientific problems and its cultural significance. Quite particularly often we find in American physicians and writers a very insufficient familiarity with psychoanalysis, so that they know only its terms and a few catch-words – though this does not shake them in the certainty of their judgement. And these same men lump psychoanalysis with other sys-
[255] tems of thought, which may have developed out of it but are incompatible with it today. Or they make a hotchpotch out of

1 [First published in English in *The Medical Review of Reviews*, **36** (3) (March, 1930), 103. (Tr. unspecified.) First German edition, *GS*, **12** (1934), 386; reprinted *GW*, **14** (1948), 570. The present translation is the new one, by James Strachey first published in *SE*, **21** (1961), 254 f. – In the *GS* the periodical to which this was contributed was wrongly described as '*The Psychoanalytic Review*'. The special 'Psychopathology Number' of *The Medical Review of Reviews* was edited by Dr Dorian Feigenbaum.]

2 [Similar sentiments to those which follow were expressed in the suppressed passage appended to the 1927 Postscript to *The Question of Lay Analysis*, *RSE*, **20**, 233 ff.]

psychoanalysis and other elements and quote this procedure as evidence of their *broad-mindedness*, whereas it only proves their *lack of judgement*.[1]

Many of these evils which I have mentioned with regret no doubt arise from the fact that there is a general tendency in America to shorten study and preparation and to proceed as fast as possible to practical application. There is a preference, too, for studying a subject like psychoanalysis not from the original sources but from second-hand and often inferior accounts. Thoroughness is bound to suffer from this.

It is to be hoped that works of the kind that Dr Feigenbaum intends to publish in his Review will be a powerful encouragement to the interest in psychoanalysis in America.

1 [The words in italics are in English in the original.]

THE EXPERT OPINION IN THE HALSMANN CASE[1]

(1930)

[251] The Oedipus complex, as far as we know, is present in childhood in all human beings, undergoes great alterations during the years of development and in many individuals is found in varying degrees of strength even at a mature age. Its essential characteristics, its universality, its content and its fate were recognized, long before the days of psychoanalysis, by that acute thinker Diderot, as is shown by a passage in his famous dialogue, *Le neveu de Rameau*: 'Si le petit sauvage était abandonné à lui-même, qu'il conservât toute son imbécillité, et qu'il réunît au peu de raison de l'enfant au berceau la violence des passions de l'homme de trente ans, il tordrait le col à son père et coucherait avec sa mère.'[2]

[252] If it had been objectively demonstrated that Philipp Halsmann murdered his father, there would at all events be some grounds for introducing the Oedipus complex to provide a motive [*Motivierung*] for an otherwise unexplained deed. Since no such proof has been

1 ['Das Fakultätsgutachten im Prozess Halsmann.' *Neue Freie Presse*, December 14 (1930), 13; reprinted *Psychoan. Beweg.*, **3** (1) (1931), 32; *GS*, **12** (1934), 412; *Z. Psychoan. Päd.*, **9** (1935), 208; *GW*, **14** (1948), 541. The present translation is a reprint of the one by Angela Richards: *SE*, **21** (1961), 251–3. In all previous editions, the first German edition was overlooked and the publication date was accordingly given as 1931. – A young student, Philipp Halsmann, was brought before an Innsbruck court in 1929, charged with parricide. The court, feeling doubts as to the mental state of the prisoner, asked for an expert opinion from the Innsbruck Faculty of Medicine. The opinion, though it introduced the subjects of the Oedipus complex and of repression, evidently displayed both ignorance and ambivalence towards psychoanalysis. The Innsbruck court found the prisoner guilty, and an appeal to the appeal court in Vienna failed on January 21, 1930. Halsmann was, however, subsequently pardoned. Nevertheless, Dr Josef Kupka, Professor of Jurisprudence in the University of Vienna, felt that the young man was left with an undeserved slur on his character and began an active campaign to overturn the original court decision, in the course of which he published a long article in the *Neue Freie Presse* (November 29 and 30, 1930) criticizing the Innsbruck expert opinion. In preparing his case, Professor Kupka asked for Freud's views on the question, and the present memorandum was the result.]

2 ['If the little savage were left to himself, preserving all his foolishness and adding to the small sense of a child in the cradle the violent passions of a man of thirty, he would strangle his father and lie with his mother.' Freud quotes the passage here in Goethe's translation. He had quoted it, in the original, a long time before, in Lecture XXI of his *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 297, and introduced it again at the end of Part II of the *Outline of Psychoanalysis* (1940*a* [1938]), ibid., **23**, 173.]

adduced, mention of the Oedipus complex has a misleading effect; it is at the least idle. Such disagreements as have been uncovered by the investigation in the Halsmann family between the father and son are altogether inadequate to provide a foundation for assuming in the son a bad relationship towards his father. Even if it were otherwise, we should be obliged to say that it is a far cry from there to the causation [*Verursachung*] of such a deed. Precisely because it is always present, the Oedipus complex is not suited to provide a decision on the question of guilt. The situation envisaged in a well-known anecdote might easily be brought about. There was a burglary. A man who had a jemmy in his possession was found guilty of the crime. After the verdict had been given and he had been asked if he had anything to say, he begged to be sentenced for adultery at the same time – since he was carrying the tool for that on him as well.

In Dostoevsky's great novel *The Brothers Karamazov*, the Oedipus situation stands at the focal point of interest. Old Karamazov has made himself detested by his sons through heartless oppression; in the eyes of one of them he is, in addition, a powerful rival for the woman he desires. This son, Dmitri, makes no secret of his intention to avenge himself on his father by force. It is therefore natural that after his father has been murdered and robbed he should be accused as his murderer and, despite all protestations of his innocence, condemned. And yet Dmitri is innocent; another of the brothers has done the deed. A dictum that has become famous occurs during the trial scene in this novel: 'Psychology is a knife that cuts both ways.'[1]

The Opinion of the Innsbruck Faculty of Medicine seems inclined to attribute an 'effective' Oedipus complex to Philipp Halsmann, but refrains from defining the measure of this effectiveness, since under the [253]
pressure of the accusation the necessary conditions for 'an unreserved disclosure' on Philipp Halsmann's part were not fulfilled. When the Faculty go on to refuse even 'on the supposition of the accused being guilty to look for the root of the deed in an Oedipus complex', they are carrying their denial [*Verleugnung*][T] too far without any necessity.

In the same Opinion, we come up against a contradiction which is by no means without significance. The possible influence of emotional shock on the disturbance of memory with regard to impressions before and during the critical time is minimized to the extreme, in my opinion

1 [Freud had quoted this remark not long before in his paper on 'Dostoevsky and Parricide' (1928*b*), p. 176 above, and introduced it again in the paper on 'Female Sexuality' (1931*b*), p. 220 *n*. 1 above. The simile actually used in the German and in the Russian original is 'a stick with two ends'. The present version is derived from Constance Garnett's translation.]

unjustly. The assumptions of an exceptional state of mind or of mental illness are decisively rejected, but the explanation of a 'repression' ['*Verdrängung*'][T] having taken place in Philipp Halsmann after the deed is readily allowed. I must say, however, that a repression of this kind, occurring out of the blue in an adult who gives no indication of a severe neurosis – the repression of an action which would certainly be more important than any debatable details of distance and the passage of time and which takes place in a normal state or one altered only by physical fatigue – would be a rarity of the first order.

INTRODUCTION TO EDOARDO WEISS'S *ELEMENTS OF PSYCHOANALYSIS*[1]

(1931 [1930])

The author of these lectures, my friend and pupil Dr Edoardo Weiss, has expressed a wish that I should send his work on its way with a few words of recommendation. In doing so I am fully aware that such a recommendation is superfluous. The work speaks for itself. All who know how to appreciate the seriousness of a scientific endeavour, how to value the honesty of an investigator who does not seek to belittle or deny the difficulties, and how to take pleasure in the skill of a teacher who brings light into darkness and order into chaos by his exposition, must form a high estimate of this book and share my hope that it will awaken among cultivated and learned circles in Italy a lasting interest in the young science of psychoanalysis. [256]

Weiss's *Elementi di psicoanalisi*, Milan, 1931, vi–vii (dated 'Grundlsee, August, 1930'); 1933, 2nd ed.; 1937, 3rd ed.; *GS*, **12** (1934), 389; *GW*, **14** (1948), 573. The present translation, by Angela Richards, appears to be the first into English. It was first published in *SE*, **21** (1961), 256.]

PREFACE TO *TEN YEARS OF THE BERLIN PSYCHOANALYTIC INSTITUTE*[1]

(1930)

[257] The following pages describe the founding and achievements of the Berlin Psychoanalytic Institute, to which are allotted three important functions within the psychoanalytic movement. First, it endeavours to make our therapy accessible to the great multitude who suffer under their neuroses no less than the wealthy, but who are not in a position to meet the cost of their treatment. Secondly, it seeks to provide a centre at which analysis can be taught theoretically and at which the experience of older analysts can be handed on to pupils who are anxious to learn. And lastly, it aims at perfecting our knowledge of neurotic illnesses and our therapeutic technique by applying them and testing them under fresh conditions.

An institute of this kind was indispensable; but we should have waited in vain for assistance from the State or interest from the University in its foundation. Here the energy and self-sacrifice of an individual analyst took the initiative. Ten years ago, Dr Max Eitingon, now President of the International Psychoanalytical Association, created an institute such as this from his own resources, and has since then maintained and directed it by his own efforts. This report on the first decade of the Berlin Institute is a tribute to its creator and director – an attempt to render him public thanks. Everyone who, in whatever sense, has a share in psychoanalysis will unite in thus thanking him.

1 [First published in *Zehn Jahre Berliner Psychoanalytisches Institut*, Leipzig, Vienna and Zürich, (September) 1930; reprinted *GS*, **12** (1934), 388; *GW*, **14** (1948), 572. An English translation appeared in *Max Eitingon in Memoriam*, Jerusalem, 1951, 47. The present translation by James Strachey was first published in *SE*, **21** (1961), 257. – Some years earlier Freud had written a Preface (1923*g*), *RSE*, **19**, 291, to another pamphlet (by Max Eitingon) reporting on the first two years of the activities of the Berlin Institute (then known as the 'Berlin Psychoanalytic Policlinic').]

APPENDIX: APPRECIATION OF MAX EITINGON[1]

(*c.* 1930)

The present text, which reports on the foundation and achievements of the Berlin Psychoanalytical Policlinic, also has another, more intimate purpose. It is intended as a tribute to Dr Max Eitingon, the current President of the 'International Psychoanalytical Association', who established this institute some years ago from his own resources and has since maintained and directed it by his own efforts. The occasion for this tribute was the circumstance that Eitingon, in the fiftieth year of his life, has attained the pinnacle of human existence; the decisive factor in his friends' choice of such a publication was the consideration that the modesty of this reserved man would have rejected any other celebration. Eitingon, although thoroughly versed in psychoanalysis, an experienced therapist and a thinker of certain judgement, has denied himself – and us – the possibility of enriching the analytic literature through his contributions, but he has rather, hardly less important achievements to his credit. As Uhland wrote in his poem 'König Karls Meerfahrt' ['The Voyage of King Charles']:

'Der König Karl am Steuer sass;
Der hat kein Wort gesprochen,
Er lenkt das Schiff mit festen Mass,
Bis sich der Sturm begrochen.'[2]

1 [Ilse Grubrich-Simitis discovered this manuscript in the Library of Congress, Washington. It was first published in German in her book *Zurück zu Freuds Texten* (1993, 291). An English version by Philip Slotkin appeared in his translation of that book (1996, 229–30). Slotkin's translation is reprinted here with very minor modifications. – According to Grubrich-Simitis's reconstruction (ibid., 291–2), the appreciation of Eitingon was probably written in 1930, as an alternative version of Freud's Preface to 'Ten Years of the Berlin Psychoanalytic Institute' (p. 248 above). The principal difference between this and the published Preface is that the present version focused on the figure of Eitingon rather than the Institute. It may be that Eitingon got wind of the more personal version and thwarted its publication. The earlier version could even have been written as early as November 4, 1929, as Freud's diary contains the entry 'Preface for Eitingon' on that date.]

2 ['King Charles sat at the helm,
Saying not a word;
He steered the ship with measure firm,
Till the breaking of the storm.']

It did not seem essential for outsiders to learn of this activity on Eitingon's part; but once at least we must express a public word of thanks to him.

Sigm. Freud

PREFACE TO HERMANN NUNBERG'S *GENERAL THEORY OF THE NEUROSES ON A PSYCHOANALYTIC BASIS*[1]

(1932 [1931])

This volume by Hermann Nunberg contains the most complete and conscientious presentation of a psychoanalytic theory of neurotic processes which we at present possess. Anyone who is anxious to have the relevant problems simplified and smoothed away will scarcely find satisfaction in this work. But anyone who prefers scientific thinking and can appreciate it as a merit when speculation never abandons the guiding line of experience and anyone who can enjoy the beautiful diversity of mental happenings – he will value this work and study it assiduously.[2] [258]

Vienna, *October*, 1931

1 [First published in H. Nunberg's *Allgemeine Neurosenlehre auf psychoanalytischer Grundlage*, Bern and Berlin, 1932, iii; reprinted *GS*, **12** (1934), 390; *GW*, **16** (1950), 273. The present translation, by James Strachey, was first published in *SE*, **21** (1961), 258.]

2 [Part of this last sentence was misprinted in the original and had to be corrected by an inserted erratum slip. The misprint seriously altered the sense. What Freud wrote (as translated above) was: 'Wer aber wissenschaftliches Denken bevorzugt, es als Verdienst zu würdigen weiss, wenn die Spekulation das Leitseil der Erfahrung nie verlässt, und wer die. . . .' The 'wenn' in this sentence was wrongly printed 'wen' and a comma was inserted after 'Spekulation'. As a result of these changes, the sentence might have read in English: 'But anyone who prefers scientific thinking and can appreciate it as a merit, anyone whom speculation, the guiding line of experience, never abandons, and anyone who. . . .' The corrected version was duly printed in the *GS*, but the editors of the *GW*, evidently unaware of the existence of the erratum slip, have unfortunately restored the original corrupt text.]

LETTER TO THE BURGOMASTER OF PŘÍBOR[1]

(1931)

[259] I offer my thanks to the Burgomaster of the town of Příbor-Freiberg,[2] to the organizers of this celebration and to all those who are attending it, for the honour they have done me in marking the house of my birth with this commemorative tablet from an artist's hand – and this during my lifetime and while the world around us is not yet agreed in its estimate of my work.

I left Freiberg at the age of three and visited it when I was sixteen, during my school holidays, as a guest of the Fluss family,[3] and I have never returned to it again. Since that time much has befallen me; my labours have been many, I have experienced some suffering and happiness as well, and I have had a share of success – the common medley of human life. At seventy-five it is not easy for me to put myself back into those early times; of their rich experiences but few relics remain in my memory. But of one thing I can feel sure: deeply buried within me there still lives the happy child of Freiberg, the firstborn son of a youthful mother, who received his first indelible impressions from this air, from this soil. Thus I may be allowed to end my words of thanks with a heart-felt wish for the happiness of this place and of those who live in it.

1 ['Brief an den Bürgermeister der Stadt Příbor.' *Psychoan. Beweg.*, **3** (6) (1931), 566; *GS*, **12** (1934), 414; *GW*, **14** (1948), 561. The present translation, the first into English, is by James Strachey; it is reprinted here from *SE*, **21** (1961), 259. – On October 25, 1931, a bronze tablet was unveiled by the Burgomaster of Příbor on the wall of the house in which Freud was born. (See Frontispiece.) The present letter was read on that occasion by Anna Freud. An account of the event is given by Ernest Jones (1957, 172).]

2 [The town of Příbor is in Moravia, now part of The Czech Republic. At the time of Freud's birth in 1856 it was known as Freiberg and was included in the Austro-Hungarian Empire.]

3 [This visit was probably the occasion of the apparently autobiographical episode ascribed to an anonymous character in Freud's early paper on 'Screen Memories' (1899*a*), *RSE*, **3**, 300 ff. The boy's age is given there as seventeen, possibly for purposes of disguise.]

LETTER TO GEORG FUCHS[1]

(1931)

After reading your letter I felt a wave of the deepest sympathy, but it [22, 251]
was soon halted by two reflections – an internal difficulty and an external obstacle. A sentence from your own preface offers me an apt expression of the former: 'No doubt, however, there are people who have so poor an opinion of the civilized humanity of today that they deny the existence of a world conscience.' I believe I am one of those people. For instance, I could not subscribe to the assertion that the treatment of convicted prisoners is a disgrace to our civilization. On the contrary, a voice would tell me, it is in perfect harmony with our civilization, a necessary expression of the brutality and lack of understanding which dominate the civilized humanity of the present time. And if by some miracle people suddenly became convinced that the reform of the penal system is the first and most urgent task before our civilization, what else would emerge than that capitalist society has not now the means for meeting the expenditure which that reform would demand? The second, the external, difficulty is brought to light in the passages in your letter in which you exalt me into a recognized intellectual leader and cultural innovator and attribute to me the privilege of having the [22, 252]
ear of the civilized world. I only wish, my dear Sir, that it were so: I should not in that case refuse your request. But it seems to me that I am *persona ingrata*, if not *ingratissima*, with the German people – and moreover with the learned and the unlearned alike. I hope most

1 [In *Wir Zuchthäusler* [We Convicts] by Georg Fuchs, Munich, Langen, 1931, x–xi. Reprinted in K. R. Eissler, 'A Hitherto Unnoticed Letter by Sigmund Freud', *Int. J. Psycho-Anal.*, **42** (1961), 199–200. English translation by K. R. Eissler, loc. cit. The present is a new translation by James Strachey, reprinted from *SE*, **22** (1964), 251 f. The letter was discovered by K. R. Eissler, who very kindly drew our attention to it and gave us permission to use it. A full account of the circumstances of Freud's writing the letter can be found in Eissler's paper referred to above. What follows is based on it.

Georg Fuchs (1868–1949) was a well-known literary critic in Munich, with specially close connections with the theatre. He was imprisoned for political offences and wrote a long account of his experiences as a convict. Before publishing the book he sent copies of it to various celebrities (including Ricarda Huch, Hermann Keyserling and Oswald Spengler as well as Freud) and printed their replies as a preface to the volume.]

positively that you will not think that I feel seriously aggrieved by these signs of disapproval. It is tens of years since I have been so foolish; measured by your example, moreover, it would be too ridiculous. I only mention these trivialities to confirm the fact that I am no desirable advocate for a book which seeks to kindle its readers' sympathies on behalf of a good cause. Let me add that your book is a moving one, noble, wise and good.

LETTER TO JULIUS TANDLER[1]

(1931)

I refer to your statement in the *Neue Freie Presse* that the only effective way of organizing the 'Winter Aid' would be to forward contributions to a central office. Your judgement in this must be definitive for us, and your assurance that this office will be non-partisan and non-denominational should inspire in us the confidence that such an institution requires.

As to the method of collecting for the 'Winter Aid', I take the liberty of proposing a procedure which could be described as *daily self-taxation of those in work*. I pledge myself, as an example, to forfeit for purposes of the 'Winter Aid' an amount of 20 Schillings from the earnings of every day – that is, daily, except for Sundays and periods of illness that may occur – for as long as this institution continues to operate. It would be advantageous for the amount that is accumulated in this way to be collected from the contributors' homes, weekly, at a specific time. This spares them from the repeated making of resolutions, which is not conducive to giving.

Of course, what a single citizen of no great means can achieve may be insignificant. However, if my proposal seems viable to you, please treat it as your own and recommend it to the public. Your great influence will hopefully induce many others to take up the suggestion to contribute in this manner to the 'Winter Aid' for our city of Vienna.

1 [During a period of widespread unemployment in Vienna in the 1930s, a non-partisan municipal campaign for the relief of the needy, called the *Winterhilfe* ('Winter Aid'), was planned. Suggestions as to how the organization behind the campaign might best be funded were submitted to the newspapers by civic-minded residents. Special notice was taken of Freud's submission, addressed to Professor Julius Tandler, the city councillor in charge of the campaign. The letter was published (with Freud's permission) in *Die Neue Freie Presse*, on November 29, 1931, p. 13. It was reprinted in *Die Presse* on November 29, 1980, and in *GW*, **Nachtr**. (1987), 719. An English translation by Ruth & Kurt Eissler was published, with extensive commentary, in 1983 in the *Int. Rev. Psychoan.*, **10**, 3. The present translation by Mark Solms is entirely new. – Freud's plan, like most of the numerous suggestions published at the time, was never carried out.]

BIBLIOGRAPHY

[Titles of books and periodicals are in italics; titles of papers are in inverted commas. Abbreviations are in accordance with the *World List of Scientific Periodicals* (London, 1963–5). Further abbreviations used in this volume can be found in the List at the end of this bibliography. Numerals in bold type refer to volumes; ordinary numerals refer to pages. In the case of the Freud entries, the letters attached to the dates of publication are in accordance with the corresponding entries in the complete bibliography of Freud's writings in the last volume of the *Revised Standard Edition*.

*Sigmund Freud in 1929 (*aet. *73)*

'Now everything has changed. The time before me is limited. The whole of it is no longer spent in working, so that my opportunities for making fresh observations are not so numerous. If I think I see something new, I am uncertain whether I can wait for it to be confirmed. And further, everything that is to be seen upon the surface has already been exhausted; what remains has to be slowly and laboriously dragged up from the depths.' (*RSE*, **19**, 250.)

NOTE ON THE REVISED TRANSLATION

The translations in this *Revised Standard Edition* are supplemented by four sets of notes:

(1) Lengthy commentaries on the English renditions of technical terms that are considered controversial are provided in Volume 24. Usually at the first appearance of each such technical term in each text, but sometimes in other places where the issue seems relevant, the original German word is interpolated in square brackets and a superscript upper-case [T] indicates that the term is discussed in the 24th volume. There (on pp. 55–99) the commentaries appear, in alphabetical order, under the heading 'Notes on the Translation of Some Technical Terms'. If the technical term appears in a derivate form in the text, the root word (as it appears in Volume 24) is provided in the margin. For example, if the interpolated word is the derivative [*überträgt*], the root technical term *Übertragung* appears in the margin.

(2) Shorter commentaries on the English rendition of specific words or phrases appearing in particular places (as opposed to general technical terms) that have attracted comment in the secondary literature are also provided in Volume 24. These minor commentaries are distinguished from those concerning general technical terms by the use of a superscript lower-case [t] in the place where the controversial translation appears. The corresponding set of annotations appears on pp. 105–33 of Volume 24, in chronological order, under the heading 'Annotations to Individual Translations'.

(3) Further interpolations in the translations of German words in square brackets are provided *ad hoc*, without superscript letters, for reasons that should be self-explanatory in each instance. For example, if a technical term which was referenced and discussed in a Note in Volume 24 appears again shortly afterwards in a way that illuminates the points discussed there, then it is silently referenced again. Some of these interpolations might seem odd to German-speaking readers, since no attempt is made to 'adjust' Freud's grammar to conform with the English translation (see the Preface to the Revised Edition, *RSE*, **1**, xxvi *n*. 1). The words in square brackets interpolated in the text are always exactly what Freud wrote.

(4) In a good few places, commentaries (of both types 1 and 2) are also provided in the Editors' introductory notes, appendices and footnotes to the text itself. These are indexed in Volume 24, on pp. 601–6, under the heading 'Notes on Terms and Their Uses'. Such commentaries are usually reserved for matters of translation that are likely to be of interest or value to the general reader, as opposed to those with a special interest in such technical matters.

The pagination of the original *Standard Edition* is provided also in the margins, in square brackets, to assist cross-referencing.

For the reasons explained in the 'Preface to the Revised Edition' (*RSE*, **1**, xxix), all differences between the *SE* and *RSE* are identified through light underscoring of the text. This device was considered necessary to make readers aware of the subtle and pervasive revisions of the translations. The same applies to the revisions of the editorial apparatus. This underscoring will hopefully be removed in later editions of the *RSE*, once the revised edition has become established as the canonical one.

The overarching policy here has been to underscore all differences between the *SE* and *RSE*, with minimal exceptions, in order to ensure transparency. The three categories of exceptions (i.e. the differences that are *not* underscored) are (a) changes that are purely typographical and/or absolutely stereotyped across Volumes 1–23, (b) changes in the location of Freud texts within or between volumes, and (c) all the changes to Volume 24.

The rationale behind (a) is that we wanted to avoid any subjective judgements by the Editor of the *RSE* as to what is and what is not 'significant'. For example, some but not all readers might consider alterations to Strachey's spelling, grammar and punctuation to be trivial, but the potential significance – however subtle – varies with context. The rationale behind (b) is that these changes are indicated in the 'List of Relocated Freud Material in the Revised Edition', which is provided in Volume 24. These changes are also mentioned in the revised (and therefore underscored) editorial notes to the texts themselves. The rationale behind (c) is that the *RSE* version of Volume 24 is so utterly different from the *SE* version that readers can safely consider the volume as a whole to be new.

The following changes were deemed purely typographical and absolutely stereotyped, and are therefore exempted from underscoring:

(1) Changes in type-size, font and spacing (since they are objectively insignificant).

(2) The marginalia – including page numbers – and the superscript ^{T}s and ^{t}s (since they always represent changes).

(3) Changed page numbers in the cross-references and indexes (this follows logically from point 2).

(4) Altered footnote numbers (since new footnotes are always identified by the fact that the notes themselves are underscored, and the knock-on effects for numbering are objectively insignificant).

(5) Changes in running headings (since they repetitively echo changes that are underscored in the main body of text).

(6) Change from the singular possessive 'Editor's' to the plural 'Editors'' (since this applies throughout and follows logically from the fact that, unlike the *SE*, the *RSE* has two editors). In the few instances where the Editor is referred to in the singular, it is always clear from the context whether this means Strachey or Solms or, in the case of Freud (1985*a* [1915]), Grubrich-Simitis.

(7) This preliminary 'Note on the Revised Translation' (since it is obviously added; it applies only to the *RSE*).

(8) Captions to the illustrations (since they always represent changes).

(9) Changes in editorial style (since they are stereotyped and therefore need only be identified once, namely here):

- The word 'and' in two-author citations becomes '&', and a comma is inserted between author name/s and the publication date (e.g. Freud & Breuer, 1895*d*).
- Abbreviations of months (e.g. 'Oct.') and chapters ('Chap.') are spelt out ('October', 'Chapter').
- '*The*' is added to all editorial references to '*Interpretation of Dreams*'.
- Title abbreviations conform to modern usage (e.g. *G.W.* becomes *GW*).
- Punctuation is positioned inside closing quotation marks (e.g. 'The Latin word slipped your memory.').

(10) Modernized hyphenation of words is underscored, but not for those terms that occur very repetitively in the text (since they are stereotyped and the list is limited enough for readers to memorize). Here is the list, which implies also the plural and other grammatical forms of these terms:

anxiety-dream	*becomes*	anxiety dream
anxiety-hysteria	*becomes*	anxiety hysteria
day-dream	*becomes*	daydream
death-wish	*becomes*	death wish
dream-content	*becomes*	dream content
dream-interpretation	*becomes*	dream interpretation
dream-thought	*becomes*	dream thought
ego-cathexis	*becomes*	ego cathexis
ego-libido	*becomes*	ego libido
love-object	*becomes*	love object
object-cathexis	*becomes*	object cathexis
object-choice	*becomes*	object choice
object-libido	*becomes*	object libido
object-love	*becomes*	object love
object-presentation	*becomes*	object presentation
object-relation	*becomes*	object relation
psycho-analysis	*becomes*	psychoanalysis
sound-presentation	*becomes*	sound presentation
super-ego	*becomes*	superego
thing-presentation	*becomes*	thing presentation
to-day	*becomes*	today
wish-fulfilment	*becomes*	wish fulfilment
word-presentation	*becomes*	word presentation

1973 *PFL*, **2**, 33–219. (Reprint of above.)
Introductory Lectures on Psychoanalysis: New Series
2003 *PMC*, *An Outline of Psychoanalysis*, 1–172. (Tr. Helena Ragg-Kirkby.)

The present translation is a revised and corrected reprint of the *SE* version.

Parts of Lectures XXX and XXXI of the original were included in *Almanach 1933* (9–30 and 35–58); and part of Lecture XXXIV in *Psychoan. Beweg.*, **4** (November–December, 1932), 481–97. Lecture XXX, in the English translation of 1933, was included in Devereux, *Psychoanalysis and the Occult* (New York, 1953), 91–109. A résumé written by Freud himself of the beginning part of Lecture XXX appeared in a Hungarian translation in the issue of *Magyar Hírlap*, Budapest, of December 25, 1932 (Freud, 1932*d*).

We learn from Ernest Jones (1957, 186–7) that, although the volume was dated '1933' on its title page, it was actually published on December 6, 1932 – thus repeating the history of *The Interpretation of Dreams* (see below, p. 231).

In the early part of 1932 the financial affairs of the psychoanalytic publishing business (the '*Verlag*') were in a parlous state, and the idea occurred to Freud of coming to its help with a new series ('*Neue Folge*' in the German title) of

Introductory Lectures. The first and last lectures were ready by the end of May and the whole book was finished by the end of August.

These lectures differ from the original set in several ways, and not merely in the fact that they were never meant to be delivered. As Freud points out in his own
[4] Preface, they do not stand on their own legs but are essentially supplements. What is especially noticeable about them, however, is the way in which they differ in character among themselves. The first lecture, on dreams, is almost nothing more than a summary of the dream section in the earlier series. On the other hand, the third, fourth and fifth lectures (on the structure of the mind, on anxiety and the theory of the drives, and on female psychology) introduce entirely new material and theories and, at all events in the case of the third and fourth lectures, plunge into metapsychological and theoretical discussions of a difficulty which had been studiously avoided fifteen years earlier. The remaining three lectures – the second and the last two – deal with a number of miscellaneous topics only indirectly related to psychoanalysis and deal with them, moreover, in what might almost be described as a popular manner. This is not to suggest that they are uninteresting – far from it – but they demand a very different kind and degree of attention from readers than do their fellows. Whether readers wish to hear what Freud thinks about telepathy, education, religion and Communism, or whether they wish to learn Freud's later views on the superego, on anxiety, on the death drive and on the pre-Oedipus phase in girls, they will certainly find plenty to occupy them in these lectures.

PREFACE

My *Introductory Lectures on Psychoanalysis* were delivered during the [5]
two winter terms of 1915–16 and 1916–17 in a lecture room of the Vienna Psychiatric Clinic before an audience gathered from all the faculties of the University. The first half of the lectures were improvised, and written out immediately afterwards; drafts of the second half were made during the intervening summer vacation at Salzburg, and delivered word for word in the following winter. At that time I still possessed the gift of a phonographic memory.

These new lectures, unlike the former ones, have never been delivered. My age had in the meantime absolved me of the obligation of giving expression to my membership of the University (which was in any case a peripheral one) by delivering lectures; and a surgical operation had made speaking in public impossible for me. If, therefore, I once more take my place in the lecture room during the remarks that follow, it is only by an artifice of the imagination [*Phantasie*][T]; it may help me not to forget to bear the reader in mind as I enter more deeply into my subject.

The new lectures are by no means intended to take the place of the earlier ones. They do not in any sense form an independent entity with an expectation of finding a circle of readers of its own; they are continuations and supplements, which, in relation to the former series, fall into three groups. A first group contains fresh treatments of subjects which were already dealt with fifteen years ago but which, as a result of a deepening of our knowledge and an alteration in our views, call for a different exposition today – that is to say, critical revisions. The two other groups contain what are true extensions, for they deal with things which either did not exist in psychoanalysis at the time of the first lectures or which were too little in evidence to justify a special chapter heading. It is inevitable, but not to be regretted, if some of the new lectures unite the characteristics of more than one of these groups.

I have also given expression to the dependence of these new lectures

on the *Introductory Lectures* by giving them a numbering continuous
[6] with theirs. The first lecture in this volume is accordingly called No. XXIX. Like their predecessors, they offer the professional analyst little that is new; they are addressed to the multitude of educated people to whom we may perhaps attribute a benevolent, even though cautious, interest in the characteristics and discoveries of the young science. This time once again it has been my chief aim to make no sacrifice to an appearance of being simple, complete or rounded off, not to disguise
Verleugnung problems and not to deny [*verleugnen*]^{T} the existence of gaps and uncertainties. In no other field of scientific work would it be necessary to boast of such modest intentions. They are universally regarded as self-evident; the public expects nothing else. No reader of an account of astronomy will feel disappointed and contemptuous of the science if he is shown the frontiers at which our knowledge of the universe melts into haziness. Only in psychology is it otherwise. There mankind's constitutional unfitness for scientific research comes fully into the open. What people seem to demand of psychology is not progress in knowledge, but satisfactions of some other sort; every unsolved problem, every admitted uncertainty is made into a reproach against it.

Seele Whoever cares for the science of mental life [*Seelenleben*]^{T} must accept these injustices along with it.

FREUD

Vienna, Summer, 1932

LECTURE XXIX

REVISION OF THE THEORY OF DREAMS

Ladies and Gentleman, if, after an interval of more than fifteen years, I [7]
have brought you together again to discuss with you what novelties, and what improvements it may be, the intervening time has introduced into psychoanalysis, it is right and fitting from more than one point of view that we should turn our attention first to the position of the theory of dreams. It occupies a special place in the history of psychoanalysis and marks a turning point; it was with it that analysis took the step from being a psychotherapeutic procedure to being a depth psychology. Since then, too, the theory of dreams has remained what is most characteristic and peculiar about the young science, something to which there is no counterpart in the rest of our knowledge, a stretch of new country, which has been reclaimed from popular beliefs and mysticism. The strangeness of the assertions it was obliged to put forward has made it play the part of a shibboleth, the use of which decided who could become a follower of psychoanalysis and to whom it remained for ever incomprehensible. I myself found it a sheet-anchor during those difficult times when the unrecognized facts of the neuroses used to confuse my inexperienced judgement. Whenever I began to have doubts of the correctness of my wavering conclusions, the successful transformation of a senseless and muddled dream into a logical and intelligible mental process in the dreamer would renew my confidence of being on the right track.

It is therefore of special interest to us, in the particular instance of the theory of dreams, on the one hand to follow the vicissitudes [*Wandlungen*] through which psychoanalysis has passed during this interval, and on the other hand to learn what advances it has made in being understood and appreciated by the contemporary world. I may tell you at once that you will be disappointed in both these directions.

Let us look through the volumes of the *Internationale Zeitschrift für (ärztliche) Psychoanalyse* [*International Journal of (Medical) Psychoanalysis*], in which, since 1913, the authoritative writings in our field of [8]

work have been brought together. In the earlier volumes you will find a recurrent sectional heading 'On Dream Interpretation' [*'Zur Traumdeutung'*][T], containing numerous contributions on various points in the theory of dreams. But the further you go the rarer do these contributions become, and finally the sectional heading disappears completely. The analysts behave as though they had no more to say about dreams, as though there was nothing more to be added to the theory of dreams. But if you ask how much of dream interpretation has been accepted by outsiders – by the many psychiatrists and psychotherapists who warm their pot of soup at our fire (incidentally without being very grateful for our hospitality), by what are described as educated people, who are in the habit of assimilating the more striking findings of science, by the literary men and by the public at large – the reply gives little cause for satisfaction. A few formulas have become generally familiar, among them some that we have never put forward – such as the thesis that all dreams are of a sexual nature – but really important things like the fundamental distinction between the manifest content of dreams and the latent dream thoughts, the realization that the wish-fulfilling function of dreams is not contradicted by anxiety dreams [*Angstträume*][T], the impossibility of interpreting a dream unless one has the dreamer's associations to it at one's disposal, and, above all, the discovery that what is essential in dreams is the process of the dream-work – all this still seems about as foreign to general awareness as it was thirty years ago. I am in a position to say this, since in the course of that period I have received innumerable letters whose writers present their dreams for interpretation or ask for information about the nature of dreams and who declare that they have read my *Interpretation of Dreams*, though in every sentence they betray their lack of understanding of our theory of dreams. But all this shall not deter us from once more giving a connected account of what we know about dreams. You will recall that last time we devoted a whole number of lectures to showing how we came to understand this hitherto unexplained mental phenomenon.[1]

Deutung

Angst

[9] Let us suppose, then, that someone – a patient in analysis, for instance – tells us one of his dreams. We shall assume that in this way he is making us one of the communications to which he has pledged himself by the fact of having started an analytic treatment. It is, to be sure, a communication made by inappropriate means, for dreams are not in

1 [Cf. the whole of Part II of *Introductory Lectures on Psychoanalysis* (1916–17*a*), *RSE*, **15**, 73 ff.]

themselves social utterances, not a means of giving information. Nor, indeed, do we understand what the dreamer was trying to say to us, and he himself is equally in the dark. And now we have to make a quick decision. On the one hand, the dream may be, as non-analytic doctors assure us, a sign that the dreamer has slept badly, that not every part of his brain has come to rest equally, that some areas of it, under the influence of unknown stimuli, endeavoured to go on working but were only able to do so in a very incomplete fashion. If that is the case, we shall be right to concern ourselves no further with the product of a nocturnal disturbance which has no psychical value: for what could we expect to derive from investigating it that would be of use for our purposes? Or on the other hand – but it is plain that we have from the first decided otherwise. We have – quite arbitrarily, it must be admitted – made the assumption, adopted as a postulate, that even this unintelligible dream must be a fully valid psychical act, with sense and worth, which we can use in analysis like any other communication. Only the outcome of our experiment can show whether we are right. If we succeed in turning the dream into an utterance of value of that kind, we shall evidently have a prospect of learning something new and of receiving communications of a sort which would otherwise be inaccessible to us.

Now, however, the difficulties of our task and the enigmas of our subject rise before our eyes. How do we propose to transform the dream into a normal communication and how do we explain the fact that some of the patient's utterances have assumed a form that is unintelligible both to him and to us?

As you see, ladies and gentlemen, this time I am taking the path not of a genetic [*genetischen*][T] but of a dogmatic exposition. Our first step is to establish our new attitude to the problem of dreams by introducing two new concepts and names. What has been called the dream we shall describe as the text of the dream or the *manifest* dream, and what we are looking for, what we suspect, so to say, of lying behind the dream, we shall describe as the *latent* dream thoughts. Having done [10] this, we can express our two tasks as follows. We have to transform the manifest dream into the latent one, and to explain how, in the dreamer's mind, the latter has become the former. The first portion is a *practical* task, for which dream interpretation is responsible; it calls for a technique. The second portion is a *theoretical* task, whose business it is to explain the hypothetical dream-work; and it can only be a theory. Both of them, the technique of dream interpretation and the theory of the dream-work, have to be newly created.

With which of the two, then, shall we start? With the technique of dream interpretation, I think; it will present a more concrete appearance and make a more vivid impression on you.

Well then, the patient has told us a dream, which we are to interpret. We have listened passively, without putting our powers of reflection into action.[1] What do we do next? We decide to concern ourselves as little as possible with what we have heard, with the *manifest* dream. Of course, this manifest dream exhibits all sorts of characteristics which are not entirely a matter of indifference to us. It may be coherent, smoothly constructed like a literary composition, or it may be confused to the point of unintelligibility, almost like a delirium; it may contain absurd elements or jokes and apparently witty conclusions; it may seem to the dreamer clear and sharp or obscure and hazy; its pictures may exhibit the complete sensory strength of perceptions or may be shadowy like an indistinct mist; the most diverse characteristics may be present in the same dream, distributed over various portions of it; the dream, finally, may show an indifferent emotional tone or be accompanied by feelings of the strongest joy or distress. You must not suppose that we think nothing of this endless diversity in manifest dreams. We shall come back to it later and we shall find a great deal in it that we can make use of in our interpretations. But for the moment we will disregard it and follow the main road that leads to the interpretation of dreams. That is to say, we ask the dreamer, too, to free himself from the impression of the
[11] manifest dream, to divert his attention from the dream as a whole on to the separate portions of its content and to report to us in succession
Einfall everything that occurs to him [*einfällt*][T] in relation to each of these portions – what associations [*Assoziationen*] present themselves to him if he focuses on each of them separately.

That is a curious technique, is it not? – not the usual way of dealing with a communication or utterance. And no doubt you guess that behind this procedure there are assumptions which have not yet been expressly stated. But let us proceed. In what order are we to get the patient to take up the portions of his dream? There are various possibilities open to us. We can simply follow the chronological order in which they appeared in the account of the dream. That is what may be called the strictest, classical method. Or we can direct the dreamer to begin by looking out for the 'day's residues' in the dream; for experience has

1 [Some illuminating remarks on reflection can be found, in a similar connection, in Chapter II of *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 90–1.]

taught us that almost every dream includes the remains of a memory or an allusion to some event (or often to several events) of the day before the dream, and, if we follow these connections, we often arrive with one blow at the transition from the apparently far remote dream world to the real life of the patient. Or, again, we may tell him to start with those elements of the dream's content which strike him by their special clarity and sensory strength; for we know that he will find it particularly easy to get associations to these. It makes no difference by which of these methods we approach the associations we are in search of.[1]

And next, we obtain these associations [*Assoziationen*]. What they bring us is of the most various kinds: memories from the day before, the 'dream day', and from times long past, reflections, discussions, with arguments for and against, confessions and enquiries. Some of them the patient pours out; when he comes to others he is held up for a time. Most of them show a clear connection to some element of the dream; no wonder, since those elements were their starting point. But it also sometimes happens that the patient introduces them with these words: 'This seems to me to have nothing at all to do with the dream, but I tell it you because it occurs [*einfällt*] to me.'

If one listens to these copious associations [*Einfällen*], one soon [12] notices that they have more in common with the content of the dream than their starting points alone. They throw a surprising light on all the different parts of the dream, fill in gaps between them, and make their strange juxtapositions intelligible. In the end one is bound to become clear about the relation between them and the dream's content. The dream is seen to be an abbreviated selection from the associations [*Assoziationen*], a selection made, it is true, according to rules that we have not yet understood: the elements of the dream are like representatives chosen by election from a mass of people. There can be no doubt that by our technique we have got hold of something for which the dream is a substitute and in which lies the dream's psychical value, but which no longer exhibits its puzzling peculiarities, its strangeness and its confusion.

Let there be no misunderstanding, however. The associations to the dream are not yet the latent dream thoughts. The latter are contained in the associations like an alkali in the mother-liquor, but yet not quite completely contained in them. On the one hand, the associations give us far more than we need for formulating the latent dream

1 [A slightly different list of these alternative methods is given in 'Remarks on the Theory and Practice of Dream Interpretation' (1923*c*), *RSE*, **19**, 99.]

thoughts – namely all the explanations, transitions and connections which the patient's intellect is bound to produce in the course of his approach to the dream thoughts. On the other hand, an association often comes to a stop precisely before the genuine dream thought: it has only come near to it and has only had contact with it through allusions. At that point we intervene on our own; we fill in the hints, draw undeniable conclusions, and give explicit utterance to what the patient has only touched on in his associations. This sounds as though we allowed our ingenuity and caprice to play with the material put at our disposal by the dreamer and as though we misused it in order to interpret *into* his utterances what cannot be interpreted *from* them. Nor is it easy to show the legitimacy of our procedure in an abstract description of it. But you have only to carry out a dream analysis yourselves or study a good account of one in our literature and you will be convinced of the cogent manner in which interpretative work like this proceeds.

If, in general and primarily, we are dependent, in interpreting dreams,
[13] on the dreamer's associations, yet in relation to certain elements of the dream's content we adopt a quite independent attitude, it is chiefly because we have to, because as a rule associations fail to materialize in their case. We noticed at an early stage that it is always in connection with the same elements that this happens; they are not very numerous, and repeated experience has taught us that they are to be regarded and interpreted as *symbols* of something else. As contrasted with the other dream elements, a fixed meaning may be attributed to them, which, however, need not be unambiguous and whose range is determined by special rules with which we are unfamiliar. Since *we* know how to trans-
Übersetzung late [*übersetzen*][T] these symbols and the dreamer does not, in spite of having used them himself, it may happen that the sense of a dream may at once become clear to us as soon as we have heard the text of the dream, even before we have made any efforts at interpreting it, while it still remains an enigma to the dreamer himself. But I have said so much to you in my earlier lectures about symbolism, our knowledge of it and the problems it poses us, that I need not repeat it today.[1]

That, then, is our method of interpreting dreams. The first and justifiable question is: 'Can we interpret *all* dreams by its help?'[2] And the answer is: 'No, not all; but so many that we feel confident in the serviceability and correctness of the procedure.' 'But why not all?' The answer

1 [See *Introductory Lectures* (1916–17*a*), Lecture X; *RSE*, **15**, 130 ff.]

2 [Freud had recently written a special note on 'The Limits to the Possibility of Interpretation' (1925*i*), ibid., **19**, 115 ff.]

to this has something important to teach us, which at once introduces us into the psychical determinants of the formation of dreams: 'Because the work of interpreting dreams is carried out against a resistance, which varies between trivial dimensions and invincibility (at least so far as the strength of our present methods reaches).' It is impossible during our work to overlook the manifestations of this resistance. At some points the associations are given without hesitation and the first or second idea that occurs to the patient brings an explanation. At other points there is a stoppage and the patient hesitates before bringing out an association, and, if so, we often have to listen to a long chain of ideas before receiving anything that helps us to understand the dream. We are certainly right in thinking that the longer and more roundabout the chain of associations the stronger the resistance. We can detect the same influence at work in the forgetting of dreams. It happens often enough that a patient, despite all his efforts, cannot remember one of his dreams. But after we have been able in the course of a piece of analytic work to get rid of a difficulty which had been disturbing his relation to the analysis, the forgotten dream suddenly re-emerges. Two other observations are also in place here. It very frequently comes about that, to begin with, a portion of a dream is omitted and added afterwards as an addendum. This is to be regarded as an attempt to forget that portion. Experience shows that it is that particular piece which is the most important; there was a greater resistance, we suppose, in the path of communicating it than the other parts of the dream.[1] Furthermore, we often find that a dreamer endeavours to prevent himself from forgetting his dreams by fixing them in writing immediately after waking up. We can tell him that that is no use. For the resistance from which he has extorted the preservation of the text of the dream will then be displaced [*verschiebt*][T] on to its associations and will make the manifest dream inaccessible to interpretation.[2] In view of these facts we need not feel surprised if a further increase in the resistance suppresses the associations altogether and thus brings the interpretation of the dream to nothing.

[14]

Verschiebung

From all this we infer that the resistance which we come across in the work of interpreting dreams must also have had a share in their origin. We can actually distinguish between dreams that arose under a slight and under a high pressure of resistance.[3] But this pressure varies as well

1 [Cf. *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 463–4.]

2 [Cf. 'The Handling of Dream Interpretation in Psychoanalysis' (1911*e*), ibid., **12**, 87.]

3 [Cf. Section II of 'Remarks on the Theory and Practice of Dream Interpretation' (1923*c*), ibid., **19**, 100.]

from place to place within one and the same dream; it is responsible for the gaps, obscurities and confusions which may interrupt the continuity of even the finest of dreams.

But what is creating the resistance and against what is it aimed? Well, the resistance is the surest sign to us of a conflict. There must be a force [*Kraft*][T] here which is seeking to express something and another which
[15] is striving to prevent its expression. What comes about in consequence as a manifest dream may combine all the decisions into which this struggle between two trends has been condensed. At one point one of these forces may have succeeded in putting through what it wanted to say, while at another point it is the opposing agency which has managed to blot out the intended communication completely or to replace it with something that reveals not a trace of it. The commonest and most
Bildung characteristic cases of dream construction [*Traumbildung*][T] are those in which the conflict has ended in a compromise, so that the communicating agency has, it is true, been able to say what it wanted but not in the way it wanted – only in a softened-down, distorted and unrecognized form. If, then, dreams do not give a faithful picture of the dream thoughts and if the work of interpretation is required in order to bridge the gap between them, that is the outcome of the opposing, inhibiting
Hemmung [*hemmenden*][T] and restricting agency which we have inferred from our perception of the resistance while we interpret dreams. So long as we studied dreams as isolated phenomena independent of the psychical structures [*Bildungen*] akin to them, we named this agency the *censor*[1] *of dreams.*

You have long been aware that this censorship is not an institution peculiar to dream life. You know that the conflict between the two psychical agencies, which we – inaccurately – describe as the 'unconscious repressed' [*Verdrängte*][T] and the 'conscious', dominates our
Verdrängung whole mental life and that the resistance against the interpretation of dreams, the sign of the dream censorship, is nothing other than the resistance due to repression by which the two agencies are separated. You know, too, that the conflict between these two agencies may under certain conditions produce other psychical structures which, like dreams, are the outcome of compromises; and you will not expect me to repeat to you here everything that was contained in my introduction to the theory of the neuroses in order to demonstrate to you what we

1 [This is one of the very rare occasions on which Freud uses the personified form '*Zensor*' instead of the impersonal '*Zensur*' (censorship). See an Editors' footnote in *Introductory Lectures*, XXVI; *RSE*, **16**, 378 *n.* 3.]

know of the determinants of the formation of such compromises. You have realized that the dream is a pathological product, the first member of the class which includes hysterical symptoms, obsessions [*Zwangsvorstellung*][T] and delusions,[1] but that it is distinguished from the others by its transitoriness and by its occurrence under conditions which are part of normal life. For let us bear firmly in mind that, as was already pointed out by Aristotle, dream life is the way in which our mind works during the state of sleep.[2] The state of sleep involves a turning away from the real external world, and there we have the necessary condition for the development of a psychosis. The most careful study of the severe psychoses will not reveal to us a single feature that is more characteristic of those pathological conditions. In psychoses, however, the turning away from reality is brought about in two kinds of way: either by the unconscious repressed becoming excessively strong so that it overwhelms the conscious, which is attached to reality,[3] or because reality has become so intolerably distressing that the threatened ego [*Ich*][T] throws itself into the arms of the unconscious drive forces [*Triebhaften*][T] in a desperate revolt. The harmless dream psychosis is the result of a withdrawal from the external world which is consciously willed and only temporary, and it disappears when relations to the external world are resumed. During the isolation of the sleeping individual an alteration in the distribution of his psychical energy also sets in; a part of the expenditure on repression, which is normally required in order to hold the unconscious down, can be saved, for if the unconscious makes use of its relative liberation for active purposes, it finds its path to motility closed and the only path open to it is the harmless one leading to hallucinatory satisfaction. Now, therefore, a dream can be formed; but the fact of the dream censorship shows that even during sleep enough of the resistance due to repression is retained. [16] *Trieb*

Here we are presented with a means of answering the question of whether dreams have a function too, whether they are entrusted with any useful achievement. The condition of rest free from stimulus, which the state of sleep wishes to establish, is threatened from three directions: in a relatively accidental manner by external stimuli during sleep, and by interests of the previous day which cannot be broken off, and in an unavoidable manner by unsated repressed drive impulses [17]

1 [This part of the sentence is repeated almost word for word from the second sentence in Freud's Preface to the first edition of *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, xxvii.]

2 [*The Interpretation of Dreams*, ibid., **4**, 2.]

3 [The notion occurs already in one of Freud's very earliest psychological papers, his first one on 'The Neuropsychoses of Defence' (1894*a*), ibid., **3**, 51 f.]

Regung [*Triebregungen*][T] which are on the watch for an opportunity of finding expression. In consequence of the diminishing of repressions at night there would be a risk that the rest afforded by sleep would be interrupted whenever an instigation from outside or from inside succeeded in linking up with an unconscious drive source. The process of dreaming allows the product of a collaboration of this kind to find an outlet in a harmless hallucinatory experience and in that way assures a continuation of sleep. The fact that a dream occasionally awakens the sleeper, to the accompaniment of a generation of anxiety, is no contradiction of this function but rather, perhaps, a signal that the watchman regards the situation as too dangerous and no longer feels able to control it. And very often then, while we are still asleep, a consolation occurs to us which seeks to prevent our waking up: 'But after all it's only a dream!'

This was what I wanted to say to you, ladies and gentlemen, about dream interpretation, whose task it is to lead the way from the manifest dream to the latent dream thoughts. When this has been achieved, interest in a dream, so far as practical analysis is concerned, is for the most part at an end. We add the communication we have received in the form of a dream to the rest of the patient's communications and proceed with the analysis. We, however, have an interest in dwelling a little longer on the dream. We are tempted to study the process by which the latent dream thoughts were transformed into the manifest dream. We call this the 'dream-work'. As you will recall, I described it in such detail in my earlier lectures[1] that I can restrict my present survey to the most concise summary.

The process of the dream-work, then, is something entirely new and strange, nothing resembling which was known before. It has given us our first glimpse of the processes which take place in the unconscious system and has shown us that they are quite other than what we know from our conscious thinking and are bound to appear to the latter pre-
[18] posterous and incorrect. The importance of this finding was then increased by the discovery that in the construction of neurotic symptoms the same mechanisms (we do not venture to say 'processes of thought') are operative as those which have transformed the latent dream thoughts into the manifest dream.

In what follows I shall not be able to avoid a schematic method of exposition. Let us assume that in a particular case we have before us all the latent thoughts, charged with a greater or lesser amount of

1 [*Introductory Lectures*, XI; *RSE*, **15**, 148 ff.]

affect, by which the manifest dream has been replaced after its interpretation has been completed. We shall then be struck by one difference among these latent thoughts, and that difference will take us a long way. Almost all these dream thoughts are recognized by the dreamer or acknowledged by him; he admits that he has thought this, now or at some other time, or that he might have thought it. There is only one single thought that he refuses to accept; it is strange to him or even perhaps repellent; he may possibly reject it with passionate feeling. It now becomes evident to us that the other thoughts are portions of a conscious, or, more accurately, a preconscious train of thinking. They might have been thought in waking life too, and indeed they were probably formed during the previous day. This one repudiated [*verleugnete*] thought, however, or, properly speaking, this one impulse, is a child of night; it belongs to the dreamer's unconscious and on that account it is repudiated and rejected by him. It had to wait for the nightly relaxation of repression in order to arrive at any kind of expression. And in any case this expression is a weakened, distorted and disguised one; without our work of dream interpretation we should not have found it. This unconscious impulse has to thank its link with the other, unobjectionable, dream thoughts for the opportunity of slipping past the barrier of the censorship in an inconspicuous disguise. On the other hand, the preconscious dream thoughts have to thank this same link for the power [*Macht*][T] to occupy mental life during sleep as well. For there is no doubt about it: this unconscious impulse is the true creator of the dream; it is what produces the psychical energy for the dream's construction. Like any other drive impulse, it cannot strive for anything other than its own satisfaction; and our experience in interpreting dreams shows us too that that is the sense of all dreaming. In every dream a drive wish has to be represented as fulfilled. The shutting off of mental life from reality at night and the regression to primitive mechanisms which this makes possible enable this wished-for drive satisfaction to be experienced in a hallucinatory manner as occurring in the present. As a result of this same regression, ideas are transformed in the dream into visual pictures: the latent dream thoughts, that is to say, are dramatized and illustrated. [19]

This piece of the dream-work gives us information about some of the most striking and peculiar features of dreams. I will repeat the course of events in dream formation. As an introduction: the wish to sleep and intentional turning away from the external world. Next,

two consequences of this for the mental apparatus: first, the possibility for older and more primitive methods of working to emerge in it – regression; secondly, the lowering of the resistance due to repression which weighs down upon the unconscious. As a result of this last factor the possibility arises for the formation of a dream and this is taken advantage of by the precipitating causes, the internal and external stimuli which have become active. The dream which originates in this way is already a compromise structure. It has a double function; on the one hand it is ego-syntonic[I] [*ichgerecht*][T], since, by getting rid of the stimuli which are interfering with sleep, it serves the wish to sleep; on the other hand it allows a repressed drive impulse to obtain the satisfaction that is possible in these circumstances, in the form of the hallucinated fulfilment of a wish. The whole process of forming a dream which is permitted by the sleeping ego is, however, subject to the condition of the censorship, which is exercised by the residue of the repression still in operation. I cannot present the process more simply: it is not more simple. But I can proceed now with my description of the dream-work.

Let us go back once more to the latent dream thoughts. Their most powerful element is the repressed drive impulse which has created in them an expression for itself on the basis of the presence of chance stimuli and by transference on to the day's residues – though an expression that is toned down and disguised. Like every drive impulse, it too presses for satisfaction by action; but its path to motility is blocked by
[20] the physiological regulations implied in the state of sleep; it is compelled to take the backwards course in the direction of perception and to be content with a hallucinated satisfaction. The latent dream thoughts are thus transformed into a collection of sensory images and visual scenes. It is as they travel on this course that what seems to us so novel and so strange occurs to them. All the linguistic instruments by which we express the subtler relations of thought – the conjunctions and prepositions, the changes in declension and conjugation – are dropped, because there are no means of representing them; just as in a primitive language without any grammar, only the raw material of thought is expressed and abstract terms are taken back to the concrete ones that are at their basis. What is left over after this may well appear disconnected. The copious employment of symbols, which have become alien to conscious thinking, for representing certain objects and processes is

1 [In conformity with the ego.]

in harmony alike with the archaic regression in the mental apparatus and with the demands of the censorship.

But other changes made in the elements of the dream thoughts go far beyond this. Such of those elements as allow any point of contact to be found between them are *condensed* [*verdichtet*][T] into new unities. In the process of transforming the thoughts into pictures, preference is unmistakably given to such as permit of this putting together, this condensation; it is as though a force were at work which was subjecting the material to compression and concentration. As a result of condensation, one element in the manifest dream may correspond to numerous elements in the latent dream thoughts; but, conversely too, one element in the dream thoughts may be represented by several images in the dream. *Verdichtung*

Still more remarkable is the other process – *displacement* [*Verschiebung*] or shifting of accent – which in conscious thinking we come across only as faulty reasoning or as means for a joke. The different ideas [*Vorstellungen*][T] in the dream thoughts are, indeed, not all of equal value; they are cathected [*besetzt*][T] with quotas of affect of varying magnitude and are correspondingly judged to be important and deserving of interest to a greater or lesser degree. In the dream-work these ideas are separated from the affects attaching to them. The affects are dealt with independently; they may be displaced on to something else, they may be retained, they may undergo alterations, or they may not appear in the dream at all. The importance of the ideas that have been stripped of their affect returns in the dream as sensory strength in the dream pictures; but we observe that this accent has passed over from important elements to indifferent ones. Thus something that played only a minor part in the dream thoughts seems to be pushed into the foreground in the dream as the main thing, while, on the contrary, what was the essence of the dream thoughts finds only passing and indistinct representation in the dream. No other part of the dream-work is so much responsible for making the dream strange and incomprehensible to the dreamer. Displacement is the principal means used in the *dream distortion* to which the dream thoughts must submit under the influence of the censorship. *Besetzung* [21]

After these influences have been brought to bear upon the dream thoughts the dream is almost complete. A further, somewhat variable, factor also comes into play – known as 'secondary revision' – after the dream has been presented before consciousness as an object of perception. At that point we treat it as we are in general accustomed to treat the contents of our perception: we fill in gaps and introduce

connections, and in doing so are often guilty of gross misunderstandings. But this activity, which might be described as a rationalizing one and which at best provides the dream with a smooth façade that cannot fit its true content, may also be omitted or be expressed to only a very modest degree – in which case the dream will display all its rents and cracks openly. It must not be forgotten, on the other hand, that the dream-work does not always operate with equal energy either; it often restricts itself to certain portions of the dream thoughts only and others of them are allowed to appear in the dream unaltered. In such cases an impression is given of the dream having carried out the most delicate and complex intellectual operations, of its having speculated, made jokes, arrived at decisions and solved problems, whereas all this is a product of our normal mental activity, may have been performed equally well during the day before the dream as during the night, has nothing to do with the dream-work and brings nothing to light that is characteristic of dreams. Nor is it superfluous to insist once more on the contrast within the dream thoughts themselves between the unconscious drive impulse and the day's residues. While the latter exhibit all the
[22] multiplicity of our mental acts, the former, which becomes the motive force [*Motor*] proper of the forming of the dream, finds its outlet invariably in the fulfilment of a wish.

I could have told you all this fifteen years ago, and indeed I believe I did in fact tell it you then. And now let me bring together such changes and new discoveries as may have been made during the interval. I have said already that I am afraid you will find that it amounts to very little, and you will fail to understand why I obliged you to listen to the same thing twice over, and obliged myself to say it. But fifteen years have passed meanwhile and I hope that this will be my easiest way of re-establishing contact with you. Moreover, these are such fundamental things, of such decisive importance for understanding psychoanalysis, that one may be glad to hear them a second time, and it is in itself worth knowing that they have remained so much the same for fifteen years.

In the literature of this period you will of course find a large quantity of confirmatory material and of presentation of details, of which I intend to give you only samples. I shall also, incidentally, be able to tell you a few things that were in fact already known earlier. What is in question is principally the symbolism in dreams and the other methods of representation in them. Now listen to this. Only quite a short while ago the medical faculty in an American university refused to allow

psychoanalysis the status of a science, on the ground that it did not admit of any experimental proof. They might have raised the same objection to astronomy; indeed, experimentation with the heavenly bodies is particularly difficult. There one has to fall back on observation. Nevertheless, some Viennese investigators have actually made a beginning with experimental confirmation of our dream symbolism. As long ago as in 1912 a Dr Schrötter found that, if instructions to dream of sexual matters are given to deeply hypnotized subjects, then in the dream that is thus provoked the sexual material emerges with its place taken by the symbols that are familiar to us. For instance, a woman was told to dream of sexual intercourse with a female friend. In her dream this friend appeared with a travelling-bag on which was pasted the label 'Ladies Only'. Still more impressive experiments were carried out by Betlheim & Hartmann in 1924. They worked with patients suffering [23]
from what is known as the Korsakoff psychosis. They told these patients stories of a grossly sexual kind and observed the distortions which appeared when the patients were instructed to reproduce what they had been told. Once more there emerged the symbols for sexual organs and sexual intercourse that are familiar to us – among them the symbol of the staircase which, as the writers justly remark, could never have been reached by a conscious wish to distort.[1]

In a very interesting series of experiments, Herbert Silberer [1909 and 1912] has shown that one can catch the dream-work red-handed, as it were, in the act of turning abstract thoughts into visual pictures. If he tried to force himself to do intellectual work while he was in a state of fatigue and drowsiness, the thought would often vanish and be replaced by a vision, which was obviously a substitute for it.

Here is a simple example. 'I thought', says Silberer, 'of having to revise an uneven passage in an essay.' The vision: 'I saw myself planing a piece of wood.' It often happened during these experiments that the content of the vision was not the thought that was being dealt with but his own subjective state while he was making the effort – the state instead of the object. This is described by Silberer as a 'functional phenomenon'. An example will show you at once what is meant. The author was endeavouring to compare the opinions of two philosophers on a particular question. But in his sleepy condition one of these opinions kept on escaping him and finally he had a vision that he was asking for information from a disobliging secretary who was bent over

1 [Longer descriptions of these experiments can be found in Chapter VI (E) of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 343 f.]

his writing table and who began by disregarding him and then gave him a disagreeable and uncomplying look. The conditions under which the experiments were made probably themselves explain why the vision that was induced represented so often an event of self-observation.[1]

[24] We have not yet finished with symbols. There are some which we believed we recognized but which nevertheless worried us because we could not explain how *this* particular symbol had come to have *that* particular meaning. In such cases confirmations from elsewhere – from philology, folklore, mythology or ritual – were bound to be especially welcome. An instance of this sort is the symbol of an overcoat or cloak [German '*Mantel*']. We have said that in a woman's dreams this stands for a man.[2] I hope it will impress you when you hear that Theodor Reik (1920*b*) gives us this information: 'During the extremely ancient bridal ceremonial of the Bedouins, the bridegroom covers the bride with a special cloak known as "Aba" and speaks the following ritual words: "Henceforth none save I shall cover thee!"' (Quoted from Robert Eisler [1910, **2**, 599 f.].) We have also found several fresh symbols, at least two of which I will tell you of. According to Abraham (1922*c*) a spider in dreams is a symbol of the mother, but of the *phallic* mother, of whom we are afraid; so that the fear of spiders expresses dread of mother incest and horror of the female genitals. You know, perhaps, that the mythological creation, Medusa's head, can be traced back to the same motif of fright at castration.[3] The other symbol I want to talk to you about is that of the *bridge*, which has been explained by Ferenczi (1921*c* and 1922*b*). First it means the male organ, which unites the two parents in sexual intercourse; but afterwards it develops further meanings which are derived from this first one. Insofar as it is thanks to the male organ that we are able to come into the world at all, out of the amniotic fluid, a bridge becomes the crossing from the other world (the unborn state, the womb) to this world (life); and, since men also picture death as a return to the womb (to the water), a bridge also acquires the meaning of something that leads to death, and finally, at a further remove from its original sense, it stands for transitions or changes in condition

1 [Freud gave a very much fuller account of Silberer's experiments, with a great many quotations, in some passages added in 1914 to *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 308–9 and 450–3.]

2 [The symbol is referred to in the *Introductory Lectures*, ibid., **15**, 136 and 137, but the fact that this applies to *women's* dreams is only mentioned among some 'Observations and Examples' published earlier (Freud, 1913*h*), ibid., **13**, 187.]

3 [Cf. a posthumously published note by Freud on the subject (1940*c* [1922]), ibid., **18**, 265 f.]

generally. It tallies with this, accordingly, if a woman who has not overcome her wish to be a man has frequent dreams of bridges that are too short to reach the further shore.

In the manifest content of dreams we very often find pictures and [25] situations recalling familiar themes in fairy tales, legends and myths. The interpretation of such dreams thus throws a light on the original interests which created these themes, though we must at the same time not forget, of course, the change in meaning by which this material has been affected in the course of time. Our work of interpretation uncovers, so to say, the raw material, which must often enough be described as sexual in the widest sense, but has found the most varied application in later adaptations. Derivations of this kind are apt to bring down on us the wrath of all non-analytically schooled workers, as though we were seeking to deny or undervalue everything that was later erected on the original basis. Nevertheless, such discoveries are instructive and interesting. The same is true of tracing back the origin of particular themes in plastic art, as, for instance, when M. J. Eisler (1919), following indications in his patients' dreams, gave an analytic interpretation of the youth playing with a little boy represented in the Hermes of Praxiteles. And lastly I cannot resist pointing out how often light is thrown by the interpretation of dreams on mythological themes in particular. Thus, for instance, the legend of the Labyrinth can be recognized as a representation of anal birth: the twisting paths are the bowels and Ariadne's thread is the umbilical cord.

The methods of representation employed by the dream-work – fascinating material, scarcely capable of exhaustion – have been made more and more familiar to us by closer study. I will give you a few examples of them. Thus, for instance, dreams represent the relation of frequency by a multiplication of similar things. Here is a young girl's remarkable dream. She dreamt she came into a great hall and found someone in it sitting on a chair; this was repeated six or eight times or more, but each time it was her father. This is easy to understand when we discover, from accessory details in the interpretation, that this room stood for the womb. The dream then becomes equivalent to the phantasy, familiarly found in girls, of having met their father already during their intrauterine life when he visited the womb while their mother was pregnant. You should not be confused by the fact that something is reversed in the dream – that her father's 'coming in' is displaced on to herself; incidentally, this has a special meaning of its own as well. The [26]

multiplication of the figure of the father can only express the fact that the event in question occurred repeatedly. After all, it must be allowed that the dream is not taking very much on itself in expressing frequency by multiplicity.[1] It has only needed to go back to the original significance of the former word; today it means to us a repetition in time, but it is derived from an accumulation in space. In general, indeed, where it is possible, the dream-work changes temporal relations into spatial ones and represents them as such. In a dream, for instance, one may see a scene between two people who look very small and a long way off, as though one were seeing them through the wrong end of a pair of opera glasses. Here, both the smallness and the remoteness in space have the same significance: what is meant is remoteness in *time* and we are to understand that the scene is from the remote past.

Again, you may remember that in my earlier lectures I already told you (and illustrated the fact by examples) that we had learnt to make use for our interpretations even of the purely *formal* features of the manifest dream – that is, to transform them into material coming from the latent dream thoughts.[2] As you already know, all dreams that are dreamt in a single night belong in a single context. But it is not a matter of indifference whether these dreams appear to the dreamer as a continuum or whether he divides them into several parts and into how many. The number of such parts often corresponds to an equal number of separate focal points in the structural formation of the latent dream thoughts or to contending trends in the dreamer's mental life, each of which finds a dominant, even though never an exclusive, expression in one particular part of the dream. A short introductory dream and a longer main dream following it often stand in the relation of protasis and apodosis [conditional and consequential clauses], of which a very
[27] clear instance will be found in the old lectures.[3] A dream which is described by the dreamer as 'somehow interpolated' will actually correspond to a dependent clause in the dream thoughts. Franz Alexander (1925) has shown in a study on pairs of dreams that it not infrequently happens that two dreams in one night share the carrying out of the dream's task by producing a wish fulfilment in two stages if they are taken together, though each dream separately would not effect that result. Suppose, for instance, that the dream wish had as its content

1 ['*Häufigkeit*' and '*Häufung*' in German. Both words are derived from '*Haufen*' – a 'heap'.]

2 [Cf. *Introductory Lectures*, XI; *RSE*, **15**, 154. See also *The Interpretation of Dreams*, ibid., **4**, 293 ff.]

3 [*Introductory Lectures*, XII; ibid., **15**, 161 f. For all of this see also *The Interpretation of Dreams*, ibid., **4**, 280 ff. and 295 ff.]

some illicit action in regard to a particular person. Then in the first dream the person will appear undisguised, but the action will be only timidly hinted at. The second dream will behave differently. The action will be named without disguise, but the person will be either made unrecognizable or replaced by someone indifferent. This, you will admit, gives one an impression of actual cunning. Another and similar relation between the two members of a pair of dreams is found where one represents a punishment and the other the sinful wish fulfilment. It amounts to this: 'if one accepts the punishment for it, one can go on to allow oneself the forbidden thing.'

I cannot detain you any longer over such minor discoveries or over the discussions relating to the employment of dream interpretation in the work of analysis. I feel sure you are impatient to hear what changes have been made in our fundamental views on the nature and significance of dreams. I have already warned you that precisely on this there is little to report to you. The most disputed point in the whole theory was no doubt the assertion that all dreams are the fulfilments of wishes. The inevitable and ever-recurring objection raised by the layman that there are nevertheless so many anxiety dreams was, I think I may say, completely disposed of in my earlier lectures.[1] With the division into wishful dreams, anxiety dreams and punishment dreams, we have kept our theory intact.

Punishment dreams, too, are fulfilments of wishes, though not of wishes of the drive impulses but of those of the critical, censoring and punishing agency in the mind. If we have a pure punishment dream before us, an easy mental operation will enable us to restore the wishful dream to which the punishment dream was the correct rejoinder and which, owing to this repudiation, was replaced as the manifest dream. [28]
As you know, ladies and gentlemen, the study of dreams was what first helped us to understand the neuroses, and you will find it natural that our knowledge of the neuroses was later able to influence our view [*Auffassung*][T] of dreams. As you will hear,[2] we have been obliged to postulate the existence in the mind of a special critical and prohibiting agency which we have named the 'superego' [*Über-Ich*][T]. Since recognizing that the censorship of dreams is also a function of this agency, we have been led to examine the part played by the superego in the construction of dreams more carefully.

1 [See *Introductory Lectures*, XIV; *RSE*, **15**, 186 ff.]

2 [In Lecture XXXI below.]

Only two serious difficulties have arisen against the wish-fulfilment theory of dreams. A discussion of them leads far afield and has not yet, indeed, brought us to any wholly satisfying conclusion.

The first of these difficulties is presented in the fact that people who have experienced a shock, a severe psychical trauma – such as happened so often during the war and such as affords the basis for traumatic hysteria – are regularly taken back in their dreams into the traumatic situation. According to our hypotheses about the function of dreams this should not occur. What wishful impulse could be satisfied by harking back in this way to this exceedingly distressing traumatic experience? It is hard to guess.

We meet with the second of these facts almost every day in the course of our analytic work; and it does not imply such an important objection as the other does. One of the tasks of psychoanalysis, as you know, is to lift the veil of amnesia which hides the earliest years of childhood and to bring to conscious memory the manifestations of early infantile sexual life which are contained in them. Now these first sexual experiences of a child are linked to painful impressions of anxiety, prohibition, disappointment and punishment. We can understand their having been repressed; but, that being so, we cannot understand how it is that they have such free access to dream life, that they provide the pattern for so many dream phantasies [*Traumphantasien*] and that dreams are filled with reproductions of these scenes from childhood and with allusions to them. It must be admitted that their unpleasurable character [*Unlustcharakter*][T] and the dream-work's wish-fulfilling purpose seem far from mutually compatible. But it may be that in this case we are magnifying the difficulty. After all, these same infantile experiences have attached to them all the imperishable, unfulfilled drive wishes which throughout life provide the energy for the construction of dreams, and to which we may no doubt credit the possibility, in their mighty uprush, of forcing to the surface, along with the rest, the material of distressing events. And on the other hand the manner and form in which this material is reproduced shows unmistakably the efforts of the dream-work directed to denying the unpleasure by means of distortion and to transforming disappointment into attainment.

Unlust [29]

With the traumatic neuroses things are different. In their case the dreams regularly end in the generation of anxiety. We should not, I think, be afraid to admit that here the function of the dream has failed. I will not invoke the saying that the exception proves the rule: its wisdom seems to me most questionable. But no doubt the exception does

not overturn the rule. If, for the sake of studying it, we isolate one particular psychical function, such as dreaming, from the psychical machinery as a whole, we make it possible to discover the laws that are peculiar to it; but when we insert it once more into the general context we must be prepared to discover that these findings are obscured or impaired by collision with other forces. We say that a dream is the fulfilment of a wish; but if you want to take these latter objections into account, you can say nevertheless that a dream is an *attempt* at the fulfilment of a wish. No-one who can properly appreciate the dynamics of the mind will suppose that you have said anything different by this. In certain circumstances a dream is able to put its intention into effect only very incompletely, or must abandon it entirely. Unconscious fixation to a trauma seems to be foremost among these obstacles to the function of dreaming. While the sleeper is obliged to dream, because the relaxation of repression at night allows the upward pressure of the traumatic fixation to become active, there is a failure in the functioning of his dream-work, which would like to transform the memory traces of the traumatic event into the fulfilment of a wish. In these circumstances it will happen that one cannot sleep, that one gives up sleep from dread of the failure of the function of dreaming. Traumatic neuroses are here [30]
offering us an extreme case; but we must admit that childhood experiences, too, are of a traumatic nature, and we need not be surprised if comparatively trivial interferences with the function of dreams may arise under other conditions as well.[1]

1 [The topic of the last three paragraphs was first raised by Freud in Chapters II and III of *Beyond the Pleasure Principle* (1920*g*), *RSE*, **18**, 12 ff. and 18 ff. Further allusions to it can be found in Lecture XXXII, p. 93 f. below.]

LECTURE XXX

DREAMS AND OCCULTISM[1]

[31] Ladies and Gentlemen, today we will proceed along a narrow path, but one which may lead us to a wide prospect.

You will scarcely be surprised by the news that I am going to speak to you on the relation of dreams to occultism. Dreams have, indeed, often been regarded as the gateway into the world of mysticism, and even today are themselves looked on by many people as an occult phenomenon. Even we, who have made them into a subject for scientific study, do not dispute that one or more threads link them to those obscure matters. Mysticism, occultism – what is meant by these words? You must not expect me to make any attempt at embracing this ill-circumscribed region with definitions. We all know in a general and indefinite manner what the words imply to us. They refer to some sort of 'other world', lying beyond the bright world governed by relentless laws which has been constructed for us by science.

Occultism asserts that there are in fact 'more things in heaven and earth than are dreamt of in our philosophy'. Well, we need not feel bound by the narrow-mindedness of academic philosophy; we are ready to believe what is shown to us to deserve belief.

We propose to proceed with these things as we do with any other scientific material: first of all to establish whether such events can really be shown to occur, and then and only then, when their factual nature cannot be doubted, to concern ourselves with their explanation. It cannot be denied, however, that even the putting of this decision into action is made hard for us by intellectual, psychological and historical factors. The case is not the same as when we approach other investigations.

[32] First, the intellectual difficulty. Let me give you a crude and obvious explanation of what I have in mind. Let us suppose that the question at issue is the constitution of the interior of the earth. We have, as you are

1 [A list of Freud's writings touching on this subject can be found in the Editors' Note to the paper on 'Psychoanalysis and Telepathy' (1941*d* [1921]), *RSE*, **18**, 166. Ernest Jones has given a comprehensive survey of Freud's attitude to occultism in Chapter XIV of the third volume of his biography (1957).]

aware, no certain knowledge about it. We suspect that it consists of heavy metals in an incandescent state. Then let us imagine that someone puts forward an assertion that the interior of the earth consists of water saturated with carbonic acid – that is to say, with a kind of soda-water. We shall no doubt say that this is most improbable, that it contradicts all our expectations and pays no attention to the known facts which have led us to adopt the metal hypothesis. Nevertheless, it is not inconceivable; if someone were to show us a way of testing the soda-water hypothesis we should follow it without objecting. But suppose now that someone else comes along and seriously asserts that the core of the earth consists of jam. Our reaction to this will be quite different. We shall tell ourselves that jam does not occur in nature, that it is a product of human cooking, that, moreover, the existence of this material presupposes the presence of fruit trees and their fruit, and that we cannot see how we can locate vegetation and human cookery in the interior of the earth. The result of these intellectual objections will be a switching of our interest: instead of starting upon an investigation of whether the core of the earth really consists of jam, we shall ask ourselves what sort of person this must be who can arrive at such a notion, or at most we shall ask him where he got it from. The unlucky inventor of the jam theory will be very much insulted and will complain that we are refusing [*versagen*][T] to make an objective investigation of his assertion on the ground of a pretendedly scientific prejudice. But this will be of no help to him. We perceive that prejudices are not always to be reprobated, but that they are sometimes justified and expedient because they save us useless labour. In fact, they are only conclusions based on an analogy with other well-founded judgements. *Versagung*

A whole number of occultist assertions have the same sort of effect on us as the jam hypothesis; so that we consider ourselves justified in rejecting them at sight, without further investigation. But all the same, the position is not so simple. A comparison like the one I have chosen proves nothing, or proves as little as comparisons in general. It remains doubtful whether it fits the case, and it is clear that its choice was already determined by our attitude of contemptuous rejection. Prejudices are sometimes expedient and justified; but sometimes they are erroneous and detrimental, and one can never tell when they are the one and when the other. The history of science itself abounds in instances which are a warning against premature condemnation. For a long time it was regarded as a senseless hypothesis to suppose that the stones, which we now call meteorites, could have reached the earth from outer space or [33]

that the rocks forming mountains, in which the remains of shells are imbedded, could have once formed the bed of the sea. Incidentally, much the same thing happened to our psychoanalysis when it brought forward its inference of there being an unconscious. Thus we analysts have special reason to be careful in using intellectual considerations for rejecting new hypotheses and must admit that they do not relieve us of feelings of antipathy, doubt and uncertainty.

I have spoken of the second factor [that complicates our approach to the subject] as the psychological one. By that I mean the general tendency of mankind to credulity and a belief in the miraculous. From the very beginning, when life takes us under its strict discipline, a resistance stirs within us against the relentlessness and monotony of the laws of thought and against the demands of reality-testing.[1] Reason becomes the enemy which withholds from us so many possibilities of pleasure [*Lustmöglichkeit*]. We discover how much pleasure it gives us to withdraw from it, temporarily at least, and to surrender to the allurements of nonsense. Schoolboys delight in the twisting of words; when a scientific congress is over, the specialists make fun of their own activities; even earnest-minded men enjoy a joke.[2] More serious hostility to 'Reason and Science, the highest strength possessed by man',[3] awaits its opportunity; it hastens to prefer the miracle doctor or the practitioner of nature cures to the 'qualified' physician; it is favourable to the assertions of occultism so long as those alleged facts can be taken as breaches [34] of laws and rules; it lulls criticism to sleep, falsifies perceptions and enforces confirmations and agreements which cannot be justified. If this human tendency is taken into account, there is every reason to discount much of the information put forward in occultist literature.

I have called the third doubt the historical one; and by it I mean to point out that there is in fact nothing new in the world of occultism. There emerge in it once more all the signs, miracles, prophecies and apparitions which have been reported to us from ancient times and in ancient books and which we thought had long since been disposed of as the offspring of unbridled imagination or of tendentious fraud, as the product of an age in which man's ignorance was very great and the scientific spirit was still in its cradle. If we accept the truth of what,

1 [I.e. the process of testing things to see if they are real. This is discussed in 'A Metapsychological Supplement to the Theory of Dreams' (1916–17*f* [1915]), *RSE*, **14**, 204–8. See also *Introductory Lectures*, XXIII; ibid., **16**, 328.]

2 [This 'pleasure in nonsense' had been fully discussed by Freud in Chapter IV of his book on *Jokes* (1905*c*), ibid., **8**, 110–12.]

3 [Goethe, *Faust*, Part I, Scene 4.]

according to the occultists' information, still occurs today, we must also believe in the authenticity of the reports which have come down to us from ancient times. And we must then reflect that the tradition and sacred books of all peoples are brimful of similar marvellous tales and that the religions base their claim to credibility on precisely such miraculous events and find proof in them of the operation of superhuman powers. That being so, it will be hard for us to avoid a suspicion that the interest in occultism is in fact a religious one and that one of the secret motives [*Motiven*][T] of the occultist movement is to come to the help of religion, threatened as it is by the advance of scientific thought. And with the discovery of this motive our distrust must increase and our disinclination to embark on the examination of these supposedly occult phenomena.

Sooner or later, however, this disinclination must be overcome. We are faced with a question of fact: is what the occultists tell us true or not? It must, after all, be possible to decide this by observation. At bottom we have cause for gratitude to the occultists. The miraculous stories from ancient times are beyond the reach of our testing. If in our opinion they cannot be substantiated, we must admit that they cannot, strictly speaking, be disproved. But about contemporary happenings, at which we are able to be present, it must be possible for us to reach a definite judgement. If we arrive at a conviction that such miracles do not occur today, we need not fear the counterargument that they may nevertheless [35] have taken place in ancient times: in that case other explanations will be much more plausible. Thus we have settled our doubts and are ready to take part in an investigation of occult phenomena.

But here unluckily we are met with circumstances which are exceedingly unfavourable to our honest intentions. The observations on which our judgement is supposed to depend take place under conditions which make our sensory perceptions uncertain and which blunt our power of attention; they occur in darkness or in dim red light after long periods of blank expectation. We are told that in fact our unbelieving – that is to say, critical – attitude may prevent the expected phenomena from happening. The situation thus brought about is nothing less than a caricature of the circumstances in which we are usually accustomed to carry out scientific enquiries. The observations are made upon what are called 'mediums' – individuals to whom peculiarly 'sensitive' faculties are ascribed, but who are by no means distinguished by outstanding qualities of intellect or character, and who are not, like the miracle-workers of the past, inspired by any great idea or serious purpose. On the

contrary, they are looked upon, even by those who believe in their secret powers, as particularly untrustworthy; most of them have already been detected as cheats and we may reasonably expect that the same fate awaits the remainder. Their performances give one the impression of children's mischievous pranks or of conjuring tricks.[1] Never has anything of importance yet emerged from séances with these mediums – the revelation of a new source of power, for instance. We do not, it is true, expect to receive hints on pigeon-breeding from the conjurer who produces pigeons by magic from his empty top-hat. I can easily put myself in the place of a person who tries to fulfil the demands of an objective attitude and so takes part in occult séances, but who grows tired after a while and turns away in disgust from what is expected of him and goes back unenlightened to his former prejudices. The reproach may be made against such a person that this is not the right way of behaving: that one ought not to lay down in advance what the phenomena one is
[36] seeking to study shall be like and in what circumstances they shall appear. One should, on the contrary, persevere, and give weight to the precautionary and supervisory measures by which efforts have recently been made to provide against the untrustworthiness of mediums. Unfortunately this modern protective technique makes an end of the easy accessibility of occult observations. The study of occultism becomes a specialized and difficult occupation – an activity one cannot pursue alongside of one's other interests. And until those concerned in these investigations have reached their conclusions, we are left to our doubts and our own conjectures.

Of these conjectures no doubt the most probable is that there is a real core of yet unrecognized facts in occultism round which cheating and phantasy have spun a veil which it is hard to pierce. But how can we even approach this core? At what point can we attack the problem? It is here, I think, that dreams come to our help, by giving us a hint that from out of this chaos we should pick the subject of *telepathy*.

What we call 'telepathy' is, as you know, the alleged fact that an event which occurs at a particular time comes at about the same moment to the consciousness of someone distant in space, without the paths of communication that are familiar to us coming into question. It is implicitly presupposed that this event concerns a person in whom the other one (the receiver of the intelligence) has a strong emotional interest. For instance, Person A may be the victim of an accident or may die,

1 [Cf. the similar remarks in *The Future of an Illusion* (1927*c*), *RSE*, **21**, 25.]

and Person B, someone nearly attached to him – his mother or daughter or fiancée – learns the fact at about the same time through a visual or auditory perception. In this latter case, then, it is as if she had been informed by telephone, though such was not the case; it is a kind of psychical counterpart to wireless telegraphy. I need not insist to you on the improbability of such events, and there is good reason for dismissing the majority of such reports. A few are left over which cannot be so easily disposed of in this way. Permit me now, for the purpose of what I have to tell you, to omit the cautious little word 'alleged' and to proceed as though I believed in the objective reality of the phenomenon of telepathy. But bear firmly in mind that that is not the case and that I have committed myself to no conviction.

Actually I have little to tell you – only a modest fact. I will also at once [37]
reduce your expectations still further by saying that at bottom dreams have little to do with telepathy. Telepathy does not throw any fresh light on the nature of dreams nor do dreams give any direct evidence of the reality of telepathy. Moreover, the phenomenon of telepathy is by no means bound up with dreams; it can occur as well during the waking state. The only reason for discussing the relation between dreams and telepathy is that the state of sleep seems particularly suited for receiving telepathic messages. In such cases one has what is called a telepathic dream and, when it is analysed, one forms a conviction that the telepathic news has played the same part as any other portion of the day's residues and that it has been changed in the same way by the dream-work and made to serve its purpose.

During the analysis of one such telepathic dream, something occurred which seems to me of sufficient interest in spite of its triviality to serve as the starting point of this lecture. When in 1922 I gave my first account of this matter I had only a single observation at my disposal. Since then I have made a number of similar ones, but I will keep to the first example, because it is easiest to describe, and I will take you straight away *in medias res*.[1]

An obviously intelligent man, who from his own account was not in the least 'inclined towards occultism', wrote to me about a dream he had had which seemed to him remarkable. He began by informing me that his married daughter, who lived at a distance from him, was expecting her first confinement in the middle of December. This

1 [This was first published in very much greater detail in 'Dreams and Telepathy' (1922*a*), *RSE*, **18**, 191 ff.]

daughter meant a great deal to him and he knew too that she was very much attached to him. During the night of November 16–17, then, he dreamt that his wife had given birth to twins. A number of details followed, which I may here pass over, and all of which were never in fact explained. The wife who in the dream had become the mother of twins was his *second* wife, his daughter's stepmother. He did not wish to have a child by his present wife who, he said, had no aptitude for
[38] bringing up children sensibly; moreover, at the time of the dream he had long ceased to have sexual relations with her. What led him to write to me was not doubt about the theory of dreams, though the manifest content of his dream would have justified it, for why did the dream, in complete contradiction to his wishes, make his wife give birth to children? Nor, according to him, was there any reason to fear that this unwished-for event might occur. What induced him to report this dream to me was the circumstance that on the morning of November 18 he received a telegram announcing that his daughter had given birth to twins. The telegram had been handed in the day before and the birth had taken place during the night of November 16–17, at about the same time at which he had had the dream of his wife's twin birth. The dreamer asked me whether I thought the coincidence between dream and event was accidental. He did not venture to call the dream a telepathic one, since the difference between its content and the event affected precisely what seemed to him essential in it – the identity of the person who gave birth to the children. But one of his comments shows that he would not have been astonished at an actual telepathic dream: he believed his daughter would certainly have 'thought particularly of him' during her labour.

I feel sure, ladies and gentlemen, that you have been able to explain this dream already and understand too why I have told it you. Here was a man who was dissatisfied with his second wife and who would prefer his wife to be like the daughter of his first marriage. This 'like' dropped out, of course, so far as the unconscious was concerned. And now the telepathic message arrived during the night to say that his daughter had given birth to twins. The dream-work took control of the news, allowed the unconscious wish to operate on it – the wish that he could put his daughter in the place of his second wife – and thus arose the puzzling manifest dream, which disguised the wish and distorted the message. We must admit that it is only the *interpretation* of the dream that has shown us that it was a telepathic one: psychoanalysis has revealed a telepathic event which we should not otherwise have discovered.

But pray do not let yourselves be misled! In spite of all this, dream interpretation has told us nothing about the objective reality of the telepathic event. It may equally be an illusion which can be explained in [39]
another way. The man's latent dream thoughts may have run: 'Today is the day the confinement should take place if my daughter is really out in her reckoning by a month, as I suspect. And when I saw her last she looked just as though she was going to have twins. How my dead wife who was so fond of children would have rejoiced over twins!' (I base this last factor on some associations of the dreamer's which I have not mentioned.) In that case the instigation to the dream would have been well-grounded suspicions on the dreamer's part and not a telepathic message; but the outcome would remain the same. You see then that even the interpretation of this dream has told us nothing on the question of whether we are to allow objective reality to telepathy. That could only be decided by a thoroughgoing investigation of all the circumstances of the case – which was unfortunately no more possible in this instance than in any of the others in my experience. Granted that the telepathy hypothesis offers by far the simplest explanation, yet that does not help us much. The simplest explanation is not always the correct one; the truth is often no simple matter, and before deciding in favour of such a far-reaching hypothesis we should like to have taken every precaution.

We may now leave the subject of dreams and telepathy: I have nothing more to say to you on it. But kindly observe that what seemed to us to teach us something about telepathy was not the dream but the interpretation of the dream, its psychoanalytic working over. Accordingly, in what follows we may leave dreams entirely on one side and may follow an expectation that the employment of psychoanalysis may throw a little light on other events described as occult. There is, for instance, the phenomenon of thought transference [*Gedankenübertragung*], which is so close to telepathy and can indeed without much violence be regarded as the same thing. It claims that mental processes in one person – ideas, emotional states, conative impulses [*Willensimpulse*] – can be transferred to another person through empty space without employing the familiar methods of communication by means of words and signs. You will realize how remarkable, and perhaps even of what great practical importance, it would be if something of the kind really happened. It may be noted, incidentally, that strangely enough precisely this [40]
phenomenon is referred to least frequently in the miraculous stories of the past.

I have formed an impression in the course of the psychoanalytic treatment of patients that the activities of professional fortune-tellers conceal an opportunity for making particularly unobjectionable observations on thought transference. These are insignificant and even inferior people, who immerse themselves in some sort of performance[1] – lay out cards, study writing or lines upon the palm of the hand, or make astrological calculations – and at the same time, after having shown themselves familiar with portions of their visitor's past or present circumstances, go on to prophesy their future. As a rule their clients exhibit great satisfaction over these achievements and feel no resentment if later on these prophecies are not fulfilled. I have come across several such cases and have been able to study them analytically, and in a moment I will tell you the most remarkable of these instances. Their convincingness is unfortunately impaired by the numerous reticences to which I am compelled by the obligation of medical discretion. I have, however, of set purpose avoided distortions. So listen now to the story of one of my women patients, who had an experience of this kind with a fortune-teller.[2]

[41] She had been the eldest of a numerous family and had grown up with an extremely strong attachment to her father. She had married young and had found entire satisfaction in her marriage. Only one thing was wanting to her happiness: she had remained childless, so she could not bring her beloved husband completely into the place of her father. When, after long years of disappointment, she decided to undergo a gynaecological operation, her husband revealed to her that the blame was his: an illness before their marriage had made him incapable of procreating children. She took the disappointment badly, became neurotic and clearly suffered from fears of being tempted [into

1 [In his earlier, posthumously published, paper 'Psychoanalysis and Telepathy' (1941*d* [1921]), Freud had elaborated on the significance of the fortune-teller's distracting his attention by some meaningless activity as a means of releasing an unconscious mental process (*RSE*, **18**, 174). He there compared the use of a similar 'distracting contrivance' in the making of some kinds of jokes; see for this his book on *Jokes* (1905*c*), ibid., **8**, 131–3. Much earlier, in his technical contribution to *Studies on Hysteria* (1895*d*), he had brought forward the same explanation for certain techniques for producing hypnosis, and in particular for his own early method of eliciting forgotten facts by pressure on the patient's forehead, ibid., **2**, 241 f.; and this he afterwards developed in a discussion of hypnotism in his *Group Psychology* (1921*c*), ibid., **18**, 116–18. Compare also some remarks in *The Psychopathology of Everyday Life* (1901*b*) on the fact that attention directed to an automatic action *interferes* with its performance, ibid., **6**, 114 f.]

2 [This case is reported at greater length, with some slight variations, in 'Psychoanalysis and Telepathy', ibid., **18**, 175–9, and much more briefly in Section C of 1925*i*; ibid., **19**, 125. The variations are recorded in the editorial notes to 'Psychoanalysis and Telepathy'. Material from this case is also reported in 1913*a*, ibid., **12**, 267 ff.; 1913*g*, ibid., **12**, 303 ff.; and 1913*j*, ibid., **12**, 313 ff.]

unfaithfulness to her husband]. To cheer her up, he took her with him on a business trip to Paris. They were sitting there one day in the hall of their hotel when she noticed a stir among the hotel servants. She asked what was going on and was told that Monsieur le Professeur had arrived and was giving consultations in a little room over there. She expressed a wish to have a try. Her husband rejected the idea, but while he was not watching she slipped into the consulting room and faced the fortune-teller. She was 27 years old, but looked much younger and had taken off her wedding ring. Monsieur le Professeur made her lay her hand on a tray filled with ashes and carefully studied the imprint; he then told her all kinds of things about hard struggles that lay before her, and ended with the comforting assurance that all the same she would still get married and would have two children by the time she was 32. When she told me this story she was 43 years old, seriously ill and without any prospect of ever having a child. Thus the prophecy had not come true; yet she spoke of it without any sort of bitterness but with an unmistakable expression of satisfaction, as though she were recalling a cheerful event. It was easy to establish that she had not the slightest notion of what the two numbers in the prophecy [2 and 32] might mean or whether they meant anything at all.

You will say that this is a stupid and incomprehensible story and ask why I have told it you. I should be entirely of your opinion if – and this is the salient point – analysis had not made it possible to arrive at an interpretation of the prophecy which is convincing precisely from the explanation it affords of the details. For the two numbers find their place in the life of my patient's *mother.* She had married late – not till she was over thirty, and in the family they had often dwelt on the fact [42] of the success with which she had hastened to make up for lost time. Her two first children (with our patient the elder) had been born with the shortest possible interval between them, in a single calendar year; and she had in fact two children by the time she was 32. What Monsieur le Professeur had said to my patient meant therefore: 'Take comfort from the fact of being so young. You'll have the same destiny as your mother, who also had to wait a long time for children, and you'll have two children by the time you're 32.' But to have the same destiny as her mother, to put herself in her mother's place, to take her place with her father – that had been the strongest wish of her youth, the wish on account of whose non-fulfilment she was just beginning to fall ill. The prophecy promised her that the wish would still be fulfilled in spite of everything; how could she fail to feel friendly to the prophet? Do you

regard it as possible, however, that Monsieur le Professeur was familiar with the facts of the intimate family history of his chance client? Out of the question! How, then, did he arrive at the knowledge which enabled him to give expression to my patient's strongest and most secret wish by including the two numbers in his prophecy? I can see only two possible explanations. Either the story as it was told me is untrue and the events occurred otherwise, or thought transference exists as a real phenomenon. One can suppose, no doubt, that after an interval of sixteen years the patient had introduced the two numbers concerned into her recollection from her unconscious. I have no basis for this suspicion, but I cannot exclude it, and I imagine that you will be readier to believe in a way out of that kind than in the reality of thought transference. If you do decide on the latter course, do not forget that it was only analysis that created the occult fact – uncovered it when it lay distorted to the point of being unrecognizable.

If it were a question of *one* case only like that of my patient, one would shrug it aside. No-one would dream of erecting upon a single observation a belief which implies taking such a decisive line. But you must believe me when I assure you that this is not the only case in my experience. I have collected a whole number of such prophecies and
[43] from all of them I gained the impression that the fortune-teller had merely brought to expression the thoughts, and more especially the secret wishes, of those who were questioning him, and that we were therefore justified in analysing these prophecies as though they were subjective products, phantasies or dreams of the people concerned. Not every case, of course, is equally convincing and in not every case is it equally possible to exclude more rational explanations; but, taking them as a whole, there remains a strong balance of probability in favour of thought transference as a fact. The importance of the subject would justify me in producing all my cases to you; but that I cannot do, owing to the prolixity of description that would be involved and to the inevitable breach of the obligations of discretion. I will try so far as possible to appease my conscience in giving you a few more examples.

One day I was visited by a highly intelligent young man, a student preparing for his final examinations for a doctorate, but unable to take them since, as he complained, he had lost all interest and power of concentration and even any faculty for orderly memory.[1] The previous

1 [This case too appears in rather greater detail in 'Psychoanalysis and Telepathy' (1941*d*), *RSE*, **18**, 171–5.]

history of this condition of quasi-paralysis was soon revealed: he had fallen ill after carrying out a great act of self-discipline. He had a sister, to whom he was attached by an intense but always restrained devotion, just as she was to him. 'What a pity we can't get married!' they would often say to each other. A respectable man fell in love with the sister; she responded to his affection, but her parents did not assent to the union. In their difficulty the young couple turned to her brother, nor did he refuse his help. He made it possible for them to correspond with each other, and his influence eventually persuaded the parents to consent. In the course of the engagement, however, an occurrence took place whose meaning it was easy to guess. He went with his future brother-in-law on a difficult mountain climb without a guide; they lost their way and were in danger of not returning safe and sound. Shortly after his sister's marriage he fell into this condition of mental exhaustion.

The influence of psychoanalysis restored his ability to work and he [44]
left me in order to go in for his examinations; but after he had passed them successfully he came back to me for a short time in the autumn of the same year. It was then that he related a remarkable experience to me which he had had before the summer. In his university town there lived a fortune-teller who enjoyed great popularity. Even the princes of the royal house used to consult her before important undertakings. Her mode of operation was very simple. She asked to be given the date of the relevant person's birth; she needed to know nothing else about him, not even his name. She then proceeded to consult her astrological books, made long calculations and finally uttered a prophecy relating to the person in question. My patient decided to call upon her mystical arts in connection with his brother-in-law. He visited her and told her the relevant date. After carrying out her calculations she made her prophecy: 'The person in question will die in July or August of this year of crayfish or oyster poisoning.' My patient finished his story with the words: 'It was quite marvellous!'

From the first I had listened with irritation. After this exclamation of his I went so far as to ask: 'What do you see that's so marvellous in this prophecy? Here we are in late autumn and your brother-in-law isn't dead or you'd have told me long ago. So the prophecy hasn't come true.' 'No doubt that's so,' he replied, 'but here is what's marvellous. My brother-in-law is passionately devoted to crayfish and oysters and in the previous summer – that's to say, *before* my visit to the fortune-teller – he had an attack of oyster poisoning[1] of which he nearly died.' What

1 ['Crayfish poisoning' in the 'Psychoanalysis and Telepathy' version (1941*d*), *RSE*, **18**, 173.]

was I to say to this? I could only feel annoyed that this highly educated man (who had moreover been through a successful analysis) should not have a clearer view of the position. I for my part, rather than believe that it is possible to calculate the onset of an attack of crayfish or oyster poisoning from astrological tables, prefer to suppose that my patient had not yet overcome his hatred for his rival, the repression of which had earlier led to his falling ill, and that the fortune-teller was simply giving expression to his own expectation: 'a taste of that kind isn't to be given up, and one day, all the same, it will be the end of him.' I must
[45] admit that I cannot think of any other explanation for this case, unless, perhaps, that my patient was having a joke with me. But neither then nor at a later time did he give me grounds for such a suspicion, and he seemed to be meaning what he said seriously.

Here is another case.[1] A young man in a position of consequence was involved in a liaison with a *demi-mondaine* which was characterized by a curious compulsion. He was obliged from time to time to provoke her with derisive and insulting remarks till she was driven to complete desperation. When he had brought her to that point, he was relieved, became reconciled with her and made her a present. But now he wanted to be free of her: the compulsion seemed to him uncanny. He noticed that this liaison was damaging his reputation; he wanted to have a wife of his own and to raise a family. But since he could not get free from this *demi-mondaine* by his own strength, he called analysis to his help. After one of these abusive scenes, when the analysis had already started, he got her to write something on a piece of paper, so as to show it to a graphologist. The report that he received from him was that the writing was that of someone in extreme despair, who would certainly commit suicide in the next few days. This did not, it is true, occur and the lady remained alive; but the analysis succeeded in loosening his bonds. He left the lady and turned to a young girl whom he expected would be able to make him a good wife. Soon afterwards a dream appeared which could only hint at a dawning doubt as to the girl's worthiness. He obtained a specimen of her writing too, took it to the same authority, and was given a verdict on her writing which confirmed his apprehensions. He therefore abandoned the idea of making her his wife.

1 [Also reported with some further details in 'Psychoanalysis and Telepathy', *RSE*, **18**, 180–2, though the present account is in some respects fuller. Some of the 'obligations of discretion' mentioned above are there retroactively breached in the editorial notes.]

In order to form an opinion of the graphologist's reports, especially the first one, we must know something of our subject's secret history. In his early youth he had (in accordance with his passionate nature) fallen in love to the pitch of frenzy with a married woman who was still young but nevertheless older than he was. When she rejected him, he made an attempt at suicide which, there can be no doubt, was seriously intended. It was only by a hair's breadth that he escaped death and he was restored only after a long period of nursing. But this wild action made a deep impression on the woman he loved; she granted him her favours, he became her lover and thenceforward remained secretly attached to her and served her with a truly chivalrous devotion. More than twenty years later, when they had both grown older – but the woman, naturally, more than he – the need was awakened in him to detach himself from her, to make himself free, to lead a life of his own, to set up a house and raise a family. And along with this feeling of satiety there arose in him his long-suppressed craving for vengeance on his mistress. As he had once tried to kill himself because she had spurned him, so he wished now to have the satisfaction of her seeking death because he left her. But his love was still too strong for it to be possible for this wish to become conscious in him; nor was he in a position to do her enough harm to drive her into death. In this frame of mind he took on the *demi-mondaine* as a sort of whipping-boy, to satisfy his thirst for revenge *in corpore vili*; and he allowed himself to practise upon her all the torments which he might expect would bring about with her the result he wished to produce on his mistress. The fact that the vengeance applied to the latter was betrayed by his making her into a confidante and adviser in his liaison instead of concealing his defection from her. The wretched woman, who had long fallen from giving to receiving favours, probably suffered more from his confidences than the *demi-mondaine* did from his brutalities. The compulsion of which he complained in regard to this substitutive figure, and which drove him to analysis, had of course been transferred on to her from his old mistress; it was from her that he wanted to free himself but could not. I am not an authority on handwriting and have no high opinion of the art of divining character from it; still less do I believe in the possibility of foretelling the writer's future in this way. You can see, however, whatever one may think of the value of graphology, that there is no mistaking the fact that the expert, when he promised that the writer of the specimen presented to him would commit suicide in the next few days, had once again only brought to light a powerful secret wish of the person [46]

who was questioning him. Something of the same kind happened afterwards in the case of the second report. What was there concerned, [47] however, was not an unconscious wish; it was the questioner's dawning doubt and apprehension that found a clear expression from the graphologist's mouth. Incidentally, my patient succeeded, with the help of analysis, in finding an object for his love outside the magic circle in which he had been spellbound.

Ladies and gentlemen, you have now heard how dream interpretation and psychoanalysis in general assist occultism. I have shown you from examples that by their application occult facts have been brought to light which would otherwise have remained unknown. Psychoanalysis cannot give a direct answer to the question that no doubt interests you the most – whether we are to believe in the objective reality of these findings. But the material revealed by its help makes an impression which is at all events favourable to an affirmative reply. Your interest will not come to a stop at this point, however. You will want to know what conclusions are justified by the incomparably richer material in which psychoanalysis has no part. But I cannot follow you there: it lies outside my province. The only further thing I could do would be to report observations to you which have at least so much relation to analysis that they were made during psychoanalytic treatment and were even perhaps made possible by its influence. I will tell you one such example – the one which has left the strongest impression behind on me. I shall tell it at great length and shall ask for your attention to a large number of details, though even so I shall have to suppress much that would have greatly increased the convincing force of the observation. It is an example in which the fact came clearly to light and did not need to be developed by analysis. In discussing it, however, we shall not be able to do without the help of analysis. But I will tell you in advance that this example too of apparent thought transference in the analytic situation is not exempt from all doubts and that it does not allow us to take up an unqualified position in support of the reality of occult phenomena.[1]

1 [This case is the one which should have been the 'third case' to be included in 'Psychoanalysis and Telepathy'. The circumstances of its omission were explained by Freud in the paper, *RSE*, **18**, 179 f., and commented on in the Editors' Note, ibid., 165 f. As was indicated there, the original draft survived. It resembled the version given here so closely that it was doubtful whether it was necessary to print it separately. The very few points of difference worth mentioning are noted here, in the editorial footnotes. For further details regarding the revision, see Grubrich-Simitis (1993, 274; trans., 216). For an English translation of the manuscript version, see Pierri (2011).]

Listen then: – One autumn day in the year 1919, at about 10.45 a.m., [48]
Dr David Forsyth,[1] who had just arrived from London, sent in his card to me while I was working with a patient. (My respected colleague from London University will not, I feel sure, regard it as an indiscretion if in this way I betray the fact that he spent some months being initiated by me into the arts of psychoanalytic technique.) I only had time to greet him and to make an appointment to see him later. Dr Forsyth had a claim to my particular interest; he was the first foreigner to come to me after I had been cut off by the war years and to bring a promise of better times. Soon afterwards, at eleven o'clock, Herr P., one of my patients, arrived – an intelligent and agreeable man, between forty and fifty years of age, who had originally come to me on account of difficulties with women.[2] His case did not promise any therapeutic success; I had long before proposed our stopping the treatment, but he had wished to continue it, evidently because he felt comfortable in a well-tempered father transference to me. At that period money played no part: there was too little of it about. The sessions which I spent with him were stimulating and refreshing for me as well, and consequently, in disregard of the strict rules of medical practice, analytic work was being carried on up to a foreseen time limit.

That day P. returned to his attempts at having erotic relations with women and once again mentioned a pretty, piquante, penniless girl, with whom he felt he might succeed, if the fact of her being a virgin did not scare him off any serious attempt. He had often talked of her before but that day he told me for the first time that, though of course she had no notion of the true grounds of his impediment, she used to call him 'Herr von Vorsicht' [Mr Foresight]. I was struck by this information; Dr Forsyth's visiting card lay beside me, and I showed it to him.

These are the facts of the case. I expect they will seem to you paltry; [49]
but listen a little longer, there is more behind them.

When he was young, P. had spent some years in England and since then had retained a permanent interest in English literature. He possessed a rich English library and used to bring me books from it. I owe to him an acquaintance with such authors as Bennett and Galsworthy, of whom till then I had read little. One day he lent me a novel of Galsworthy's with the title *The Man of Property*, whose scene is laid in

1 [Dr David Forsyth (1877–1941), consulting physician to Charing Cross Hospital, London, was an original member of the London Society for Psycho-Analysis, founded in 1913. – The autumn day in question was October 4, 1919.]

2 [The patient is identified as 'Herr B' in the original draft manuscript, where the nature of his 'difficulties with women' is described in more detail.]

the bosom of a family invented by the author, bearing the name of 'Forsyte'. Galsworthy himself was evidently captivated by this creation of his, for in later volumes he repeatedly came back to the members of this family and finally collected all the tales relating to them under the title of *The Forsyte Saga*. Only a few days before the occurrence I am speaking of, he had brought me a fresh volume from this series. The name 'Forsyte', and everything typical that the author had sought to embody in it, had played a part, too, in my conversations with P. and it had become part of the secret language which so easily grows up between two people who see a lot of each other. Now the name 'Forsyte' in these novels differs little from that of my visitor 'Forsyth' and, as pronounced by a German, the two can scarcely be distinguished; and there is an English word with a meaning – 'foresight' – which we should also pronounce in the same way and which would be translated '*Voraussicht*' or '*Vorsicht*'. Thus P. had in fact selected from his personal concerns the very name with which I was occupied at the same time as a result of an occurrence of which he was unaware.

That begins to look better, you will agree. But we shall, I think, receive a stronger impression of the striking phenomenon and even obtain an insight into its determinants if we throw some analytic light upon two other associations brought up by P. during the same session.

Firstly: One day of the previous week I had waited in vain for Herr P. at eleven o'clock, and had then gone out to visit Dr Anton von Freund[1] in his pension. I was surprised to find that Herr P. lived on another floor of the same building in which the pension was located. In connection with this I had later told P. that I had in a sense paid him a visit in his
[50] house; but I know definitely that I did not tell him the name of the person I visited in the pension. And now, shortly after mentioning 'Herr von Vorsicht' he asked me whether perhaps the Freud-Ottorego who was giving a course of lectures on English at the Volksuniversität[2] was my daughter. And for the first time during our long period of intercourse he gave my name the distorted form to which I have indeed become habituated by functionaries, officials and compositors: instead of 'Freud' he said 'Freund'.

Secondly: At the end of the same session he told me a dream, from which he had woken in a fright – a regular '*Alptraum*', he said. He added that not long ago he had forgotten the English word for that, and when someone had asked him said that the English for '*Alptraum*' was 'a

1 [A prominent Hungarian adherent and benefactor of psychoanalysis.]

2 ['People's University', providing what is known in England as 'Adult Education'.]

mare's nest'. This was nonsense, of course, he went on; 'a mare's nest' meant something incredible, a cock-and-bull story: the translation of '*Alptraum*' was 'nightmare'. The only element in common between this association and the previous one seemed to be the element 'English'. I was, however, reminded of a small incident which had occurred about a month earlier. P. was sitting with me in the room when another visitor, a dear friend from London, Dr Ernest Jones, unexpectedly came in after a long separation. I signed to him to go into the next room while I finished with P. The latter, however, had at once recognized him from his photograph hanging in the waiting room, and even expressed a wish to be introduced to him. Now Jones is the author of a monograph on the *Alptraum* – the nightmare. I did not know whether P. was acquainted with it; he avoided reading analytic literature. [Cf. Jones, 1912*c*.]

I should like to begin by putting before you an investigation of what analytic understanding can be arrived at of the background of P.'s associations and of the motives for them. P. was placed similarly to me in relation to the name 'Forsyte' or 'Forsyth'; it meant the same to him, and it was entirely to him that I owed my acquaintance with the name. The remarkable fact was that he brought the name into the analysis unheralded, only the briefest time after it had become significant to me in another sense owing to a new event – the London doctor's arrival. But the manner in which the name emerged in his analytic session is [51]
perhaps not less interesting than the fact itself. He did not say, for instance: 'The name "Forsyte", out of the novels you are familiar with, has just occurred to me.' He was able, without any conscious relation to that source, to weave the name into his own experiences and to produce it thence – a thing that might have happened long before but had not happened till then. What he *did* say now was: 'I'm a Forsyth too: that's what the girl calls me.' It is hard to mistake the mixture of jealous demand and melancholy self-depreciation which finds its expression in this remark. We shall not be going astray if we complete it in some such way as this: 'It's mortifying to me that your thoughts should be so intensely occupied with this new arrival. Do come back to me; after all I'm a Forsyth too – though it's true I'm only a Herr von Vorsicht [gentleman of foresight], as the girl says.' And thereupon his train of thought, passing along the associative threads of the element 'English', went back to two earlier events, which were able to stir up the same feelings of jealousy. 'A few days ago you paid a visit to my house – not, alas, to me but to a Herr von Freund.' This thought caused him to distort the name 'Freud' into 'Freund'. The 'Freud-Ottorego' from

the lecture syllabus must come in here because as a teacher of English she provided the manifest association. And now came the recollection of another visitor a few weeks before, of whom he was no doubt equally jealous, but for whom he also felt he was no match, for Dr Jones was able to write a monograph on the nightmare whereas he was at best only able to produce such dreams himself. His mention of his mistake about the meaning of 'a mare's nest' comes into this connection, for it can only mean to say: 'After all I'm not a genuine Englishman any more than I'm a genuine Forsyth.'

Now I cannot describe his feelings of jealousy as either out of place or unintelligible. He had been warned that his analysis, and at the same time our contact, would come to an end as soon as foreign pupils and patients returned to Vienna; and that was in fact what happened shortly afterwards. What we have so far achieved, however, has been a piece of analytic work – the explanation of three associations brought up by him in the same session and nourished by the same motive: and this has not much to do with the other question of whether these associations could
[52] or could not have been made without thought transference. This question arises in the case of each of the three associations and thus falls into three separate questions: Could P. have known that Dr Forsyth had just paid me his first visit? Could he know the name of the person I had visited in his house? Did he know that Dr Jones had written a monograph on the nightmare? Or was it only *my* knowledge about these things that was revealed in his associations? It will depend on the reply to these separate questions whether my observation allows of a conclusion favourable to thought transference.

Let us leave the first question aside for a while; the other two can be dealt with more easily. The case of my visit to his pension makes a particularly convincing impression at first sight. I am certain that in my short, joking reference to my visit to his house I mentioned no name. I think it is most unlikely that P. made enquiries at the pension as to the name of the person concerned; I believe rather that the existence of that person remained entirely unknown to him. But the evidential value of this case is totally destroyed by a chance circumstance. The man whom I had visited at the pension was not only called 'Freund'; he was a true friend to us all.[1] He was Dr Anton von Freund whose donation had made the foundation of our publishing house possible. His early death, together with that of our colleague Karl Abraham a few years later, are the

1 ['*Freund*' is, of course, the German word for 'friend'. Freud wrote a moving obituary of him (1920*c*), *RSE*, **18**, 257 f.]

gravest misfortunes which have befallen the growth of psychoanalysis. It is possible, therefore, that I had said to Herr P.: 'I visited a friend [*Freund*] in your house' and with this possibility the occult interest of his second association vanishes.

The impression made by the third association evaporates equally quickly. Could P. know that Jones had published a monograph on the nightmare if he never read any analytic literature? Yes, he could. He possessed books from our publishing house and could in any case have seen the titles of the new publications advertised on the wrappers. This cannot be proved, but neither can it be disproved. We can reach no decision, therefore, along this path. To my regret, this observation of mine suffers from the same weakness as so many similar ones: it was written down too late and was discussed at a time when I was no longer seeing Herr P. and could not question him further.

Let us go back to the first event, which even taken by itself supports [53]
the apparent fact of thought transference. Could P. know that Dr Forsyth had been with me a quarter of an hour before him? Could he have any knowledge at all of his existence or of his presence in Vienna? We must not give way to an inclination to deny both questions flatly. I can see a way that leads to a partly affirmative answer. I may after all have told Herr P. that I was expecting a doctor from England for instruction in analysis, as a first dove after the Deluge. This might have happened in the summer of 1919, for Dr Forsyth had made arrangements with me by letter some months before his arrival. I may even have mentioned his name, though that seems to me most improbable. In view of the other connection which the name carried for both of us, a discussion of it must inevitably have followed, of which something would have remained in my memory. Nevertheless, such a discussion may have taken place and I may have totally forgotten it afterwards, so that it became possible for the emergence of 'Herr von Vorsicht' in the analytic session to strike me as a miracle. If one regards oneself as a sceptic, it is a good plan to have occasional doubts about one's scepticism too. It may be that I too have a secret inclination towards the miraculous which thus goes halfway to meet the creation of occult facts.

If we have thus got one miraculous possibility out of the way, there is another waiting for us, and the most difficult of all. Assuming that Herr P. knew that there was a Dr Forsyth and that he was expected in Vienna in the autumn, how is it to be explained that he became receptive to his presence on the very day of his arrival and immediately after his first visit? One might say it was chance – that is, leave it unexplained. But it

was precisely in order to exclude chance that I discussed P.'s other two associations, in order to show you that he was really occupied with jealous thoughts about people who visited me. Or one might, not to neglect the most extreme possibility, experiment with the hypothesis that P. had observed a special excitement about me (which, to be sure, I myself knew nothing of) and drew his conclusion from it. Or Herr P. (though he arrived a quarter of an hour after the Englishman left) met him on the short stretch of street which they both had to pass along,
[54] recognized him by his characteristically English appearance and, being in a permanent state of jealous expectation, thought: 'Ah, so that's Dr Forsyth with whose arrival my analysis is to come to an end! And he's probably just come straight from the Professor.' I cannot carry these rationalistic speculations any further. We are once again left with a *non liquet* [not proven]; but I must confess that I have a feeling that here too the scales weigh in favour of thought transference. Moreover, I am certainly not alone in having been in the position of experiencing 'occult' events like this in the analytic situation. Helene Deutsch published some similar observations in 1926 and studied the question of their being determined by the transference relations between patient and analyst.

I am sure you will not feel very well satisfied with my attitude to this problem – with my not being entirely convinced but prepared to be convinced. You may perhaps say to yourselves: 'Here's another case of a man who has done honest work as a scientist all through his life and has grown feeble-minded, pious and credulous in his old age.' I am aware that a few great names must be included in this class, but you should not reckon me among them. At least I have not become pious, and I hope not credulous. It is only that, if one has gone about all one's life bending in order to avoid a painful collision with the facts, so too in one's old age one still keeps one's back ready to bow before new realities. No doubt you would like me to hold fast to a moderate theism and show myself relentless in my rejection of everything occult. But I am incapable of currying favour and I must urge you to have kindlier thoughts on the objective possibility of thought transference and at the same time of telepathy as well.

You will not forget that here I am treating these problems only insofar as it is possible to approach them from the direction of psychoanalysis. When they first came into my range of vision more than ten years ago, I too felt a dread of a threat against our scientific *Weltanschauung*,

which, I feared, was bound to give place to spiritualism or mysticism if portions of occultism were proved true.[1] Today I think otherwise. In my opinion it shows no great confidence in science if one does not think it [55] capable of assimilating and working over whatever may perhaps turn out to be true in the assertions of occultists. And particularly so far as thought transference is concerned, it seems actually to favour the extension of the scientific – or, as our opponents say, the mechanistic – mode of thought to the mental phenomena which are so hard to lay hold of. The telepathic process is supposed to consist in a mental act in one person instigating the same mental act in another person. What lies between these two mental acts may easily be a physical process into which the mental one is transformed at one end and which is transformed back once more into the same mental one at the other end. The analogy with other transformations, such as occur in speaking and hearing by telephone, would then be unmistakable. And only think if one could get hold of this physical equivalent of the psychical act! It would seem to me that psychoanalysis, by inserting the unconscious between what is physical and what was previously called 'psychical', has paved the way for the assumption of such processes as telepathy. If only one accustoms oneself to the idea of telepathy, one can accomplish a great deal with it – for the time being, it is true, only in imagination. It is a familiar fact that we do not know how the common purpose comes about in the great insect communities: possibly it is done by means of a direct psychical transference of this kind. One is led to a suspicion that this is the original, archaic method of communication between individuals and that in the course of phylogenetic evolution it has been replaced by the better method of giving information with the help of signals which are picked up by the sense organs. But the older method might have persisted in the background and still be able to put itself into effect under certain conditions – for instance, in passionately excited mobs. All this is still uncertain and full of unsolved riddles; but there is no reason to be frightened by it.

If there is such a thing as telepathy as a real process, we may suspect that, in spite of its being so hard to demonstrate, it is quite a common phenomenon. It would tally with our expectations if we were able to point to it particularly in the mental life of children. Here we are reminded of the frequent anxiety felt by children over the idea that their parents know all their thoughts without having to be told [56]

1 [These thoughts were expressed by Freud at considerable length in the introductory portion of his posthumously published paper on 'Psychoanalysis and Telepathy' (1941*d*), *RSE*, **18**, 167–71.]

them – an exact counterpart and perhaps the source of the belief of adults in the omniscience of God. A short time ago Dorothy Burlingham, a trustworthy witness, in a paper on child analysis and the mother [1932] published some observations which, if they can be confirmed, would be bound to put an end to the remaining doubts on the reality of thought transference. She made use of the situation, no longer a rare one, in which a mother and child are simultaneously in analysis, and reported some remarkable events such as the following. One day the mother spoke during her analytic session of a gold coin that had played a particular part in one of the scenes of her childhood. Immediately afterwards, after she had returned home, her little boy, about ten years old, came to her room and brought her a gold coin which he asked her to keep for him. She asked him in astonishment where he had got it from. He had been given it on his birthday; but his birthday had been several months earlier and there was no reason why the child should have remembered the gold coin precisely then. The mother reported the occurrence to the child's analyst and asked her to find out from the child the reason for his action. But the child's analysis threw no light on the matter; the action had forced its way that day into the child's life like a foreign body. A few weeks later the mother was sitting at her writing desk to write down, as she had been told to do, an account of the experience, when in came the boy and asked for the gold coin back, as he wanted to take it with him to show in his analytic session. Once again the child's analysis could discover no explanation of his wish.

And this brings us back to psychoanalysis, which was what we started out from.

LECTURE XXXI

THE DISSECTION OF THE PSYCHICAL PERSONALITY[1]

Ladies and Gentlemen, I know you are aware in regard to your own [57]
relations, whether with people or things, of the importance of your starting point. This was also the case with psychoanalysis. It has not been a matter of indifference for the course of its development or for the reception it met with that it began its work on what is, of all the contents of the mind, most foreign to the ego – on symptoms. Symptoms are derived from the repressed, they are, as it were, its representatives before the ego; but the repressed is foreign territory to the ego – internal foreign territory – just as reality (if you will forgive the unusual expression) is external foreign territory. The path led from symptoms to the unconscious, to the life of the drives, to sexuality; and it was then that psychoanalysis was met with the brilliant objection that human beings are not merely sexual creatures but have nobler and higher impulses as well. It might have been added that, exalted by their consciousness of these higher impulses, they often assume the right to think nonsense and to neglect facts.

You know better. From the very first we have said that human beings fall ill of a conflict between the claims of the life of the drives and the resistance which arises within them against it; and not for a moment have we forgotten this resisting, repelling, repressing agency, which we thought of as equipped with its special forces, the ego drives, and which coincides with the ego[2] of popular psychology. The truth was merely that, in view of the laborious nature of the progress made by scientific work, even psychoanalysis was not able to study every field simultaneously and to express its views on every problem in a single breath. But at last the point was reached when it was possible for us to divert our [58]
attention from the repressed to the repressing forces, and we faced this ego, which had seemed so self-evident, with the secure expectation that

1 [The greater part of the material in this lecture is derived (with some amplifications) from Chapters I, II, III and V of *The Ego and the Id* (1923*b*), *RSE*, **19**, 11 ff., 16 ff., 24 ff. and 43 ff.]

2 [*Ich*, literally 'I'. See ibid., **24**, 68–71.]

here once again we should find things for which we could not have been prepared. It was not easy, however, to find a first approach; and that is what I intend to talk to you about today.

I must, however, let you know of my suspicion that this account of mine of ego psychology will affect you differently from the introduction into the psychical underworld which preceded it. I cannot say with certainty why this should be so. I thought first that you would discover that whereas what I reported to you previously were, in the main, facts, however strange and peculiar, now you will be listening principally to opinions – that is, to speculations. But that does not meet the position. After further consideration I must maintain that the amount of intellectual working over of the factual material in our ego psychology is not much greater than it was in the psychology of the neuroses. I have been obliged to reject other explanations as well of the result I anticipate: I now believe that it is somehow a question of the nature of the material itself and of our being unaccustomed to dealing with it. In any case, I shall not be surprised if you show yourselves even more reserved and cautious in your judgement than hitherto.

The situation in which we find ourselves at the beginning of our enquiry may be expected itself to point the way for us. We wish to make the ego the matter of our enquiry, our very own ego. But is that possible? After all, the ego is in its very essence a subject; how can it be made into an object? Well, there is no doubt that it can be. The ego can take itself as an object, can treat itself like other objects, can observe itself, criticize itself, and do heaven knows what with itself. In this, one part of the ego is setting itself over against the rest. So the ego can be split; it splits itself during a number of its functions – temporarily at least. Its parts can come together again afterwards. That is not exactly a novelty, though it may perhaps be putting an unusual emphasis on what is generally known. On the other hand, we are familiar with the notion that pathology, by making things larger and coarser, can draw our attention to normal conditions which would otherwise have escaped us. Where it
[59] points to a breach or a rent, there may normally be an articulation present. If we throw a crystal to the floor, it breaks; but not into haphazard pieces. It comes apart along its lines of cleavage into fragments whose boundaries, though they were invisible, were predetermined by the crystal's structure. Mental patients are split and broken structures of this same kind. Even we cannot withhold from them something of the reverential awe which peoples of the past felt for the insane. They

have turned away from external reality, but for that very reason they know more about internal, psychical reality and can reveal a number of things to us that would otherwise be inaccessible to us.

We describe one group of these patients as suffering from delusions of being observed. They complain to us that perpetually, and down to their most intimate actions, they are being molested by the observation of unknown powers – presumably persons – and that in hallucinations they hear these persons reporting the outcome of their observation: 'now he's going to say this, now he's dressing to go out' and so on. Observation of this sort is not yet the same thing as persecution, but it is not far from it; it presupposes that people distrust them, and expect to catch them carrying out forbidden actions for which they would be punished. How would it be if these insane people were right, if in each of us there is present in his ego an agency like this which observes and threatens to punish, and which in them has merely become sharply divided from their ego and mistakenly displaced into external reality?

I cannot tell whether the same thing will happen to you as to me. Ever since, under the powerful impression of this clinical picture, I formed the idea that the separation of the observing agency from the rest of the ego might be a regular feature of the ego's structure, that idea has never left me, and I was driven to investigate the further characteristics and connections of the agency which was thus separated off. The next step is quickly taken. The content of the delusions of being observed already suggests that the observing is only a preparation for judging and punishing, and we accordingly guess that another function of this agency must be what we call our conscience. There is scarcely anything else in us that we so regularly separate from our ego and so easily set over against it as precisely our conscience. I feel an inclination to do something that I think will give me pleasure, but I abandon it on the ground [60]
that my conscience does not allow it. Or I have let myself be persuaded by too great an expectation of pleasure into doing something to which the voice of conscience has objected and after the deed my conscience punishes me with distressing reproaches and causes me to feel remorse for the deed. I might simply say that the special agency which I am beginning to distinguish in the ego is conscience. But it is more prudent to keep the agency as something independent and to suppose that conscience is one of its functions and that self-observation, which is an essential preliminary to the judging activity of conscience, is another of them. And since when we recognize that something has a separate

existence we give it a name of its own, from this time forward I will describe this agency in the ego as the '*superego*'.

I am now prepared to hear you ask me scornfully whether our ego psychology comes down to nothing more than taking commonly used abstractions literally and in a crude sense, and transforming them from concepts into things – by which not much would be gained. To this I would reply that in ego psychology it will be difficult to escape what is universally known; it will rather be a question of new ways of looking at things and new ways of arranging them than of new discoveries. So hold to your contemptuous criticism for the time being and await further explanations. The facts of pathology give our efforts a background that you would look for in vain in popular psychology. So I will proceed.

Hardly have we familiarized ourselves with the idea of a superego like this which enjoys a certain degree of autonomy, follows its own intentions and is independent of the ego for its supply of energy, than a clinical picture forces itself on our notice which throws a striking light on the severity of this agency and indeed its cruelty, and on its changing relations to the ego. I am thinking of the condition of melancholia,[1] or, more precisely, of melancholic attacks, which you too will have heard plenty about, even if you are not psychiatrists. The most striking feature of this illness, of whose causation and mechanism we know much too little, is the way in which the superego – 'conscience', you may call it, quietly – treats the ego. While a melancholic can, like other people,
[61] show a greater or lesser degree of severity to himself in his healthy periods, during a melancholic attack his superego becomes over-severe, abuses the poor ego, humiliates it and ill-treats it, threatens it with the direst punishments, reproaches it for actions in the remotest past which had been taken lightly at the time – as though it had spent the whole interval in collecting accusations and had only been waiting for its present access to strength in order to bring them up and make a condemnatory judgement on their basis. The superego applies the strictest moral standard to the helpless ego which is at its mercy; in general it represents the claims of morality, and we realize all at once that our moral sense of guilt is the expression of the tension between the ego and the superego. It is a most remarkable experience to see morality, which is supposed to have been given us by God and thus deeply implanted in us, functioning [in these patients][t] as a periodic phenomenon. For after a certain number of months the whole moral fuss is over, the criticism of the superego is silent, the ego is rehabilitated and again enjoys all the

1 [Modern terminology would most commonly speak of 'depression'.]

rights of man till the next attack. In some forms of the disease, indeed, something of a contrary sort occurs in the intervals; the ego finds itself in a blissful state of intoxication, it celebrates a triumph, as though the superego had lost all its strength or had melted into the ego; and this liberated, manic ego permits itself a truly uninhibited satisfaction of all its appetites. Here are happenings rich in unsolved riddles!

No doubt you will expect me to give you more than a mere illustration when I inform you that we have found out all kinds of things about the formation of the superego – that is to say, about the origin of conscience. Following [*In Anlehnung an*][T] a well-known pronouncement of Kant's which couples the conscience within us with the starry heavens, a pious man might well be tempted to honour these two things as the masterpieces of creation. The stars are indeed magnificent, but as regards conscience God has done an uneven and careless piece of work, for a large majority of men have brought along with them only a modest amount of it or scarcely enough to be worth mentioning. We are far from overlooking the portion of psychological truth that is contained in the assertion that conscience is of divine origin; but the thesis needs interpretation. Even if conscience is something 'within us', yet it is not so from the first. In this it is a real contrast to sexual life, which is in fact [62]
there from the beginning of life and not only a later addition. But, as is well known, young children are amoral and possess no internal inhibitions against their impulses striving for pleasure. The part which is later taken on by the superego is played to begin with by an external power, by parental authority. Parental influence governs the child by offering proofs of love and by threatening punishments which are signs to the child of loss of love and are bound to be feared on their own account. This realistic anxiety is the precursor of the later moral anxiety.[1] So long as it is dominant there is no need to talk of a superego and of a conscience. It is only subsequently that the secondary situation develops (which we are all too ready to regard as the normal one), where the external restraint is internalized and the superego takes the place of the parental agency and observes, directs and threatens the ego in exactly the same way as earlier the parents did with the child.

The superego, which thus takes over the power, function and even the methods of the parental agency, is however not merely its successor but actually the legitimate heir to its body. It proceeds directly out of it, we shall learn presently by what process. First, however, we must dwell

1 ['*Gewissensangst*', literally 'conscience anxiety'. Some discussion of the word can be found in an Editors' footnote to *Inhibitions, Symptoms and Anxiety* (1926*d*), *RSE*, **20**, 114 *n.* 1.]

upon a discrepancy between the two. The superego seems to have made a one-sided choice and to have picked out only the parents' strictness and severity, their prohibiting and punitive function, whereas their loving care seems not to have been taken over and maintained. If the parents have really enforced their authority with severity we can easily understand the child's in turn developing a severe superego. But, contrary to our expectation, experience shows that the superego can acquire the same characteristic of relentless severity even if the upbringing had been mild and kindly and had so far as possible avoided threats and punishments. We shall come back later to this contradiction when we deal with the transformations of drive during the formation of the superego.[1]

[63] I cannot tell you as much as I should like about the metamorphosis of the parental relationship into the superego, partly because that process is so complicated that an account of it will not fit into the framework of an introductory course of lectures such as I am trying to give you, but partly also because we ourselves do not feel sure that we understand it completely. So you must be content with the sketch that follows.

The basis of the process is what is called an 'identification' – that is to say, the assimilation of one ego to another one,[2] as a result of which the first ego behaves like the second in certain respects, imitates it and in a sense takes it up into itself. Identification has been not unsuitably compared with the oral, cannibalistic incorporation of the other person. It is a very important form of attachment to someone else, probably the very first, and not the same thing as the choice of an object. The difference between the two can be expressed in some such way as this. If a boy identifies himself with his father, he wants to *be like* his father; if he makes him the object of his choice, he wants to *have* him, to possess him. In the first case his ego is altered on the model of his father; in the second case that is not necessary. Identification and object choice are to a large extent independent of each other; it is, however, possible to identify oneself with someone whom, for instance, one has taken as a sexual object, and to alter one's ego on his model. It is said that the influencing of the ego by the sexual object occurs particularly often with women and is characteristic of femininity. I must already have spoken to you in my earlier lectures of what is by far the most instructive relation between identification and object choice. It can be observed equally easily in children and adults, in normal as in sick people. If one has lost

1 [See pp. 96–7 below.]

2 [I.e. one ego coming to resemble another one.]

an object or has been obliged to give it up, one often compensates oneself by identifying oneself with it and by setting it up once more in one's ego, so that here object choice regresses, as it were, to identification.[1]

I myself am far from satisfied with these remarks on identification; but it will be enough if you can grant me that the installation of the superego can be described as a successful instance of identification with [64]
the parental agency. The fact that speaks decisively for this view is that this new creation of a superior agency within the ego is most intimately linked to the destiny of the Oedipus complex, so that the superego appears as the heir to that emotional attachment which is of such importance for childhood. With his abandonment [*Auflassen*] of the Oedipus complex a child must, as we can see, renounce the intense object cathexes which he has deposited with his parents, and it is as a compensation for this loss of objects that there is such a strong intensification of the identifications with his parents which have probably long been present in his ego. Identifications of this kind as precipitates of object cathexes that have been given up will be repeated often enough later in the child's life; but it is entirely in accordance with the emotional importance of this first instance of such a transformation that a special place in the ego should be found for its outcome. Close investigation has shown us, too, that the superego is stunted in its strength and growth if the surmounting of the Oedipus complex is only incompletely successful. In the course of development the superego also takes on the influences of those who have stepped into the place of parents – educators, teachers, people chosen as ideal models. Normally it departs more and more from the original parental figures; it becomes, so to say, more impersonal. Nor must it be forgotten that a child has a different estimate of its parents at different periods of its life. At the time at which the Oedipus complex gives place to the superego they are something quite magnificent; but later they lose much of this. Identifications then come about with these later parents as well, and indeed they regularly make important contributions to the formation of character; but in that case they affect only the ego, they no longer influence the superego, which has been determined by the earliest parental imagos.[2]

1 [The matter is, in fact, alluded to only very briefly in the *Introductory Lectures* (see the later part of Lecture XXVI; *RSE*, **16**, 377–8). Identification was the subject of Chapter VII of *Group Psychology* (1921*c*), ibid., **18**, 97 ff. It was also succinctly discussed in Freud's contribution to a biography of Woodrow Wilson, pp. 183–90 below. The formation of the superego was discussed at length in Chapter III of *The Ego and the Id* (1923*b*), *RSE*, **19**, 24 ff.]

2 [This point was discussed by Freud in a paper on 'The Economic Problem of Masochism' (1924*c*), ibid., **19**, 159, where, incidentally, an editorial footnote deals with Freud's use of the term 'imago'.]

I hope you have already formed an impression that the hypothesis [*Aufstellung*][t] of the superego really describes a structural relation and is not merely a personification of some such abstraction as that of conscience. One more important function remains to be mentioned which
[65] we attribute to this superego. It is also the vehicle of the ego ideal by which the ego measures itself, which it emulates, and whose demand for ever greater perfection it strives to fulfil. There is no doubt that this ego ideal is the precipitate of the old picture of the parents, the expression of admiration for the perfection which the child then attributed to them.[1]

I am sure you have heard a great deal of the sense of inferiority which is supposed particularly to characterize neurotics. It especially haunts the pages of what are known as *belles lettres*. An author who uses the term 'inferiority complex' thinks that by so doing he has fulfilled all the demands of psychoanalysis and has raised his composition to a higher psychological plane. In fact, 'inferiority complex' is a technical term that is scarcely used in psychoanalysis. For us it does not bear the meaning of anything simple, let alone elementary. To trace it back to the self-perception of possible organic defects, as the school of what are known as 'Individual Psychologists'[2] likes to do, seems to us a short-sighted error. The sense of inferiority has strong erotic roots. A child feels inferior if he notices that he is not loved, and so does an adult. The only bodily organ which is really regarded as inferior is the atrophied penis, a girl's clitoris.[3] But the major part of the sense of inferiority
[66] derives from the ego's relation to its superego; like the sense of guilt it is an expression of the tension between them. Altogether, it is hard to separate the sense of inferiority and the sense of guilt. It would perhaps

1 [There is some obscurity in this passage, and in particular over the phrase '*der Träger des Ichideals*', here translated 'the vehicle of the ego ideal'. When Freud first introduced the concept in his paper on narcissism (1914*c*), he distinguished between the ego ideal itself and 'a special psychical agency which performs the task of seeing that narcissistic satisfaction from the ego ideal is ensured and which, with this end in view, constantly watches the actual ego and measures it by that ideal' (*RSE*, **14**, 83). Similarly in Lecture XXVI of the *Introductory Lectures* (1916–17*a*), ibid., **16**, 378, he speaks of a person sensing 'an agency holding sway in his ego which measures his actual ego and each of its activities by an *ideal ego* that he has created for himself in the course of his development'. In some of Freud's later writings this distinction between the ideal and the agency enforcing it became blurred. It seems possible that it is revived here and that the superego is being identified with the enforcing agency. The use of the term '*Idealfunktion*' three paragraphs lower down (p. 59) raises the same question. The whole subject was discussed in the Editors' Introduction to *The Ego and the Id* (1923*b*), ibid., **19**, 8–9.]

2 [Their views are discussed in Lecture XXXIV, p. 123 ff. below.]

3 [Cf. a footnote of Freud's to his paper on the anatomical distinction between the sexes (1925*j*), *RSE*, **19**, 254 *n.* 3.]

be right to regard the former as the erotic complement to the moral sense of inferiority. Little attention has been given in psychoanalysis to the question of the de-limitation of the two concepts.

If only because the inferiority complex has become so popular, I will venture to entertain you here with a short digression. A historical personality of our own days, who is still alive though at the moment he has retired into the background, suffers from a defect in one of his limbs owing to an injury at the time of his birth. A very well-known contemporary writer who is particularly fond of compiling the biographies of celebrities has dealt, among others, with the life of the man I am speaking of.[1] Now in writing a biography it may well be difficult to suppress a need to plumb the psychological depths. For this reason our author has ventured on an attempt to erect the whole of the development of his hero's character on the sense of inferiority which must have been called up by his physical defect. In doing so, he has overlooked one small but not insignificant fact. It is usual for mothers whom Fate [*Schicksal*][T] has presented with a child who is sickly or otherwise at a disadvantage to try to compensate him for his unfair handicap by a superabundance of love. In the instance before us, the proud mother behaved otherwise; she withdrew her love from the child on account of his infirmity. When he had grown up into a man of great power, he proved unambiguously by his actions that he had never forgiven his mother. When you consider the importance of a mother's love for the mental life of a child, you will no doubt make a tacit correction of the biographer's inferiority theory.

But let us return to the superego. We have allotted it the functions of self-observation, of conscience and of [maintaining] the ideal.[2] It follows from what we have said about its origin that it presupposes an immensely important biological fact and a fateful psychological one: namely, the human child's long dependence on its parents and the Oedipus complex, both of which, again, are intimately interconnected. The superego is the representative for us of every moral restriction, the [67]
advocate of a striving towards perfection – it is, in short, as much as we have been able to grasp psychologically of what is described as the higher side of human life. Since it itself goes back to the influence of parents, educators and so on, we learn still more of its significance if we turn to those who are its sources. As a rule parents and authorities

1 [*Wilhelm II*, by Emil Ludwig (1926).]

2 ['*Idealfunktion*.' Cf. footnote 1, p. 58 above.]

analogous to them follow the precepts of their own superegos in educating children. Whatever understanding their ego may have come to with their superego, they are severe and exacting in educating children. They have forgotten the difficulties of their own childhood and they are glad to be able now to identify themselves fully with their own parents who in the past laid such severe restrictions upon them. Thus a child's superego is in fact constructed on the model not of its parents but of its parents' superego; the contents which fill it are the same and it becomes the vehicle of tradition and of all the time-resisting judgements of value which have propagated themselves in this manner from generation to generation. You may easily guess what important assistance taking the superego into account will give us in our understanding of the social behaviour of mankind – in the problem of delinquency, for instance – and perhaps even what practical hints on education. It seems likely that what are known as materialistic views of history sin in underestimating this factor. They brush it aside with the remark that human 'ideologies' are nothing other than the product and superstructure of their contemporary economic conditions. That is true, but very probably not the whole truth. Mankind never lives entirely in the present. The past, the tradition of the race and of the people, lives on in the ideologies of the superego, and yields only slowly to the influences of the present and to new changes; and so long as it operates through the superego it plays a powerful part in human life, independently of economic conditions. [Cf. p. 156 ff. below.]

In 1921 I endeavoured to make use of the differentiation between the ego and the superego in a study of group psychology [*Massenpsychologie*][T]. I arrived at a formula such as this: a psychological group is
Masse
a collection of individuals who have introduced the same person into their superego and, on the basis of this common element, have
[68]
identified themselves with one another in their ego.[1] This applies, of course, only to groups that have a leader. If we possessed more applications of this kind, the hypothesis of the superego would lose its last touch of strangeness for us, and we should become completely free of the embarrassment that still comes over us when, accustomed as we are to the atmosphere of the underworld, we move in the more superficial, higher strata of the mental apparatus. We do not suppose, of course, that with the separation off of the superego we have said the last word on the psychology of the ego. It is rather a first step; but in this case it is not only the first step that is hard.

1 [*Group Psychology* (1921c), *RSE*, **18**, 107 f.]

Now, however, another problem awaits us – at the opposite end of the ego, as we might put it. It is presented to us by an observation during the work of analysis, an observation which is actually a very old one. As not infrequently happens, it has taken a long time to come to the point of appreciating its importance. The whole theory of psychoanalysis is, as you know, in fact built up on the perception of the resistance offered to us by the patient when we attempt to make his unconscious conscious to him. The objective sign of this resistance is that his associations fail [*versagen*] or depart widely from the topic that is being dealt with. He may also recognize the resistance *subjectively* by the fact that he has distressing feelings when he approaches the topic. But this last sign may also be absent. We then say to the patient that we infer from his behaviour that he is now in a state of resistance; and he replies that he knows nothing of that, and is only aware that his associations have become more difficult. It turns out that we were right; but in that case his resistance was unconscious too, just as unconscious as the repressed, at the lifting of which we were working. We should long ago have asked the question: from what part of his mind does an unconscious resistance like this arise? The beginner in psychoanalysis will be ready at once with the answer: it is, of course, the resistance of the unconscious. An ambiguous and unserviceable answer! If it means that the resistance arises from the repressed, we must rejoin: certainly not! We must rather attribute to the repressed a strong upward drive, an impulsion to break through into consciousness. The resistance can only be a manifestation of the ego, which originally put the repression into force and now wishes to maintain it. That, moreover, is the view we always took. Since we have come to assume a special agency [69] in the ego, the superego, which represents demands of a restrictive and rejecting character, we may say that repression is the work of this superego and that it is carried out either by itself or by the ego in obedience to its orders. If then we are met with the case of the resistance in analysis not being conscious to the patient, this means either that in quite important situations the superego and the ego can operate unconsciously, or – and this would be more important still – that portions of both of them, the ego and the superego themselves, are unconscious. In both cases we have to reckon with the disagreeable discovery that on the one hand (super)ego and conscious and on the other hand repressed and unconscious are far from coinciding.

And here, ladies and gentlemen, I feel that I must make a pause to take breath – which you too will welcome as a relief – and, before I go on, to apologize to you. My intention is to give you some addenda to the introductory lectures on psychoanalysis which I began fifteen years ago, and I am obliged to behave as though you as well as I had in the interval done nothing but practise psychoanalysis. I know that that assumption is out of place; but I am helpless, I cannot do otherwise. This is no doubt related to the fact that it is in general so hard to give anyone who is not himself a psychoanalyst an insight into psychoanalysis. You can believe me when I tell you that we do not enjoy giving an impression of being members of a secret society and of practising a mystical science. Yet we have been obliged to recognize and express as our conviction that no-one has a right to join in a discussion of psychoanalysis who has not had particular experiences which can only be obtained by being analysed oneself. When I gave you my lectures fifteen years ago I tried to spare you certain speculative portions of our theory; but it is precisely from them that are derived the new acquisitions of which I must speak to you today.

I return now to our topic. In face of the doubt whether the ego and superego are themselves unconscious or merely produce unconscious effects, we have, for good reasons, decided in favour of the former possibility. And it is indeed the case that large portions of the ego and
[70] superego can remain unconscious and are normally unconscious. That is to say, the individual knows nothing of their contents and it requires an expenditure of effort to make them conscious. It is a fact that ego and conscious, repressed and unconscious do not coincide. We feel a need to make a fundamental revision of our attitude to the problem of conscious–unconscious. At first we are inclined greatly to reduce the value of the criterion of being conscious since it has shown itself so untrustworthy. But we should be doing it an injustice. As may be said of our life, it is not worth much, but it is all we have. Without the illumination thrown by the quality of consciousness, we should be lost in the obscurity of depth psychology; but we must attempt to find our bearings afresh.

There is no need to discuss what is to be called conscious: it is removed from all doubt. The oldest and best meaning of the word 'unconscious' is the descriptive one; we call a psychical process unconscious whose existence we are obliged to assume – for some such reason as that we infer it from its effects – but of which we know

nothing. In that case we have the same relation to it as we have to a psychical process in another person, except that it is in fact one of our own. If we want to be still more correct, we shall modify our assertion by saying that we call a process unconscious if we are obliged to assume that it is being activated *at the moment*, though *at the moment* we know nothing about it. This qualification makes us reflect that the majority of conscious processes are conscious only for a short time; very soon they become *latent*, but can easily become conscious again. We might also say that they had become unconscious, if it were at all certain that in the condition of latency they are still something psychical. So far we should have learnt nothing new; nor should we have acquired the right to introduce the concept of an unconscious into psychology. But then comes the new observation that we were already able to make in parapraxes [*Fehlleistungen*]T. In order to explain a slip of the tongue, for instance, we find ourselves obliged to assume that the intention to make a particular remark was present in the subject. We infer it with certainty from the interference with his remark which has occurred; but the intention did not put itself through and was thus unconscious. If, when we subsequently [*nachträglich*]T put it before the speaker, he recognizes it as one familiar to him, then it was only temporarily unconscious to him; but if he repudiates it as something foreign to him, then it was permanently unconscious.[1] From this experience we retrospectively obtain the right also to pronounce as something unconscious what had been described as latent. A consideration of these dynamic relations permits us now to distinguish two kinds of unconscious – one which is easily, under frequently occurring circumstances, transformed into something conscious, and another with which this transformation is difficult and takes place only subject to a considerable expenditure of effort or possibly never at all. In order to escape the ambiguity as to whether we mean the one or the other unconscious, whether we are using the word in the descriptive or in the dynamic sense, we make use of a permissible and simple way out. We call the unconscious which is only latent, and thus easily becomes conscious, the 'preconscious' and retain the term 'unconscious' for the other. We now have three terms, 'conscious', 'preconscious' and 'unconscious', with which we can get along in our description of mental phenomena. Once again: the preconscious is also unconscious in the purely descriptive sense, but we do not give it that

Nachträglichkeit [71]

1 [Cf. *Introductory Lectures*, IV; *RSE*, **15**, 56 f.]

name, except in talking loosely or when we have to make a defence of the existence in mental life of unconscious processes in general.

You will admit, I hope, that so far that is not too bad and allows of convenient handling. Yes, but unluckily the work of psychoanalysis has found itself compelled to use the word 'unconscious' in yet another, third, sense, and this may, to be sure, have led to confusion. Under the new and powerful impression of there being an extensive and important field of mental life which is normally withdrawn from the ego's knowledge so that the processes occurring in it have to be regarded as unconscious in the truly dynamic sense, we have come to understand the term 'unconscious' in a topographical or systematic sense as well; we have come to speak of a 'system' of the preconscious and a 'system' of the unconscious, of a conflict between the ego and the system *Ucs*., and have used the word more and more to denote a mental province rather than a quality of what is mental. The discovery, actually an inconvenient one, that portions of the ego and superego as well are unconscious in the dynamic sense operates at this
[72] point as a relief – it makes possible the removal of a complication. We perceive that we have no right to name the mental region that is foreign to the ego 'the system *Ucs*.', since the characteristic of being unconscious is not restricted to it. Very well; we will no longer use the term 'unconscious' in the systematic sense and we will give what we have hitherto so described a better name and one no longer open to misunderstanding. Following a verbal usage of Nietzsche's and taking up a suggestion by Georg Groddeck [1923],[1] we will in future call it the 'id'.[2] This impersonal pronoun seems particularly well suited for expressing the main characteristic of this province of the mind – the fact of its being alien to the ego. The superego, the ego and the id – these, then, are the three realms, regions, provinces, into which we divide an individual's mental apparatus, and with the mutual relations of which we shall be concerned in what follows.[3]

But first a short interpolation. I suspect that you feel dissatisfied because the three qualities of the characteristic of consciousness and the three provinces of the mental apparatus do not fall together into three peaceable couples, and you may regard this as in some sense obscuring our

1 [A German physician by whose unconventional ideas Freud was much attracted.]

2 ['*Es*', the ordinary German word for 'it'. See *RSE*, **24**, 71–2.]

3 [A discussion of the development of Freud's views on this subject is given in the Editors' Introduction to *The Ego and the Id* (1923*b*), ibid., **19**, 5–9. It may be remarked that the abbreviation '*Ucs*.', apart from this passage, was not used by Freud after *The Ego and the Id* until a single appearance in *Moses and Monotheism* (1939*a*), Essay III, Part I, Section E; ibid., **23**, 87.]

findings. I do not think, however, that we should regret it, and we should tell ourselves that we had no right to expect any such smooth arrangement. Let me give you an analogy; analogies, it is true, decide nothing, but they can make one feel more at home. I am imagining a country with a landscape of varying configuration – hill country, plains and chains of lakes – and with a mixed population: it is inhabited by Germans, Magyars and Slovaks, who carry on different activities. Now things might be partitioned in such a way that the Germans, who breed cattle, live in the hill country, the Magyars, who grow cereals and wine, live in the plains, and the Slovaks, who catch fish and plait reeds, live [73]
by the lakes. If the partitioning could be neat and clear-cut like this, a Woodrow Wilson would be delighted by it;[1] it would also be convenient for a lecture in a geography lesson. The probability is, however, that you will find less orderliness and more mixing if you travel through the region. Germans, Magyars and Slovaks live interspersed all over it; in the hill country there is agricultural land as well, cattle are bred in the plains too. A few things are naturally as you expected, for fish cannot be caught in the mountains and wine does not grow in the water. Indeed, the picture of the region that you brought with you may on the whole fit the facts; but you will have to put up with deviations in the details.

You will not expect me to have much to tell you that is new about the id apart from its new name. It is the dark, inaccessible part of our personality; what little we know of it we have learnt from our study of the dream-work and of the construction of neurotic symptoms, and most of that is of a negative character and can be described only as a contrast to the ego. We approach the id with analogies: we call it a chaos, a cauldron full of seething excitations [*Erregungen*][T]. We picture it as being open at its end to somatic influences, and as there taking up into itself drive needs which find their psychical expression in it,[2] but we cannot say in what substratum. It is filled with energy reaching it from the drives, but it has no organization, produces no collective will, but only a striving to bring about the satisfaction of the drive needs subject to the observance of the pleasure principle. The logical laws of thought do not apply in the id, and this is true above all of the law of

1 [It may be remarked that only a year or so before writing this Freud had been collaborating with W. C. Bullitt (then American ambassador in Berlin) on the draft of a psychological study of President Wilson, of whose political judgement he was highly critical. See pp. 169–95 below.]

2 [Freud is here regarding drives as something physical, of which mental processes are the representatives. A long discussion of this can be found in the Editors' Note to 'Drives and their Vicissitudes' (1915*c*), *RSE*, **14**, 99 ff.]

contradiction. Contrary impulses [*Regungen*]^{T} exist side by side, without cancelling each other out or diminishing each other: at the most they may converge to form compromises under the dominating economic pressure [*Zwang*]^{T} towards the discharge [*Abfuhr*]^{T} of energy. [74] There is nothing in the id that could be compared with negation; and we perceive with surprise an exception to the philosophical theorem that space and time are necessary forms of our mental acts.[1] There is nothing in the id that corresponds to the idea of time [*Zeitvorstellung*]^{T}; *Vorstellung* there is no recognition of the passage of time, and – a thing that is most remarkable and awaits consideration in philosophical thought – no alteration in its mental processes is produced by the passage of time.[2] Wishful impulses which have never passed beyond the id, but impressions, too, which have been sunk into the id by repression, are virtually immortal; after the passage of decades they behave as though they had just occurred. They can only be recognized as belonging to the past, can only lose their importance and be deprived of their cathexis of energy, when they have been made conscious by the work of analysis, and it is on this that the therapeutic effect of analytic treatment rests to no small extent.

Again and again I have had the impression that we have made too little theoretical use of this fact, established beyond any doubt, of the unalterability by time of the repressed. This seems to offer an approach to the most profound discoveries. Nor, unfortunately, have I myself made any progress here.

The id, of course, knows no judgements of value: no good and evil, no morality. The economic or, if you prefer, the quantitative factor, which is intimately linked to the pleasure principle, dominates all its processes. Drive cathexes seeking discharge – that, in our view, is all there is in the id. It even seems that the energy of these drive impulses is in a state different from that in the other regions of the mind, far more mobile and capable of discharge;[3] otherwise the displacements [75] and condensations would not occur which are characteristic of the id

1 [The reference is to Kant. Cf. *Beyond the Pleasure Principle* (1920*g*), *RSE*, **18**, 28.]

2 [A full list of Freud's very frequent references to this matter, going back to his earliest writings, is given in Section V of 'The Unconscious' (1915*e*), ibid., **14**, 165 *n.* 3.]

3 [This difference was referred to by Freud in many passages. See, in particular, Section V of the metapsychological paper on 'The Unconscious' (1915*e*), ibid., **14**, 166, and *Beyond the Pleasure Principle* (1920*g*), ibid., **18**, 26–7. In both these passages Freud attributes the distinction to Breuer, apparently having in mind a footnote to Breuer's theoretical contribution to *Studies on Hysteria* (1895*d*), ibid., **2**, 173 *n.* In 'The Unconscious' he remarks that in his opinion this distinction represents the deepest insight we have gained up to the present into the nature of nervous energy. Cf. a further footnote on p. 79 below.]

and which so completely disregard the *quality* of what is cathected – what in the ego we should call an idea. We would give much to understand more about these things! You can see, incidentally, that we are in a position to attribute to the id characteristics other than that of its being unconscious, and you can recognize the possibility of portions of the ego and superego being unconscious without possessing the same primitive and irrational characteristics.[1]

We can best arrive at the characteristics of the actual ego, insofar as it can be distinguished from the id and from the superego, by examining its relation to the outermost superficial portion of the mental apparatus, which we describe as the system *Pcpt.-Cs*.[2] This system is turned towards the external world, it is the medium for the perceptions arising thence, and during its functioning the phenomenon of consciousness arises in it. It is the sense organ of the entire apparatus; moreover it is receptive not only to excitations from outside but also to those arising from the interior of the mind. We need scarcely look for a justification of the view that the ego is that portion of the id which was modified by the proximity and influence of the external world, which is adapted for the reception of stimuli and as a protective shield against stimuli, comparable to the cortical layer by which a small piece of living substance is surrounded. The relation to the external world has become the decisive factor for the ego; it has taken on the task of representing the external world to the id – fortunately for the id, which could not escape destruction if, in its blind efforts for the satisfaction of its drives, it disregarded that supreme external power. In accomplishing this function, the ego must observe the external world, must lay down an accurate picture of it in the memory traces of its perceptions, and by its exercise of the function of 'reality-testing'[3] must put aside whatever in this picture of the external world is an addition derived from internal sources of excitation. The ego controls the approaches to motility under the id's [76]
orders; but between a need and an action it has interposed a postponement in the form of the activity of thought,[4] during which it makes use of the mnemic residues of experience. In that way it has dethroned the pleasure principle which dominates the course of events in the id without any restriction and has replaced it with the reality principle, which promises more certainty and greater success.

1 [This account of the id is in the main based on Section V of the paper on 'The Unconscious'.]

2 [Perception-Consciousness.]

3 [See footnote 1, p. 30 above.]

4 [This is further discussed below, p. 79.]

The relation to time, which is so hard to describe, is also introduced into the ego by the perceptual system; it can scarcely be doubted that the mode of operation of that system is what provides the origin of the idea of time.[1] But what distinguishes the ego from the id quite especially is a tendency to synthesis in its contents, to a combination and unification in its mental processes which are totally lacking in the id. When presently we come to deal with the drives in mental life we shall, I hope, succeed in tracing this essential characteristic of the ego back to its source.[2] It alone produces the high degree of organization which the ego needs for its best achievements. The ego develops from perceiving the drives to controlling them; but this last is achieved only by the [psychical] representative of the drive[3] being allotted its proper place in a considerable assemblage, by its being taken up into a coherent context. To adopt a popular mode of speaking, we might say that the ego stands for reason and good sense while the id stands for the untamed passions.

So far we have allowed ourselves to be impressed by the merits and capabilities of the ego; it is now time to consider the other side as well.
[77] The ego is after all only a portion of the id, a portion that has been expediently modified by the proximity of the external world with its threat of danger. From a dynamic point of view it is weak, it has borrowed its energies from the id, and we are not entirely without insight into the methods – we might call them dodges – by which it extracts further amounts of energy from the id. One such method, for instance, is by identifying itself with actual or abandoned objects. The object cathexes spring from the drive demands of the id. The ego has in the first instance to take note of them. But by identifying itself with the object it recommends itself to the id in place of the object and seeks to divert the id's libido on to itself. We have already seen [p. 57 above] that in the course of its life the ego takes into itself a large number of precipitates like this of former object cathexes. The ego must on the whole carry out the id's intentions, it fulfils its task by finding out the

1 [Freud gave some indication of what he had in mind by this in his paper on the 'Mystic Writing-Pad' (1925*a*), *RSE*, **19**, 231.]

2 [Freud does not seem, in fact, to have returned to the subject in these lectures. – He had discussed this characteristic of the ego at length in Chapter III of *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 86 ff. Though he had stressed the synthetic tendency of the ego particularly in his later writings (e.g. among many others in *The Question of Lay Analysis* (1926*e*), ibid., **20**, 174 f.), the concept was implicit in his picture of the ego from the earliest times. See, for instance, the term he almost invariably used during the Breuer period for ideas that had to be repressed: 'incompatible' – i.e. that could not be synthesized by the ego. So in the first paper on the neuropsychoses of defence (1894*a*), ibid., **3**, 48 *n*. 4.]

3 [See footnote 2, p. 65 above.]

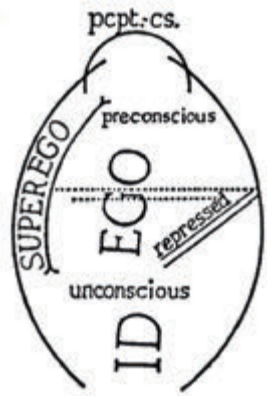
circumstances in which those intentions can best be achieved. The ego's relation to the id might be compared with that of a rider to his horse. The horse supplies the locomotive energy, while the rider has the privilege of deciding on the goal and of guiding the powerful animal's movement. But only too often there arises between the ego and the id the not precisely ideal situation of the rider being obliged to guide the horse along the path by which it itself wants to go.

There is one portion of the id from which the ego has separated itself by resistances due to repression. But the repression is not carried over into the id: the repressed merges into the remainder of the id.

We are warned by a proverb against serving two masters at the same time. The poor ego has things even worse: it serves three severe masters and does what it can to bring their claims and demands into harmony with one another. These claims are always divergent and often seem incompatible. No wonder that the ego so often fails in its task. Its three tyrannical masters are the external world, the superego and the id. When we follow the ego's efforts to satisfy them simultaneously – or rather, to obey them simultaneously – we cannot feel any regret at having personified this ego and having set it up as a separate organism. It feels hemmed in on three sides, threatened by three kinds of danger, to which, if it is hard pressed, it reacts by generating anxiety. Owing to its origin from the experiences of the perceptual system, it is earmarked [78]
for representing the demands of the external world, but it strives too to be a loyal servant of the id, to remain on good terms with it, to recommend itself to it as an object and to attract its libido to itself. In its attempts to mediate between the id and reality, it is often obliged to cloak the *Ucs*. commands of the id with its own *Pcs*. rationalizations, to conceal the id's conflicts with reality, to profess, with diplomatic disingenuousness, to be taking notice of reality even when the id has remained rigid and unyielding. On the other hand it is observed at every step it takes by the strict superego, which lays down definite standards for its conduct, without taking any account of its difficulties from the direction of the id and the external world, and which, if those standards are not obeyed, punishes it with tense feelings of inferiority and of guilt. Thus the ego, driven by the id, confined by the superego, repulsed by reality, struggles to master its economic task of bringing about harmony among the forces and influences working in and upon it; and we can understand how it is that so often we cannot suppress a cry: 'Life is not easy!' If the ego is obliged to admit its weakness, it breaks out in anxiety – realistic anxiety regarding the external world, moral anxiety regarding

the superego and neurotic anxiety regarding the strength of the passions in the id.

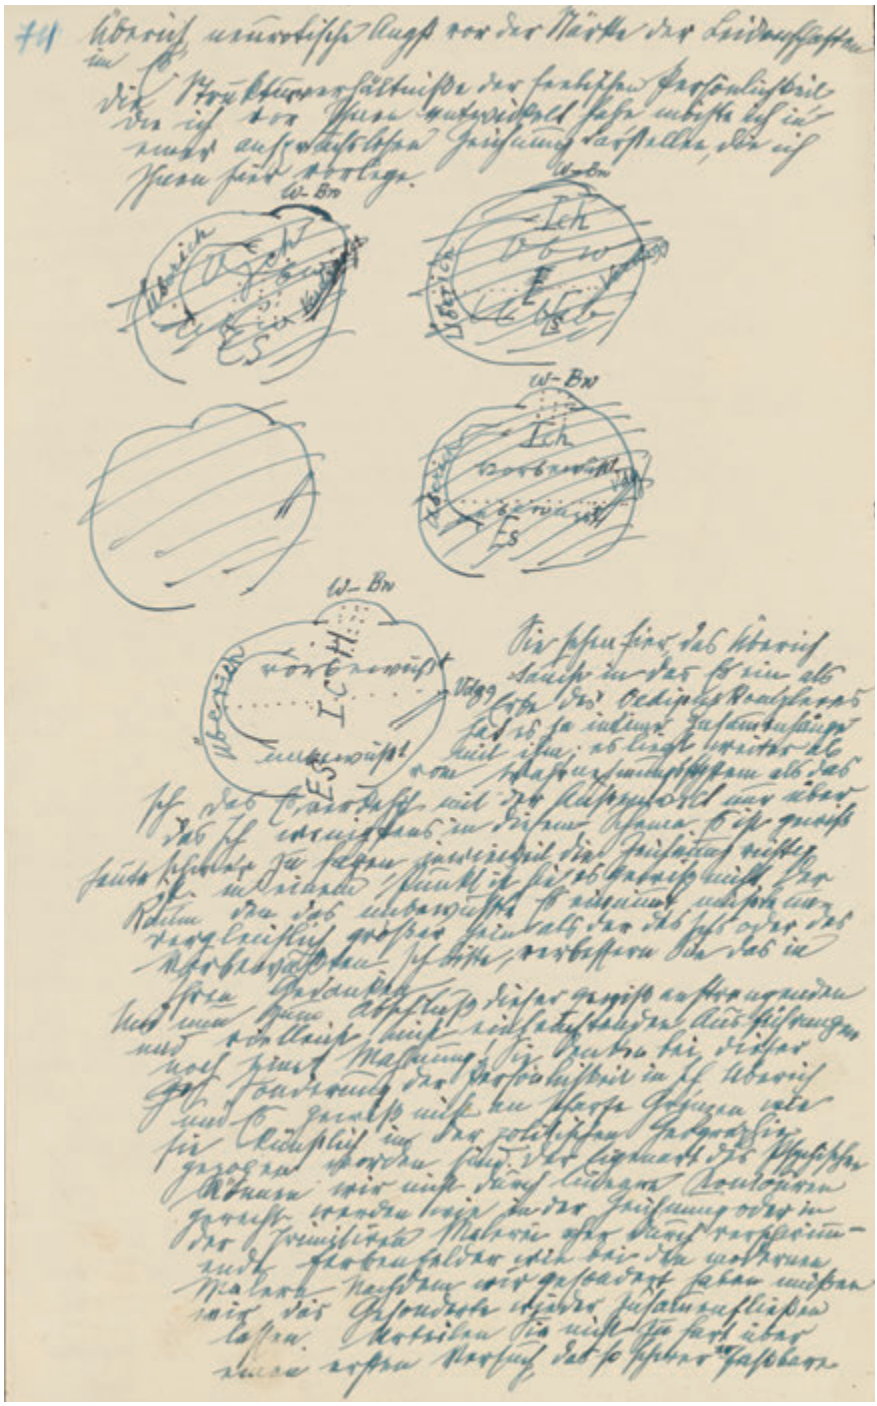
I should like to portray the structural relations of the mental personality, as I have described them to you, in the unassuming sketch which I now present you with:



[79] As you see here, the superego merges into the id; indeed, as heir to the Oedipus complex it has intimate relations with the id; it is more remote than the ego from the perceptual system.[1] The id has intercourse with the external world only through the ego – at least, according to this diagram. It is certainly hard to say today how far the drawing is correct. In one respect it is undoubtedly not. The space occupied by the unconscious id ought to have been incomparably greater than that of the ego or the preconscious. I must ask you to correct it in your thoughts.

And here is another warning, to conclude these remarks, which have certainly been exacting and not, perhaps, very illuminating. In thinking of this division of the personality into an ego, a superego and an id, you will not, of course, have pictured sharp frontiers like the artificial ones drawn in political geography. We cannot do justice to the characteristics of the mind by linear outlines like those in a drawing or in primitive painting, but rather by areas of colour melting into one another as they are presented by modern artists. After making the separation we must

1 [If this diagram is compared with the similar one in *The Ego and the Id* (1923*b*), *RSE*, **19**, 21, it will be seen that the earlier diagram differs principally from the present one in the fact that the superego is not indicated in it. Its absence is justified in a later passage in the same work (ibid., 31 f.). In the original edition of these lectures this picture was printed upright, like its predecessor in *The Ego and the Id*. For some reason, perhaps to economize space, it was turned over on to its side, though otherwise unchanged, in both the *GS* and *GW*.]



Variants of Freud's sketch of the structural relations of the mind

Variants of Freud's sketch of the structural relations of the mind

The main issue Freud struggled with was how to depict the interconnection between what is conscious, preconscious and unconscious on the one hand and what is ego, superego and id on the other. He resolved the matter by denoting the former concepts horizontally and the latter ones vertically. The meaning of the vertical rows of dots within the ego (which, curiously, are not depicted in the printed version) is unclear.

By permission of The Marsh Agency Ltd., on behalf of Sigmund Freud Copyrights.

allow what we have separated to merge together once more. You must not judge too harshly a first attempt at giving a pictorial representation of something so intangible as psychical processes. It is highly probable that the development of these divisions is subject to great variations in different individuals; it is possible that in the course of actual functioning they may change and go through a temporary phase of involution. Particularly in the case of what is phylogenetically the last and most delicate of these divisions – the differentiation between the ego and the superego – something of the sort seems to be true. There is no question but that the same thing results from psychical illness. It is easy to imagine, too, that certain mystical practices may succeed in upsetting the normal relations between the different regions of the mind, so that, for [80] instance, perception may be able to grasp happenings in the depths of the ego and in the id which were otherwise inaccessible to it. It may safely be doubted, however, whether this road will lead us to the ultimate truths from which salvation is to be expected. Nevertheless, it may be admitted that the therapeutic efforts of psychoanalysis have chosen a similar line of approach. Its intention is, indeed, to strengthen the ego, to make it more independent of the superego, to widen its field of perception and enlarge its organization, so that it can appropriate fresh portions of the id.[1] Where id was, there ego shall be.[2] It is a work of culture [*Kulturarbeit*][T] – not unlike the draining of the Zuider Zee. *Kultur*

1 [Freud had said something similar in the last chapter of *The Ego and the Id* (1923*b*), *RSE*, **19**, 50.]

2 ['*Wo Es war, soll Ich werden.*'][t]

LECTURE XXXII

ANXIETY AND THE DRIVES

[81] Ladies and Gentlemen, you will not be surprised to hear that I have a number of novelties to report to you about our conception of anxiety [*Angst*][T] and of the basic drives of mental life; nor will you be surprised to learn that none of these novelties can claim to offer a final solution to these still unsettled problems. I have a particular reason for using the word 'conception' here. These are the most difficult problems that are set to us, but their difficulty does not lie in any insufficiency of observations; what present us with these riddles are actually the commonest and most familiar of phenomena. Nor does the difficulty lie in the recondite nature of the speculations to which they give rise; speculative consideration plays little part in this sphere. But it is truly a matter of conceptions – that is to say, of introducing the right abstract ideas, whose application to the raw material of observation will produce order and clarity in it.

I devoted a lecture (the twenty-fifth) to anxiety in my previous series; and I must briefly recapitulate what I said in it. We described anxiety as an affective state – that is to say, a combination of certain feelings in the pleasure–unpleasure series with the corresponding innervations of discharge and a perception of them, but probably also the precipitate of a particular important event, incorporated by inheritance – something that may thus be likened to an individually acquired hysterical attack.[1] The event which we look upon as having left behind it an affective trace of this sort is the process of birth, at the time of which the effects upon the heart's action and upon respiration characteristic of anxiety were expedient ones. The very first anxiety would thus have been a toxic one. We then started off from a distinction between realistic anxiety and neurotic anxiety, of which the former was a reaction, which seemed
[82] intelligible to us, to a danger – that is, to an expected injury from outside – while the latter was completely enigmatic, and appeared to be pointless.

1 [Cf. the clearer account in *Introductory Lectures*, XXV; *RSE*, **16**, 349.]

In an analysis of realistic anxiety we brought it down to the state of increased sensory attention and motor tension which we describe as 'preparedness of anxiety'. It is out of this that the anxiety reaction develops. Here two outcomes are possible. Either the generation of anxiety – the repetition of the old traumatic experience – is limited to a signal, in which case the remainder of the reaction can adapt itself to the new situation of danger and can proceed to flight or defence; or the old situation can retain the upper hand and the total reaction may consist in no more than a generation of anxiety, in which case the affective state becomes paralysing and will be inexpedient for present purposes.

We then turned to neurotic anxiety and pointed out that we observe it under three conditions. We find it first as a freely floating, general apprehensiveness, ready to attach itself temporarily, in the form of what is known as 'expectant anxiety', to any possibility that may freshly arise – as happens, for instance, in a typical anxiety neurosis. Secondly, we find it firmly attached to certain ideas in the so-called 'phobias', in which it is still possible to recognize a relation to external danger but in which we must judge the fear exaggerated out of all proportion. Thirdly and lastly, we find anxiety in hysteria and other forms of severe neurosis, where it either accompanies symptoms or emerges independently as an attack or more persistent state, but always without any visible basis in an external danger. We then asked ourselves two questions: 'What are people afraid of in neurotic anxiety?' and 'How are we to bring it into relation with realistic anxiety felt in the face of external dangers?'

Our investigations were far from remaining unsuccessful: we reached a few important conclusions. In regard to anxious expectation clinical experience revealed that it had a regular connection with the libidinal economics of sexual life [*Sexualleben*]T. The commonest cause of anxiety neurosis is unconsummated excitation. Libidinal excitation is aroused but not satisfied, not employed; apprehensiveness then appears instead of this libido that has been diverted from its employment. I even thought I was justified in saying that this unsatisfied libido was directly changed into anxiety. This view found support in some quite regularly occurring phobias of small children. Many of these phobias are very puzzling to us, but others, such as the fear of being alone and the fear of strangers, can be explained with certainty. Loneliness as well as a strange face arouse the child's longing for his familiar mother; he is unable to control this libidinal excitation, he cannot hold it in suspense but changes it into anxiety. This infantile anxiety must therefore be

Sex

[83]

regarded not as of the realistic but as of the neurotic kind. Infantile phobias and the expectation of anxiety in anxiety neurosis offer us two examples of one way in which neurotic anxiety originates: by a direct transformation of libido. We shall at once come to know of a second mechanism, but it will turn out not to be very different from the first.

For we consider that what is responsible for the anxiety in hysteria and other neuroses is the process of repression. We believe it is possible to give a more complete account of this than before, if we separate what happens to the idea that has to be repressed from what happens to the quota of libido attaching to it. It is the idea which is subjected to repression and which may be distorted to the point of being unrecognizable; but its quota of affect is regularly transformed into anxiety – and this is so whatever the nature of the affect may be, whether it is aggressiveness or love. It makes no essential difference, then, for what reason a quota of libido has become unemployable: whether it is on account of the infantile weakness of the ego, as in children's phobias, or on account of somatic processes in sexual life, as in anxiety neurosis, or owing to repression, as in hysteria. Thus in reality the two mechanisms that bring about neurotic anxiety coincide.

In the course of these investigations our attention was drawn to a highly significant relation between the generation of anxiety and the formation of symptoms – namely, that these two represent and replace each other. For instance, an agoraphobic patient may start his illness with an attack of anxiety in the street. This would be repeated every time he went into the street again. He will now develop the symptom of agoraphobia; this may also be described as an inhibition, a restriction of the ego's functioning, and by means of it he spares himself anxiety attacks. We can witness the converse of this if we interfere in the formation of symptoms, as is possible, for instance, with obsessions. If we [84] prevent a patient from carrying out a washing ceremonial, he falls into a state of anxiety which he finds hard to tolerate and from which he had evidently been protected by his symptom. And it seems, indeed, that the generation of anxiety is the earlier and the formation of symptoms the later of the two, as though the symptoms are created in order to avoid the outbreak of the anxiety state. This is confirmed too by the fact that the first neuroses of childhood are phobias – states in which we see so clearly how an initial generation of anxiety is replaced by the later formation of a symptom; we get an impression that it is from these interrelations that we shall best obtain access to an understanding of neurotic anxiety. And at the same time we have also succeeded in

answering the question of what it is that a person is afraid of in neurotic anxiety and so in establishing the connection between neurotic and realistic anxiety. What he is afraid of is evidently his own libido. The difference between this situation and that of realistic anxiety lies in two points: that the danger is an internal instead of an external one and that it is not consciously recognized.

In phobias it is very easy to observe the way in which this internal danger is transformed into an external one – that is to say, how a neurotic anxiety is changed into an apparently realistic one. In order to simplify what is often a very complicated business, let us suppose that the agoraphobic patient is invariably afraid of feelings of temptation that are aroused in him by meeting people in the street. In his phobia he brings about a displacement and henceforward is afraid of an external situation. What he gains by this is obviously that he thinks he will be able to protect himself better in that way. One can save oneself from an external danger by flight; fleeing from an internal danger is a difficult enterprise.

At the conclusion of my earlier lecture on anxiety I myself expressed the opinion that, although these various findings of our enquiry were not mutually contradictory, somehow they did not fit in with one another. Anxiety, it seems, insofar as it is an affective state, is the reproduction of an old event which brought a threat of danger; anxiety serves the purposes of self-preservation and is a signal of a new danger; it arises from libido that has in some way become unemployable and it also arises during the process of repression; it is replaced by the formation [85]
of a symptom, is, as it were, psychically bound – one has a feeling that something is missing here which would bring all these pieces together into a whole.

Ladies and gentlemen, the dissection of the mental personality into a superego, an ego and an id, which I put before you in my last lecture, has obliged us to take our bearings afresh in the problem of anxiety as well. With the thesis that the ego is the sole seat of anxiety[1] – that the ego alone can produce and feel anxiety – we have established a new and stable position from which a number of things take on a new aspect. And indeed it is difficult to see what sense there would be in speaking of an 'anxiety of the id' or in attributing a capacity for apprehensiveness

1 [This was first stated, in slightly different words, near the end of *The Ego and the Id* (1923*b*), *RSE*, **19**, 51. It was discussed at several points in *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 124, 142, etc. The greater part of what follows on the subject of anxiety is derived from the latter work.]

to the superego. On the other hand, we have welcomed a desirable element of correspondence in the fact that the three main species of anxiety, realistic, neurotic and moral, can be so easily connected with the ego's three dependent relations – to the external world, to the id and to the superego [p. 69 f. above]. Along with this new view, moreover, the function of anxiety as a signal announcing a situation of danger (a notion, incidentally, not unfamiliar to us)[1] comes into prominence, the question of what the material is out of which anxiety is made loses interest, and the relations between realistic and neurotic anxiety have become surprisingly clarified and simplified. It is also to be remarked that we now understand the apparently complicated cases of the generation of anxiety better than those which were considered simple.

For we have recently been examining the way in which anxiety is generated in certain phobias which we class as anxiety hysteria, and have chosen cases in which we were dealing with the typical repression of wishful impulses arising from the Oedipus complex. We should have expected to find that it was a libidinal cathexis of the boy's mother as
[86] object which, as a result of repression, had been changed into anxiety and which now emerged, expressed in symptomatic terms, attached to a substitute for his father. I cannot present you with the detailed steps of an investigation such as this; it will be enough to say that the surprising result was the opposite of what we expected. It was not the repression that created the anxiety; the anxiety was there earlier; it was the anxiety that made the repression.[2] But what sort of anxiety can it have been? Only anxiety in the face of a threatening external danger – that is to say, a realistic anxiety. It is true that the boy felt anxiety in the face of a demand by his libido – in this instance, anxiety at being in love with his mother; so the case was in fact one of neurotic anxiety. But this being in love appeared to him as an internal danger, which he must avoid by renouncing that object, only because it conjured up an external situation of danger. And in every case we examine we obtain the same result. It must be confessed that we were not prepared to find that internal drive danger would turn out to be a determinant and preparation for an external, real, situation of danger.

But we have not made any mention at all so far of what the real danger is that the child is afraid of as a result of being in love with his mother.

1 [Cf. a number of early references in the Editors' Introduction to *Inhibitions, Symptoms and Anxiety* (1926*d*), *RSE*, **20**, 73. The idea appears in *Introductory Lectures*, XXV; ibid., **16**, 348 and 357.]

2 [Cf. Chapter IV of *Inhibitions, Symptoms and Anxiety*, ibid., **20**, 96–7. The cases examined there were those of 'Little Hans' and the 'Wolf Man'.]

The danger is the punishment of being castrated, of losing his genital organ. You will of course object that after all that is not a real danger. Our boys are not castrated because they are in love with their mothers during the phase of the Oedipus complex. But the matter cannot be dismissed so simply. Above all, it is not a question of whether castration is really carried out; what is decisive is that the danger is one that threatens from outside and that the child believes in it. He has some ground for this, for people threaten him often enough with cutting off his penis during the phallic phase,[1] at the time of his early masturbation, and hints at that punishment must regularly find a phylogenetic reinforcement in him. It is our suspicion that during the human family's primaeval period castration used actually to be carried out by a jealous and cruel father upon growing boys, and that circumcision, which so frequently plays a part in puberty rites among primitive peoples, is a clearly recognizable [87] relic of it. We are aware that here we are diverging widely from the general opinion; but we must hold fast to the view that fear of castration is one of the commonest and strongest motives for repression and thus for the formation of neuroses. The analysis of cases in which circumcision, though not, it is true, castration, has been carried out on boys as a cure or punishment for masturbation (a far from rare occurrence in Anglo-American society) has given our conviction a last degree of certainty. It is very tempting at this point to go more deeply into the castration complex, but I will stick to our subject.

Fear of castration is not, of course, the only motive for repression: indeed, it finds no place in women, for though they have a castration complex they cannot have a fear of being castrated. Its place is taken in their sex by a fear of loss of love,[2] which is evidently a later prolongation of the infant's anxiety if it finds its mother absent. You will realize how real a situation of danger is indicated by this anxiety. If a mother is absent or has withdrawn her love from her child, it is no longer sure of the satisfaction of its needs and is perhaps exposed to the most distressing feelings of tension. Do not reject the idea that these determinants of anxiety may at bottom repeat the situation of the original anxiety at birth, which, to be sure, also represented a separation from the mother. Indeed, if you follow a train of thought suggested by Ferenczi [1925], you may add the fear of castration to this series, for a loss of the male organ results in an inability to unite once more with the mother (or a substitute for her) in the sexual act. I may mention to you

1 [This phase is discussed later in this lecture, p. 87.]

2 [Cf. *Inhibitions, Symptoms and Anxiety* (1926*d*), *RSE*, **20**, 126 f.]

incidentally that the very frequent phantasy of returning into the mother's womb is a substitute for this wish to copulate.[1] There would be many interesting things and surprising connections to tell you at this point, but I cannot go outside the framework of an introduction to psychoanalysis. I will only draw your attention to the fact that here psychological researches trench upon the facts of biology.

Otto Rank, to whom psychoanalysis is indebted for many excellent contributions, also has the merit of having expressly emphasized the
[88] significance of the act of birth and of separation from the mother [Rank, 1924]. Nevertheless, we have all found it impossible to accept the extreme inferences which he has drawn from this factor as bearing on the theory of the neuroses and even on analytic therapy. The core of his theory – that the experience of anxiety at birth is the model of all later situations of danger – he found already there.[2] If we dwell on these situations of danger for a moment, we can say that in fact a particular determinant of anxiety (that is, situation of danger) is allotted to every age of development as being appropriate to it. The danger of psychical helplessness fits the stage of the ego's early immaturity; the danger of loss of an object (or loss of love) fits the lack of self-sufficiency in the first years of childhood; the danger of being castrated fits the phallic phase; and finally fear of the superego, which assumes a special position, fits the period of latency. In the course of development the old determinants of anxiety should be dropped, since the situations of danger corresponding to them have lost their importance owing to the strengthening of the ego. But this occurs only most incompletely. Many people are unable to surmount the fear of loss of love; they never become sufficiently independent of other people's love and in this respect carry on their behaviour as infants. Fear of the superego should normally never cease, since, in the form of moral anxiety, it is indispensable in social relations, and only in the rarest cases can an individual become independent of human society. A few of the old situations of danger, too, succeed in surviving into later periods by making contemporary modifications in their determinants of anxiety. Thus, for instance, the danger of castration persists under the mark of syphilidophobia. It is true that as an adult one knows that castration is no longer customary

1 [Cf. *Inhibitions, Symptoms and Anxiety* (1926*d*), *RSE*, **20**, 123.]

2 [Freud had first published it in a footnote added to the second (1909) edition of *The Interpretation of Dreams*, ibid., **5**, 358 *n.* 2, but there is reason to believe that his theory had been known considerably earlier among his adherents in Vienna. See an Editors' footnote to *Introductory Lectures*, XXV; ibid., **16**, 351 *n.* 1. His criticism of Rank's birth theory occurs chiefly in *Inhibitions, Symptoms and Anxiety*, ibid., **20**, 120 f. and 133–5.]

as a punishment for the indulgence of sexual desires, but on the other hand one has learnt that drive liberty of that kind is threatened by serious diseases. There is no doubt that the people we describe as neurotics remain infantile in their attitude to danger and have not surmounted [89] obsolete determinants of anxiety. We may take this as a factual contribution to the characterization of neurotics; it is not so easy to say why it should be so.

I hope you have not lost the thread of what I am saying and remember that we are investigating the relations between anxiety and repression. In the course of this we have learnt two new things: first, that anxiety makes repression and not, as we used to think, the other way round, and [secondly] that the drive situation which is feared goes back ultimately to an external situation of danger. The next question will be: how do we now picture the process of a repression under the influence of anxiety? The answer will, I think, be as follows. The ego notices that the satisfaction of an emerging drive demand would conjure up one of the well-remembered situations of danger. This drive cathexis must therefore be somehow suppressed, stopped, made powerless. We know that the ego succeeds in this task if it is strong and has drawn the drive impulse concerned into its organization. But what happens in the case of repression is that the drive impulse still belongs to the id and that the ego feels weak. The ego thereupon helps itself by a technique which is at bottom identical to normal thinking. Thinking is an experimental action carried out with small amounts of energy, in the same way as a general shifts small figures about on a map before setting his large bodies of troops in motion.[1] Thus the ego anticipates the satisfaction of the [90] questionable drive impulse and permits it to bring about the reproduction of the unpleasurable feelings at the beginning of the feared situation of danger. With this the automatism of the pleasure–unpleasure principle is brought into operation and now carries out the repression of the dangerous drive impulse.

1 [This postponing activity of thought has already been mentioned in the last lecture (pp. 67–8) as one of the main functions of the ego. The conception of thinking as an experimental, small-scale kind of acting – an essential element in 'reality-testing' – is among the earliest and most fundamental of Freud's theories, closely related to his distinction between the primary and secondary psychical processes (cf. p. 66 and footnote 3). It appears first in Sections 16, 17 and 18 of Part I of the 'Project' of 1895 and is discussed again in Section 3 of Part III of the same work (1950*a*). There the discussion is in ostensibly neurological terms, but it reappears as pure psychology in Chapter VII (E) of *The Interpretation* of *Dreams* (1900*a*), *RSE*, **5**, 536–7. It can be found again in the book on *Jokes* (1905*c*), ibid., **8**, 166, in the paper on the 'Two Principles of Mental Functioning' (1911*b*), ibid., **12**, 218, in Section V of 'The Unconscious' (1915*e*), ibid., **14**, 166 f., in Chapter V of *The Ego and the Id* (1923*b*), ibid., **19**, 49, and in 'Negation' (1925*h*), ibid., **19**, 240. It makes a final appearance in Chapter VIII of the *Outline of Psychoanalysis* (1940*a* [1938]), ibid., **23**, 179 f., Freud's last major work.]

'Stop a moment!' you will exclaim; 'we can't follow you any further there!' You are quite right; I must add a little more before it can seem acceptable to you. First, I must admit that I have tried to translate into the language of our normal thinking what must in fact be a process that is neither conscious nor preconscious, taking place between quotas of energy in some unimaginable substratum. But that is not a strong objection, for it cannot be done in any other way. What is more important is that we should distinguish clearly what happens in the ego and what happens in the id when there is a repression. We have just said what the ego does: it makes use of an experimental cathexis and starts up the pleasure–unpleasure automatism by means of a signal of anxiety. After that, several reactions are possible or a combination of them in varying proportions. Either the anxiety attack is fully generated and the ego withdraws entirely from the objectionable excitation; or, in place of the experimental cathexis it opposes the excitation with an anticathexis, and this combines with the energy of the repressed impulse to form a symptom; or the anticathexis is taken up into the ego as a reaction-formation, as an intensification of certain of the ego's dispositions, as a permanent alteration of it.[1] The more the generation of anxiety can be restricted to a mere signal, so much the more does the ego expend on actions of defence [*Abwehraktionen*] which amount to the psychical binding of the repressed [impulse], and so much the closer, too, does the process approximate to a normal working over [*Verarbeitung*] of it,[2] though no doubt without attaining it.

[91] Incidentally, here is a point on which we may dwell for a moment. You yourselves have no doubt assumed that what is known as 'character', a thing so hard to define, is to be ascribed entirely to the ego. We have already made out a little of what it is that creates character. First and foremost there is the incorporation of the former parental agency as a superego, which is no doubt its most important and decisive portion, and, further, identifications with the two parents of the later period and with other influential figures, and similar identifications

1 [This idea of an alteration of the ego as a result of an anticathexis is already to be found in some of Freud's very early writings, e.g. in the second paper on 'The Neuropsychoses of Defence' (1896*b*), *RSE*, **3**, 192 f. It had occurred more recently in *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 139, and was to be discussed further in Sections II and V of the very late technical paper 'Analysis Terminable and Interminable' (1937*c*), ibid., **23**, 198 f. and 211–16.]

2 [The concept of 'working over' as a normal method of dealing with a disagreeable mental event is an old one of Freud's. Thus, in a lecture on hysteria delivered at the date of the Breuer & Freud 'Preliminary Communication', he said: 'Incidentally, a healthy psychical mechanism has other methods of dealing with the affect of a psychical trauma . . . – namely by working it over associatively . . .' (1893*h*), ibid., **3**, 36.]

formed as precipitates of abandoned object relations [cf. p. 57 above]. And we may now add as contributions to the construction of character which are never absent the reaction-formations which the ego acquires – to begin with in making its repressions and later, by a more normal method, when it rejects unwished-for drive impulses.[1]

Now let us go back and turn to the id. It is not so easy to guess what occurs during repression in connection with the drive impulse that is being fought against. The main question which our interest raises is as to what happens to the energy, to the libidinal charge, of that excitation – how is it employed? You recollect that the earlier hypothesis was that it is precisely this that is transformed by repression into anxiety.[2] We no longer feel able to say that. The modest reply will rather be that what happens to it is probably not always the same thing. There is probably an intimate correspondence which we ought to get to know about between what is occurring at the time in the ego and in the id in connection with the repressed impulse. For since we have decided that the pleasure–unpleasure principle, which is set in action by the signal of [92]
anxiety, plays a part in repression, we must alter our expectations. That principle exercises an entirely unrestricted dominance over what happens in the id. We can rely on its bringing about quite profound changes in the drive impulse in question. We are prepared to find that repression will have very various consequences, more or less far-reaching. In some cases the repressed drive impulse may retain its libidinal cathexis, and may persist in the id unchanged, although subject to constant pressure from the ego. In other cases what seems to happen is that it is totally destroyed, while its libido is permanently diverted along other paths. I expressed the view that this is what happens when the Oedipus complex is dealt with normally – in this desirable case, therefore, being not simply repressed but destroyed [*zerstört*] in the id.[3] Clinical experience has further shown us that in many cases, instead of the customary result of repression, a degradation of the libido takes place – a regression of the libidinal organization to an earlier stage. This can, of course, only occur in the id, and if it occurs it will be under the influence of the same conflict which was introduced by the signal of anxiety. The most striking

1 [The earlier part of this paragraph is derived from a discussion at the beginning of Chapter III of *The Ego and the Id* (1923*b*), *RSE*, **19**, 24 ff. The later part is based on Chapter XI (A) of *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 139–40. References to some earlier discussions on character are given in an Editors' footnote to 'Character and Anal Erotism' (1908*b*), ibid., **9**, 154 *n.* 2.]

2 [Cf. the metapsychological paper on 'Repression' (1915*d*), ibid., **14**, 135 ff., and *Introductory Lectures*, XXV; ibid., **16**, 355–7.]

3 [Cf. 'The Dissolution of the Oedipus Complex' (1924*d*), ibid., **19**, 170 f.]

example of this kind is provided by the obsessional neurosis, in which libidinal regression and repression operate together.

I fear, ladies and gentlemen, that you will find this exposition hard to follow, and you will guess that I have not stated it exhaustively. I am sorry to have had to rouse your displeasure. But I can set myself no other aim than to give you an impression of the nature of our findings and of the difficulties involved in working them out. The deeper we penetrate into the study of mental processes the more we recognize their abundance and complexity. A number of simple formulas which to begin with seemed to meet our needs have later turned out to be inadequate. We do not tire of altering and improving them. In my lecture on the theory of dreams [the first in the present series] I introduced you to a region in which for fifteen years there has scarcely been a new discovery. Here, where we are dealing with anxiety, you see everything in a state of flux and change. These novelties, moreover, have not yet been thor-
[93] oughly worked through and perhaps this too adds to the difficulties of demonstrating them. But have patience! We shall soon be able to take leave of the subject of anxiety. I cannot promise that it will have been settled to our satisfaction, but it is to be hoped that we shall have made a little bit of progress. And in the meantime we have made all sorts of new discoveries. Now, for instance, our study of anxiety leads us to add a new feature to our description of the ego. We have said that the ego is weak in comparison with the id, that it is its loyal servant, eager to carry out its orders and to fulfil its demands. We have no intention of withdrawing this statement. But on the other hand this same ego is the better-organized part of the id, with its face turned towards reality. We must not exaggerate the separation between the two of them too much, and we must not be surprised if the ego on its part can bring its influence to bear on the processes in the id. I believe the ego exercises this influence by putting into action the almost omnipotent pleasure–unpleasure principle by means of the signal of anxiety. On the other hand, it shows its weakness again immediately afterwards, for by the act of repression it renounces a portion of its organization and has to allow the repressed drive impulse to remain permanently withdrawn from its influence.

And now, only one more remark on the problem of anxiety. Neurotic anxiety has changed in our hands into realistic anxiety, into fear of particular external situations of danger. But we cannot stop there, we must take another step – though it will be a step backwards. We ask ourselves what it is that is actually dangerous and actually feared in a situation of danger of this kind. It is plainly not the injury to the subject

as judged objectively, for this need be of no significance psychologically, but something brought about by it in the mind. Birth, for instance, our model for an anxiety state, can after all scarcely be regarded on its own account as an injury, although it may involve a danger of injuries. The essential thing about birth, as about every situation of danger, is that it calls up in mental experience a state of highly tense excitation, which is felt as unpleasure and which one is not able to master by discharging it. Let us call a state of this kind, before which the efforts of the pleasure principle break down, a 'traumatic' moment.[1] Then, if we take in succession neurotic anxiety, realistic anxiety and the situation of danger, we arrive at this simple proposition: what is feared, what is the object of the anxiety, is invariably the emergence of a traumatic moment, which cannot be dealt with by the normal rules of the pleasure principle. We understand at once that our endowment with the pleasure principle does not guarantee us against objective injuries but only against a particular injury to our psychical economics. It is a long step from the pleasure principle to the self-preservative drive [*Selbsterhaltungstrieb*][T]; the intentions of the two of them are very far from coinciding from the start. But we see something else besides; perhaps it is the solution we are in search of. Namely, that in all this it is a question of relative quantities. It is only the magnitude of the sum of excitation that turns an impression into a traumatic moment, paralyses the function of the pleasure principle and gives the situation of danger its significance. And if that is how things are, if these puzzles can be solved so prosaically, why should it not be possible for similar traumatic moments to arise in mental life without reference to hypothetical situations of danger – traumatic moments, then, in which anxiety is not aroused as a signal but is generated anew for a fresh reason. Clinical experience declares decidedly that such is in fact the case. It is only the *later* repressions that exhibit the mechanism we have described, in which anxiety is awakened as a signal of an earlier situation of danger. The first and original repressions arise directly from traumatic moments, when the ego meets with an excessively great libidinal demand; they construct their anxiety afresh, although, it is true, on the model of birth. The same may apply to the generation of anxiety in anxiety neurosis owing to somatic damage to the sexual function. We shall no longer maintain that it is the

[94]

Selbsterhaltung

1 [This phrase, with its echo of Charcot, goes back to Freud's very earliest discussions of hysteria. See, for instance, his first paper on 'The Neuropsychoses of Defence' (1894*a*), *RSE*, **3**, 47.]

libido itself that is turned into anxiety in such cases.[1] But I can see no objection to there being a twofold origin of anxiety – one as a direct
[95] consequence of the traumatic moment and the other as a signal threatening a repetition of such a moment.

I feel sure you are rejoicing, ladies and gentlemen, at not having to listen to any more about anxiety. But you have gained nothing by it: what follows is no better. It is my design to introduce you today as well to the field of the libido theory or theory of the drives, where there have equally been a number of new developments. I will not claim that we have made great advances in it, so that it would be worth your taking any amount of trouble to learn about them. No. This is a region in which we are struggling laboriously to find our bearings and make discoveries; you will only be witnesses to our efforts. Here too I shall have to go back to some of the things I told you earlier.

The theory of the drives is so to say our mythology. Drives are mythical entities, magnificent in their indefiniteness. In our work we cannot for a moment disregard them, yet we are never sure that we are seeing them clearly. You know how popular thinking deals with the drives. People assume as many and as various drives as they happen to need at the moment – a self-assertive drive, an imitative drive, a drive to play, a gregarious drive and many others like them. People take them up, as it were, make each of them do its particular job, and then drop them again. We have always been moved by a suspicion that behind all these little *ad hoc* drives there lay concealed something serious and powerful which we should like to approach cautiously. Our first step was modest enough. We told ourselves we should probably not be going astray if we began by separating two main drives or classes of drives or groups of drives in accordance with the two great needs – hunger and love. However jealously we usually defend the independence of psychology from every other science, here we stood in the shadow of the unshakeable biological fact that the living individual organism is at the command of two intentions, self-preservation and the preservation of the species, which seem to be independent of each other, which, so far as we know at present, have no common origin and whose interests are often in conflict in animal life. Actually what we are talking now is biological
[96] psychology, we are studying the psychical accompaniments of biological

1 [In *Inhibitions, Symptoms and Anxiety* Freud still maintained, at least as a possibility, that in anxiety neurosis 'what finds discharge in the generating of anxiety is precisely the surplus of unutilized libido' (1926*d*), *RSE*, **20**, 125. With the present sentence the last trace of the old theory is abandoned.]

processes. It was as representing this aspect of the subject that the 'ego drives' and the 'sexual drives' were introduced into psychoanalysis. We included in the former everything that had to do with the preservation, assertion and magnification of the individual. To the latter we had to attribute the copiousness called for by infantile and perverse sexual life. In the course of investigating the neuroses we came to know the ego as the restricting and repressing power and the sexual trends as the restricted and repressed one; we therefore believed that we had clear evidence not only of the difference between the two groups of drives but also of the conflict between them. The first object of our study was only the sexual drives, whose energy we named 'libido'. It was in relation to them that we sought to clarify our ideas of what a drive is and what is to be attributed to it. Here we have the libido theory.

A drive, then, is distinguished from a stimulus by the fact that it arises from sources of stimulation within the body, that it operates as a constant force and that the subject cannot avoid it by flight, as is possible with an external stimulus. We can distinguish a drive's source, object and aim. Its source is a state of excitation in the body, its aim is the removal of that excitation; on its path from its source to its aim the drive becomes operative psychically. We picture it as a certain quota of energy which presses in a particular direction. It is from this pressing that it derives its name of 'drive'.[1] People speak of 'active' and 'passive' drives, but it would be more correct to speak of drives with active and passive aims: for an expenditure of activity is needed to achieve a passive aim as well. The aim can be achieved in the subject's own body; as a rule an external object is brought in, in regard to which the drive achieves its external aim; its internal aim invariably remains the bodily change which is felt as satisfaction. It has not become clear to us whether the relation of the drive to its somatic source gives it a specific quality and if so what. The evidence of analytic experience shows that it is an undoubted fact that drive impulses from one source attach themselves to those from other sources and share their further vicissitudes and that [97]
in general one drive satisfaction can be replaced by another. But it must be admitted that we do not understand this very well. The relations of a drive to its aim and object are also open to alterations; both can be exchanged for other ones, though its relation to its object is nevertheless the more easily loosened. A certain kind of modification of the aim and change of the object, in which our social valuation is taken into account,

1 [This is a clear instance of one of the difficulties with the previous English translation of '*Trieb*' as 'instinct'. See *RSE*, **24**, 85–8.]

is described by us as 'sublimation'. Besides this, we have grounds for distinguishing drives which are 'inhibited in their aim' – drive impulses from sources well known to us with an unambiguous aim, but which come to a stop on their way to satisfaction, so that a lasting object cathexis comes about and a permanent trend [of feeling]. Such, for instance, is the relation of tenderness, which undoubtedly originates from the sources of sexual need and invariably renounces its satisfaction.[1]

You see how many of the characteristics and vicissitudes of the drives still escape our comprehension. A further distinction should be mentioned here which is exhibited between the sexual and self-preservative drives and which would be of the greatest theoretical importance if it applied to the groups as a whole. The sexual drives are noticeable to us for their plasticity, their capacity for altering their aims, their replaceability, which admits of one drive satisfaction being replaced by another, and their readiness for being deferred, of which we have just given a good example in the aim-inhibited drives. We should be glad to deny these characteristics to the self-preservative drives, and to say of them that they are inflexible, admit of no delay, are imperative in a very different sense and have a quite other relation to repression and to anxiety. But a little reflection tells us that this exceptional position applies, not to all the ego drives, but only to hunger and thirst, and is evidently based on a peculiar character of the sources of those drives. A good part of the confusing impression made by all this is that we have not given separate consideration to the alterations which the influence of the organized ego makes in the drive impulses that belonged originally to the id.

[98] We find ourselves on firmer ground when we investigate the manner in which the life of the drives serves the sexual function [*Sexualfunktion*]. Here we have acquired quite definite knowledge, with which you too are already familiar. It is not the case, then, that we recognize a sexual drive which is from the first the vehicle of an urge towards the aim of the sexual function – the union of the two sex cells [*Geschlechtszellen*]. What we see is a great number of component drives arising from different areas and regions of the body, which strive for satisfaction fairly independently of one another and find that satisfaction in something that we may call 'organ pleasure'.[2] The genitals are the latest of

1 [The contents of this paragraph are largely repeated from the first portion of 'Drives and their Vicissitudes' (1915*c*), *RSE*, **14**, 104–10.]

2 [This term had been discussed by Freud at some length in *Introductory Lectures*, XXI; ibid., **16**, 285–6. The same lecture covers the contents of much of the first part of the present paragraph.]

these 'erotogenic zones' and the name of 'sexual' pleasure [*Lust*] cannot be withheld from their organ pleasure. These impulses which strive for pleasure are not all taken up into the final organization of the sexual function. A number of them are set aside as unserviceable, by repression or some other means; a few of them are diverted from their aim in the remarkable manner I have mentioned [pp. 85–6 above] and used to strengthen other impulses; yet others persist in minor roles, and serve for the performance of introductory acts, for the production of fore-pleasure.[1] You have heard how in the course of this long-drawn-out development several phases of preliminary organization can be recognized and also how this history of the sexual function explains its aberrations and atrophies. The first of these 'pregenital' phases is known to us as the *oral* one because, in conformity with the way in which an infant in arms is nourished, the erotogenic zone of the mouth dominates what may be called the sexual activity of that period of life. At a second level the *sadistic* and *anal* impulsions come to the fore, undoubtedly in connection with the appearance of the teeth, the strengthening of the muscular apparatus and the control of the sphincter functions. We have learnt a number of interesting details about this remarkable stage of development in particular.[2] Thirdly comes the *phallic* phase in which in both sexes the male organ (and what corresponds to it in girls) attains [99] an importance which can no longer be overlooked.[3] We have reserved the name of *genital* phase for the definitive sexual organization which is established after puberty and in which the female genital organ for the first time meets with the recognition which the male one acquired long before.

So far all this is trite repetition. And you must not suppose that the many things I have not mentioned this time no longer hold good. This repetition was necessary so that I might use it as the starting point for a report on the advances in our knowledge. We can boast of having learnt much that is new, particularly about the early organizations of the libido, and of having obtained a clearer grasp of the significance of what is old; and I will give you at least a few examples to demonstrate this. Abraham showed in 1924 that two stages can be distinguished in the sadistic-anal phase. The earlier of these is dominated by the

1 [A long discussion of fore-pleasure is given in the third of Freud's *Three Essays on the Theory of Sexuality* (1905*d*), *RSE*, **7**, 186–7. One or two further references can be found in an Editors' footnote to the book on *Jokes* (1905*c*), ibid., **8**, 120 *n.* 2, in which volume the subject recurs at several points.]

2 [These are discussed below, pp. 88–90.]

3 [See 'The Infantile Genital Organization' (1923*e*), *RSE*, **19**.]

destructive trends of destroying and losing, the later one by trends friendly towards objects – those of keeping and possessing. It is in the middle of this phase, therefore, that consideration for the object makes its first appearance as a precursor of a later erotic cathexis. We are equally justified in making a similar subdivision in the first, oral phase. In the first substage what is in question is only oral incorporation, there is no ambivalence at all in the relation to the object – the mother's breast. The second stage, characterized by the emergence of the biting activity, may be described as the 'oral-sadistic' one; it exhibits for the first time the phenomena of ambivalence, which become so much clearer afterwards, in the following sadistic-anal phase. The value of these new distinctions is to be seen especially if we look for the dispositional points in the development of the libido in the case of particular neuroses, such as obsessional neurosis or melancholia.[1] You must here recall to mind what we have learnt about the connection between fixation of the libido, disposition and regression.[2]

[100] Our attitude to the phases of the organization of the libido has in general shifted a little. Whereas earlier we chiefly emphasized the way in which each of them passed away before the next, our attention now is directed to the facts that show us how much of each earlier phase persists alongside of and behind the later configurations and obtains a permanent representation in the libidinal economy and character of the subject. Still more significant have studies become which have taught us how frequently under pathological conditions regressions to earlier phases occur and that particular regressions are characteristic of particular forms of illness.[3] But I cannot go into that here, it forms part of the specialized psychology of the neuroses.

We have been able to study transformations of drive and similar processes particularly in anal erotism, the excitations arising from the sources of the erotogenic anal zone, and we were surprised at the multiplicity of uses to which these drive impulses are put. It may not be easy, perhaps, to get free from the contempt into which this particular zone has fallen in the course of evolution. Let us therefore allow ourselves to be reminded by Abraham that embryologically the anus corresponds to the primitive mouth, which has migrated down to the end of the bowel.[4]

1 [I.e. the points in libidinal development at which a fixation lays down a disposition to some particular neurosis. Cf. 'The Disposition to Obsessional Neurosis' (1913*i*), *RSE*, **12**. The term 'dispositional point' occurs in the Schreber analysis (1911*c*), ibid., **12**, 53.]

2 [In *Introductory Lectures*, XXII; ibid., **16**.]

3 [This is probably once again a reference to Abraham's important publication of 1924.]

4 [Abraham, 1924; English translation, p. 500.]

We have learnt, then, that after a person's own faeces, his excrement, has lost its value for him, this drive interest derived from the anal source passes over on to objects that can be presented as *gifts*. And this is rightly so, for faeces were the first gift that an infant could make, something he could part with out of love for whoever was looking after him. After this, corresponding exactly to analogous changes of meaning that occur in linguistic development, this ancient interest in faeces is transformed into the high valuation of *gold* and *money* but also makes a contribution to the affective cathexis of *baby* and *penis*. It is a universal conviction among children, who long retain the cloaca theory, that babies are born from the bowel like a piece of faeces:[1] defaecation is the model of the act of birth. But the penis, too, has its forerunner in the column of faeces [101]
[*Kotsäule*][t] which fills and stimulates the mucous membrane of the bowel. When a child, unwillingly enough, comes to realize that there are human creatures who do not possess a penis, that organ appears to him as something detachable from the body and becomes unmistakably analogous to the excrement, which was the first piece of bodily material that had to be renounced. A great part of anal erotism is thus carried over into a cathexis of the penis. But the interest in that part of the body has, in addition to its anal-erotic root, an oral one which is perhaps more powerful still: for when sucking has come to an end, the penis also becomes heir to the mother's nipple.

If one is not aware of these profound connections, it is impossible to find one's way about in the phantasies of human beings, in their associations, influenced as they are by the unconscious, and in their symptomatic language. Faeces–money–gift–baby–penis are treated there as though they meant the same thing, and they are represented too by the same symbols. Nor must you forget that I have been able to give you only very incomplete information. I may hurriedly add, perhaps, that interest in the vagina, which awakens later, is also essentially of anal-erotic origin. This is not to be wondered at, for the vagina itself, to borrow an apt phrase from Lou Andreas-Salomé [1916], is 'taken on lease' from the rectum:[2] in the life of homosexuals, who have failed to accomplish some part of normal sexual development, the vagina is once more represented by it. In dreams a locality often appears which was earlier a simple room but is now divided into two by a wall, or the other way round. This always means the relation of

1 [Cf. Freud's early paper on 'The Sexual Theories of Children' (1908*c*), *RSE*, **9**, 190–1.]

2 [Her paper was summarized by Freud in a footnote added in 1920 to the second of his *Three Essays* (1905*d*), ibid., **7**, 166 *n*.]

the vagina to the bowel.[1] It is also easy to follow the way in which in girls what is an entirely unfeminine wish to possess a penis is normally transformed into a wish for a baby, and then for a man as the bearer of the penis and giver of the baby; so that here we can see too how a portion of what was originally anal-erotic interest obtains admission into the later genital organization.[2]

[102] During our studies of the pregenital phases of the libido we have also gained a few fresh insights into the formation of character. We noticed a triad of character traits which are found together with fair regularity: orderliness, parsimoniousness and obstinacy; and we inferred from the analysis of people exhibiting these traits that they have arisen from their anal erotism becoming absorbed and employed in a different way. We therefore speak of an 'anal character' in which we find this remarkable combination and we draw a contrast to some extent between the anal character and unmodified anal erotism.[3] We also discovered a similar but perhaps still firmer link between ambition and urethral erotism. A striking allusion to this connection is to be seen in the legend that Alexander the Great was born during the same night in which a certain Herostratus set fire to the celebrated temple of Artemis at Ephesus out of a sheer desire for fame. So the ancients would seem not to have been unaware of the connection. You know, of course, how much urination has to do with fire and extinguishing fire.[4] We naturally expect that other character traits as well will turn out similarly to be precipitates or reaction-formations related to particular pregenital libidinal structures; but we have not yet been able to show this.

It is now time, however, for me to go back both in history and in my subject matter and once more to take up the most general problems of the drives. To begin with, the opposition between the ego drives and the sexual drives lay at the base of our libido theory. When later on we began to study the ego itself more closely and arrived at the conception of narcissism, this distinction itself lost its foundation. In rare cases one

1 [This example had been added in 1919 to Chapter VI (E) of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 317.]

2 [The greater part of the last two paragraphs is derived from 'Transformations of Drive' (1916–17*e*), ibid., **17**, 115 ff., but there are a few additional points here. The subject had already been alluded to in *Introductory Lectures*, XX; ibid., **16**, 277 f.]

3 [These connections had in fact been indicated in quite an early paper of Freud's, 'Character and Anal Erotism' (1908*b*), ibid., **9**, 149.]

4 [Freud had very recently devoted a short paper to this subject (1932*a*), which is included in the present volume, p. 201 ff. below, and where a very full list of other references can be found in the Editors' Note.]

can observe that the ego has taken itself as an object and is behaving as though it were in love with itself. Hence the term 'narcissism', borrowed from the Greek myth.[1] But that is only an extreme exaggeration of a [103]
normal state of affairs. We came to understand that the ego is always the main reservoir of libido, from which libidinal cathexes of objects go out and into which they return again, while the major part of this libido remains permanently in the ego.[2] Thus ego libido is being constantly changed into object libido and object libido into ego libido. But in that case they could not be different in their nature and it could have no sense to distinguish the energy of the one from the energy of the other; we could either drop the term 'libido' or use it as synonymous with psychical energy in general.

We did not maintain this position for long. Our feeling of there being a contrariety in the life of the drives soon found another and sharper expression. It is not my wish, however, to put before you the origin of this novelty in the theory of the drives; it too is based essentially on biological considerations. I shall offer it to you as a ready-made product. Our hypothesis is that there are two essentially different classes of drives: the sexual drives, understood in the widest sense – Eros, if you prefer that name – and the aggressive drives, whose aim is destruction. When it is put to you like this, you will scarcely regard it as a novelty. It looks like an attempt at a theoretical transfiguration of the commonplace opposition between loving and hating, which coincides, perhaps, with the other polarity, of attraction and repulsion, which physics assumes in the inorganic world. But it is a remarkable thing that this hypothesis is nevertheless felt by many people as an innovation and, indeed, as a most undesirable one which should be got rid of as quickly as possible. I presume that a strong affective factor is coming into effect in this rejection. Why have we ourselves needed such a long time before we decided to recognize an aggressive drive? Why did we hesitate to make use, on behalf of our theory, of facts which were obvious and familiar to everyone? We should probably have met with little resistance if we had wanted to ascribe a drive with such an aim to animals. But to include it in the human constitution appears sacrilegious; it contradicts [104]
too many religious presumptions and social conventions. No, man must be naturally good or at least good-natured. If he occasionally shows

1 [Of Narcissus, who was in love with himself.]

2 [But cf. the statement on p. 68 above that 'the object cathexes spring from the drive demands of the id'. See also, however, the reference to a combined ego and id with regard to the destructive drive on p. 93 below. The whole matter is discussed at length in the Editors' Appendix B to *The Ego and the Id* (1923*b*), *RSE*, **19**, 56 ff. See also ibid., **24**, 68–72.]

himself brutal, violent or cruel, these are only passing disturbances of his emotional life, for the most part provoked, or perhaps only consequences of the inexpedient social regulations which he has hitherto imposed on himself.

Unfortunately what history tells us and what we ourselves have experienced does not speak in this sense but rather justifies a judgement that belief in the 'goodness' of human nature is one of those evil illusions by which mankind expect their lives to be beautified and made easier while in reality they only cause damage. We need not continue this controversy, since we have argued in favour of a special aggressive and destructive drive in men not on account of the teachings of history or of our experience in life but on the basis of general considerations to which we were led by examining the phenomena of sadism and masochism. As you know, we call it sadism when sexual satisfaction is linked to the condition of the sexual object's suffering pain, ill-treatment and humiliation, and masochism when the need is felt of being the ill-treated object oneself. As you know too, a certain admixture of these two trends is included in normal sexual relations, and we speak of perversions when they push the other sexual aims into the background and replace them with their own aims.[1] And you will scarcely have failed to notice that sadism has a more intimate relation with masculinity and masochism with femininity, as though there were a secret kinship present; though I must add that we have made no progress along that path. Both phenomena, sadism and masochism alike, but masochism quite especially, present a truly puzzling problem to the libido theory; and it is only proper if what was a stumbling block for the one theory should become the cornerstone of the theory replacing it.

It is our opinion, then, that in sadism and in masochism we have before us two excellent examples of a mixture of the two classes of drives, of Eros and aggressiveness; and we proceed to the hypothesis that this relation is a model one – that every drive impulse that we can
[105] examine consists of similar fusions or alloys of the two classes of drives. These fusions, of course, would be in the most varied ratios. Thus the erotic drives would introduce the multiplicity of their sexual aims into the fusion, while the others would only admit of mitigations or gradations in their monotonous trend. This hypothesis opens a prospect to us of investigations which may some day be of great importance for the understanding of pathological processes. For fusions may also come apart, and we may expect that functioning will be most gravely affected

1 [For this see *Introductory Lectures*, XX and XXI, particularly *RSE*, **16**, 283–5.]

by defusions of such a kind. But these conceptions are still too new; no-one has yet tried to apply them in our work.[1]

Let us go back to the special problem presented to us by masochism. If for a moment we leave its erotic components on one side, it affords us a guarantee of the existence of a trend that has self-destruction as its aim. If it is true of the destructive drive as well [as of the libido] that the ego – but what we have in mind here is rather the id, the whole person[2] – originally includes all the drive impulses, we are led to the view that masochism is older than sadism, and that sadism is the destructive drive directed outwards, thus acquiring the characteristic of aggressiveness. A certain amount of the original destructive drive may still remain in the interior. It seems that we can perceive it only under two conditions: if it is combined with erotic drives into masochism or if – with a greater or lesser erotic addition – it is directed against the external world as aggressiveness. And now we are struck by the significance of the possibility that the aggressiveness may not be able to find satisfaction in the external world because it comes up against real obstacles. If this happens, it will perhaps retreat and increase the amount of self-destructiveness holding sway in the interior. We shall hear how this is in fact what occurs and how important a process this is. Impeded aggressiveness seems to involve a grave injury. It really seems as though it is necessary for us to destroy some other thing or person in order not to destroy ourselves, in order to guard against the impulsion to self-destruction. A sad disclosure indeed for the moralist!

But the moralist will console himself for a long time to come with the improbability of our speculations. A peculiar drive indeed, directed to [106] the destruction of its own organic home! Poets, it is true, talk of such things; but poets are irresponsible people and enjoy the privilege of poetic licence. Incidentally, such ideas are not foreign even to physiology: consider the notion, for instance, of the mucous membrane of the stomach digesting itself. It must be admitted, however, that our self-destructive drive calls for support on a wider basis. One cannot, after all, venture on a hypothesis of such a wide range merely because a few poor fools have linked their sexual satisfaction to a peculiar condition. A more profound study of the drives will, I believe, give us what we need. The drives rule not only mental but also vegetative life, and these organic drives exhibit a characteristic which deserves our deepest

1 [See for this question Chapter IV of *The Ego and the Id* (1923*b*), *RSE*, **19**, 35 ff.]

2 [Cf. footnote 2, p. 91 above.]

interest. (We shall not be able to judge until later whether it is a general characteristic of drives.) For they reveal an effort to restore an earlier state of things. We may suppose that from the moment at which a state of things that has once been attained is upset, a drive arises to create it afresh and brings about phenomena which we can describe as a 'compulsion to repeat' [*Wiederholungszwang*]. Thus the whole of embryology is an example of the compulsion to repeat. A power of regenerating lost organs extends far up into the animal kingdom, and the drive to recovery to which, alongside of therapeutic assistance, our cures are due must be the residue of this capacity which is so enormously developed in the lower animals. The spawning migrations of fishes, the migratory flights of birds, and possibly all that we describe as manifestations of instinct [*Instinkt*][1] in animals, take place under the orders of the compulsion to repeat, which expresses the *conservative nature* of the drives [*Triebe*]. Nor have we far to look in the mental field for its manifestations. We have been struck by the fact that the forgotten and repressed experiences of childhood are reproduced during the work of analysis in dreams and reactions, particularly in those occurring in the transference, although their revival runs counter to the interest of the pleasure principle;[2] and we have explained this by supposing that in these cases a compulsion to repeat is overcoming even the pleasure principle. Outside analysis, too, something similar can be observed. There are people in whose lives the same reactions are perpetually being repeated uncor-
[107] rected, to their own detriment, or others who seem to be pursued by a relentless fate, though closer investigation teaches us that they are unwittingly bringing this fate on themselves. In such cases we attribute a 'demonic' character to the compulsion to repeat.

But how can this conservative characteristic of drives help us to understand our self-destructiveness? What earlier state of things does a drive such as this want to restore? Well, the answer is not far to seek and opens wide perspectives. If it is true that – at some immeasurably remote time and in a manner we cannot conceive – life once proceeded out of inorganic matter, then, according to our presumption, a drive must have arisen which sought to do away with life once more and to re-establish the inorganic state. If we recognize in this drive the self-destructiveness of our hypothesis, we may regard the self-destructiveness as an expression of a 'death drive' which cannot fail to

1 [This is a clear instance of a second major difficulty with the previous English translation of '*Trieb*' as 'instinct'. See p. 85 *n*. above.]

2 [Cf. p. 26 f. above.]

be present in every vital process. And now the drives that we believe in divide themselves into two groups – the erotic drives, which seek to combine more and more living substance into ever greater unities, and the death drives, which oppose this effort and lead what is living back into an inorganic state. From the concurrent and opposing action of these two proceed the phenomena of life which are brought to an end by death.

You may perhaps shrug your shoulders and say: 'That isn't natural science, it's Schopenhauer's philosophy!' But, ladies and gentlemen, why should not a bold thinker have guessed something that is afterwards confirmed by sober and painstaking detailed research? Moreover, there is nothing that has not been said already, and similar things had been said by many people before Schopenhauer. Furthermore, what we are saying is not even genuine Schopenhauer. We are not asserting that death is the only aim of life; we are not overlooking the fact that there is life as well as death. We recognize two basic drives and give each of them its own aim. How the two of them are mingled in the process of living, how the death drive is made to serve the purposes of Eros, especially by being turned outwards as aggressiveness – these are tasks which are left to future investigation. We have not gone beyond the point at which this prospect lies open before us. The question, too, of whether the conservative character may not belong to all drives without exception, whether the erotic drives as well may not be seeking to bring back an earlier state of things when they strive to bring about a synthesis of living things into greater unities – this question, too, we must leave unanswered.[1] [108]

We have travelled somewhat far from our basis. I will tell you in retrospect [*nachträglich*] the starting point of these reflections on the theory of the drives. It was the same as that which led us to revise the relation between the ego and the unconscious – the impression derived from the work of analysis that the patient who puts up a resistance is so often unaware of that resistance. Not only the fact of the resistance is unconscious to him, however, but its motives as well. We were obliged to search out these motives or this motive, and to our surprise we found them in a powerful need for punishment which we could only class with masochistic wishes. The practical significance of this discovery is not

1 [This discussion of the compulsion to repeat and of the death drive is almost wholly derived from *Beyond the Pleasure Principle* (1920*g*), *RSE*, **18**, 7 ff. A fuller account of masochism can be found in the rather later paper 'The Economic Problem of Masochism' (1924*c*), ibid., **19**, 151 ff.]

less than its theoretical one, for the need for punishment is the worst enemy of our therapeutic efforts. It is satisfied by the suffering which is linked to the neurosis, and for that reason holds fast to being ill. It seems that this factor, an unconscious need for punishment, has a share in every neurotic illness. And here those cases in which the neurotic suffering can be replaced by suffering of another kind are wholly convincing. I will report an experience of this kind.

I once succeeded in freeing an unmarried woman, no longer young, from the complex of symptoms which had condemned her for some fifteen years to an existence of torment and had excluded her from any participation in life. She now felt she was well, and she plunged into eager activity, in order to develop her by no means small talent and to snatch a little recognition, enjoyment and success, late though the moment was. But every one of her attempts ended either with people letting her know or with herself recognizing that she was too old to accomplish anything in that field. After each outcome of this kind a relapse into illness would have been the obvious thing, but she was no
[109] longer able to bring that about. Instead, she met each time with an accident which put her out of action for a time and caused her suffering. She fell down and sprained her ankle or hurt her knee, or she injured her hand in something she was doing. When she was made aware of how great her own share might be in these apparent accidents, she, so to say, changed her technique. Instead of accidents, indispositions appeared on the same provocations – catarrhs, sore throats, influenzal conditions, rheumatic swellings – till at last she made up her mind to resign her attempts and the whole agitation came to an end.

There is, as we think, no doubt about the origin of this unconscious need for punishment. It behaves like a piece of conscience, like a prolongation of our conscience into the unconscious; and it must have the same origin as conscience and correspond, therefore, to a piece of aggressiveness that has been internalized and taken over by the superego. If only the words went together better, we should be justified for all practical purposes in calling it an 'unconscious sense of guilt'. Theoretically we are in fact in doubt whether we should suppose that all the aggressiveness that has returned from the external world is bound by the superego and accordingly turned against the ego, or that a part of it is carrying on its mute and uncanny activity as a free destructive drive in the ego and the id. A distribution of the latter kind is the more probable; but we know nothing more about it. There is no doubt that, when the superego was first instituted, in equipping that agency

use was made of the piece of the child's aggressiveness towards his parents for which he was unable to effect a discharge outwards on account of his erotic fixation as well as of external difficulties; and for that reason the severity of the superego need not simply correspond to the strictness of the upbringing [see p. 56 above]. It is very possible that, when there are later occasions for suppressing aggressiveness, the drive may take the same path that was opened to it at that decisive point of time.

People in whom this unconscious sense of guilt is excessively strong betray themselves in analytic treatment by the negative therapeutic reaction which is so disagreeable from the prognostic point of view.[1] When one has given them the solution to a symptom, which should [110] normally be followed by at least its temporary disappearance, what they produce instead is a momentary exacerbation of the symptom and of the illness. It is often enough to praise them for their behaviour in the treatment or to say a few hopeful words about the progress of the analysis in order to bring about an unmistakable worsening of their condition. A non-analyst would say that the 'will to recovery' was absent. If you follow the analytic way of thinking, you will see in this behaviour a manifestation of the unconscious sense of guilt, for which being ill, with its sufferings and impediments, is just what is wanted. The problems which the unconscious sense of guilt has opened up, its connections with morality, education, crime and delinquency, are at present the preferred field of work for psychoanalysts.[2]

And here, at an unexpected point, we have emerged from the psychical underworld into the open marketplace. I cannot lead you any further, but before I take leave of you for today I must detain you with one more train of thought. It has become our habit to say that our civilization [*Kultur*] has been built up at the cost of sexual trends which, being inhibited by society, are partly, it is true, repressed but have partly been made usable for other aims. We have admitted, too, that, in spite of all our pride in our cultural attainments, it is not easy for us to fulfil the requirements of this civilization or to feel comfortable in it, because the restrictions of drive imposed on us constitute a heavy psychical burden. Well, what we have come to see about the sexual drives applies equally and perhaps still more to the other ones, the aggressive drives. It is they above all that make human communal life difficult and

1 [See a long footnote in Chapter V of *The Ego and the Id* (1923*b*), *RSE*, **19**, 45 *n*.]

2 [The main discussions of the sense of guilt can be found in Chapter V of *The Ego and the Id* (1923*b*), ibid., **19**, 44 f., 'The Economic Problem of Masochism' (1924*c*), ibid., **19**, 157 f., and Chapters VII and VIII of *Civilization and its Discontents* (1930*a*), ibid., **21**, 111–15 and 121–5.]

threaten its survival. Restriction of the individual's aggressiveness is the first and perhaps the severest sacrifice which society requires of him. We have learnt the ingenious way in which the taming of this unruly thing has been achieved. The institution of the superego, which takes over the dangerous aggressive impulses, introduces a garrison [*Besatzung*], as it were, into regions that are inclined to rebellion. But on the other hand,
[111] if we look at it purely psychologically, we must recognize that the ego does not feel happy in being thus sacrificed to the needs of society, in having to submit to the destructive trends of aggressiveness which it would have been glad to employ itself against others. It is like a prolongation in the mental sphere of the dilemma of 'eat or be eaten' which dominates the organic animate world. Luckily the aggressive drives are never alone but always alloyed with the erotic ones. These latter have much to mitigate and much to avert under the conditions of the civilization which mankind has created.[1]

1 [The aggressive and destructive drives had been discussed at length by Freud shortly before in *Civilization and its Discontents* (1930*a*), particularly in Chapters V and VI, and the history of his views on the subject is traced in the Editors' Introduction to that work, *RSE*, **21**, 57–8.]

LECTURE XXXIII

FEMININITY[1]

Ladies and Gentlemen, all the while I am preparing to talk to you I am [112]
struggling with an internal difficulty. I feel uncertain, so to speak, of the extent of my licence. It is true that in the course of fifteen years of work psychoanalysis has changed and grown richer; but, in spite of that, an introduction to psychoanalysis might have been left without alteration or supplement. It is constantly in my mind that these lectures are without a raison d'être. For analysts I am saying too little and nothing at all that is new; but for you I am saying too much and saying things which you are not equipped to understand and which are not in your province. I have looked around for excuses and I have tried to justify each separate lecture on different grounds. The first one, on the theory of dreams, was supposed to put you back again at one blow into the analytic atmosphere and to show you how durable our views have turned out to be. I was led on to the second one, which followed the paths from dreams to what is called occultism, by the opportunity of speaking my mind without constraint on a department of work in which prejudiced expectations are fighting today against passionate resistances, and I could hope that your judgement, educated to tolerance on the example of psychoanalysis, would not refuse to accompany me on the excursion. The third lecture, on the dissection of the personality, certainly made the hardest demands upon you with its unfamiliar subject matter; but it was impossible for me to keep this first beginning of an ego psychology back from you, and if we had possessed it fifteen years ago I should have had to mention it to you then. My last lecture, finally, which you were probably able to follow only by great exertions, brought forward [113]
necessary corrections – fresh attempts at solving the most important conundrums; and my introduction would have been leading you astray
